

## Acerca de este libro

Esta es una copia digital de un libro que, durante generaciones, se ha conservado en las estanterías de una biblioteca, hasta que Google ha decidido escanearlo como parte de un proyecto que pretende que sea posible descubrir en línea libros de todo el mundo.

Ha sobrevivido tantos años como para que los derechos de autor hayan expirado y el libro pase a ser de dominio público. El que un libro sea de dominio público significa que nunca ha estado protegido por derechos de autor, o bien que el período legal de estos derechos ya ha expirado. Es posible que una misma obra sea de dominio público en unos países y, sin embargo, no lo sea en otros. Los libros de dominio público son nuestras puertas hacia el pasado, suponen un patrimonio histórico, cultural y de conocimientos que, a menudo, resulta difícil de descubrir.

Todas las anotaciones, marcas y otras señales en los márgenes que estén presentes en el volumen original aparecerán también en este archivo como testimonio del largo viaje que el libro ha recorrido desde el editor hasta la biblioteca y, finalmente, hasta usted.

## Normas de uso

Google se enorgullece de poder colaborar con distintas bibliotecas para digitalizar los materiales de dominio público a fin de hacerlos accesibles a todo el mundo. Los libros de dominio público son patrimonio de todos, nosotros somos sus humildes guardianes. No obstante, se trata de un trabajo caro. Por este motivo, y para poder ofrecer este recurso, hemos tomado medidas para evitar que se produzca un abuso por parte de terceros con fines comerciales, y hemos incluido restricciones técnicas sobre las solicitudes automatizadas.

Asimismo, le pedimos que:

- + *Haga un uso exclusivamente no comercial de estos archivos* Hemos diseñado la Búsqueda de libros de Google para el uso de particulares; como tal, le pedimos que utilice estos archivos con fines personales, y no comerciales.
- + *No envíe solicitudes automatizadas* Por favor, no envíe solicitudes automatizadas de ningún tipo al sistema de Google. Si está llevando a cabo una investigación sobre traducción automática, reconocimiento óptico de caracteres u otros campos para los que resulte útil disfrutar de acceso a una gran cantidad de texto, por favor, envíenos un mensaje. Fomentamos el uso de materiales de dominio público con estos propósitos y seguro que podremos ayudarle.
- + *Conserve la atribución* La filigrana de Google que verá en todos los archivos es fundamental para informar a los usuarios sobre este proyecto y ayudarles a encontrar materiales adicionales en la Búsqueda de libros de Google. Por favor, no la elimine.
- + *Manténgase siempre dentro de la legalidad* Sea cual sea el uso que haga de estos materiales, recuerde que es responsable de asegurarse de que todo lo que hace es legal. No dé por sentado que, por el hecho de que una obra se considere de dominio público para los usuarios de los Estados Unidos, lo será también para los usuarios de otros países. La legislación sobre derechos de autor varía de un país a otro, y no podemos facilitar información sobre si está permitido un uso específico de algún libro. Por favor, no suponga que la aparición de un libro en nuestro programa significa que se puede utilizar de igual manera en todo el mundo. La responsabilidad ante la infracción de los derechos de autor puede ser muy grave.

## Acerca de la Búsqueda de libros de Google

El objetivo de Google consiste en organizar información procedente de todo el mundo y hacerla accesible y útil de forma universal. El programa de Búsqueda de libros de Google ayuda a los lectores a descubrir los libros de todo el mundo a la vez que ayuda a autores y editores a llegar a nuevas audiencias. Podrá realizar búsquedas en el texto completo de este libro en la web, en la página <http://books.google.com>

---

This is a reproduction of a library book that was digitized by Google as part of an ongoing effort to preserve the information in books and make it universally accessible.

# **ELECTRICAL ENGINEERING**

With which is incorporated

**THE ELECTRICAL ENGINEER**

(Established 1884)

---

**VOL. IX.**

**JANUARY TO DECEMBER, 1913**

---

**PUBLISHED BY THE KILOWATT PUBLISHING CO., LTD., 203-206, TEMPLE CHAMBERS,  
TEMPLE AVENUE, LONDON, E.C.**

# INDEX TO "ELECTRICAL ENGINEERING"

VOL. IX. 1913.

	PAGE		PAGE
GENERAL INDEX .....	iii	QUESTIONS AND ANSWERS BY PRACTICAL MEN...	vii
ELECTRICAL ENGINEERING IN THE MINING AND		PATENTS .....	viii
METAL INDUSTRIES .....	v	LOCAL NOTES (including "Tenders Invited and Prospective Business," and "Tenders Received and Accepted")	ix
REVIEWS .....	v	COMPANIES' DIVIDENDS, REPORTS, MEETINGS, ETC.	xi
ELECTRIC TRACTION .....	vi	NEW COMPANIES .....	xi
TELEPHONY AND TELEGRAPHY (Including Wireless)	vii		

## GENERAL INDEX

- Accidents: Explosions, (Bray), 27, 543; (Hebburn), 228, 252, 295, 519, 597, 658; (New York), 602, 630; Fires 16, 140, 296, 369, 441, 466, 496, 589, 724; Interruptions to Supply, (Ashton-under-Lyne), 67; (Brighton), 25; (Charing Cross and City), 589; (Dundee), 692, 710; (Exeter), 609; (Fife), 473; (Leicester), 95; (Manchester), 88; (Met. Elec. Sup.), 590, 607; (New Brighton), 435; (Salford), 9; Shocks, 72, 252, 382, 512, 520, 575, 628; Miscellaneous, 275, 312, 403, 610
- Accrington Elec. Works, 488, 510, 587
- Advertising (Associated Municipal Elec. Engineers), 672; (B.T.H.), 72; (Ediswan), 598; (G.E.C.), 595, 690, 731; [PALMER], 99; (Siemens), 656
- Agriculture [PRIESTLEY], 603
- Air Filters (Balcke), 442; [CHRISTIE], 373, 397
- Air Pumps (Willans & Robinson), 545
- Ambulances, 685, 719
- Arc Lamps, 525
- Assoc. of Consulting Engineers, 205, 423
- Assoc. of Elec. Station Engineers, 90, 170
- Assoc. of Engineers-in-Charge, 566
- Asylum, 321
- Atmosphere [RUTHERFORD], 272
- Ball Bearings [GOODMAN], 724
- Bankruptcies, 16, 28, 110, 124, 180, 196, 210, 282, 312, 388, 438, 462, 474, 610, 658, 691, 709, 734
- Baths, 630, 683
- Batti-Wallahs', 30, 100, 151, 179, 227, 445
- Berlin Distribution System 513
- Birmingham and District Club, 719
- Blackburn Elec. Works, 61
- Blackpool Elec. Works, 246
- Boilers [JACKSON], 631
- Boiler Tubes (Cowper-Coles), 534
- Bombay Mills (Westinghouse), 260, 286
- Boycott, Prague, 52, 116, 172
- Bradford Elec. Works, 443
- Brick Works (Westinghouse), 174
- British Assoc., 156, 296, 390; (Birmingham Meeting), 523
- British Electrical and Allied Manufacturers' Assoc., 60, 258, 322, 727
- British Westinghouse Club, 98
- Bulkhead Glands (Metal Jointing Co.), 308
- Cable Casings (Jennings), 669, 689, 708
- Cable Explosions Committee, 684
- Cables (B.A.Co.), 68; Damage, 602; (Henley), 407, 656; (Macintosh Works), 598; Paris, 168; Prices, 284; (Siemens), 653
- Calcutta, Elec. Supply, 661
- Callender's Hospital and Distress Fund, 64
- Canada, Trade with, 416
- Canvassers, 173
- Chester Water Power, 579, 734
- Chicago Street Lighting, 479
- China, Trade with (G.E.C.), 343
- Chingford Reservoir Pumping, 343
- Cinematograph: Regulations, 345; Targets, 284
- Circuit-Breakers (Igranic), 688; (Switchgear and Cowans), 640
- City of London, Engineer's Report, 452
- Clocks, Synchronic, 641
- Coal Sampler (Sturtevant), 459
- Coal Specification, 263
- "Cold Light," 262; [WALKER], 271
- Comb (Simplex), 708
- Companies Struck off Register, 124, 268, 510, 624, 724, 734
- Competition, 700; (Lundberg), 404, 438, 459, 624
- Concrete, Preserving, 52
- Condensing Plant, [DEXTER], 62; Leeds, 229
- Conduits and Accessories (G.E.C.), 658; (Simplex), 118, 444; (Smith & Davis), 504
- Conduit Wiring [TAYLOR], 118
- Construction Work, 171
- Cooking (*see also* Heating Irons, &c.), Brighton, 198, 639; (Dowsing), 561; (G.E.C.), 50; [MILNS], 594; [MORRIS], 523; (Simplex), 260, 273; ("Tricity"), 322; West Ham, 284
- Copper, 72, 190
- Corrosion Preventing (Cumberland), 362; (Cowper-Coles), 536
- Country House Installation, 477
- Cows, Milking, 529
- Defiance Pistol, 432, 450
- Defrauding Supply Co., 452
- Deptford Generating Station, 335
- Derby Corp. Bill, 247
- Development of Elec. Engng. [HOPKINSON], 581
- Dielectric Fatigue [HOLTUM], 408
- Diesel Engines [SANKEY], 203
- Dimmers (Adams), 204
- Drying [WALKER], 23
- Dundee, Laboratories, 584
- Earthing Neutrals [FEDDEN], 8; [PECK], 8
- Ebonite [PATERSON, RAYNER and KINNES], 173
- Eckstein, Heap & Co., New Works, 49
- Edison Battery Cars, 320, 377, 618, 677, 695
- Eggs Fried on Ice, 627
- Elec. Contractors Assoc., 362
- Elec. Trades Benevolent Inst., 11, 49, 105, 112, 151, 164, 228, 258, 324, 543, 599, 660, 714; [JUSTUS ECK], 390; [LUNDBERG], 364
- Elec. Trades Union, 610, 660
- Electric Automobiles [WATSON and MITCHELL], 377
- Electric Traction [KAPP], 523
- Electrical Co., 687
- Electro-Harmonic Soc., 30
- Electrostatic Power Measurement [PATERSON, RAYNER and KINNES], 257
- Engineers' Club, 626
- Engng. Standards' Committee, 388
- Evershed & Vignoles *v.* Paul, 578
- Exhibitions: Airdrie, 549; Anglo-American, 690; Barcelona 528, 726, 734; Building, 215; Cinematograph, 328; Commercial Vehicle, 431; Earl's Court, 365, 610; Gas, 568; Ghent, 321, 344, 423, 428, 550, 584, 598; Glasgow, 168, 216, 384, 603, 617, 642; I.M.E.A., 356; Ideal Home, 566, 581; Model Engng., 568, 578; Motor Car, 629; Motor Cycle, 684; Physical Soc., 617, 695, 715; San Francisco, 261, 407, 464, 727; Sheffield, 529, 609; Shipping and Machinery, 322, 528, 730; Southampton, 235; Supply to Olympia, 137.
- Exposure Tests of Metals [WILSON], 525
- Factories and Workshops' Report, 391
- Factory Regulations, 227, 464; Prosecutions under, 585
- Fans (G.E.C.), 164, 320, 345; (Wilson-Wolf), 262
- Faraday House O.S.A., 190, 599
- Feeders [CUNLIFFE], 10; [SAYERS], 117
- Finsbury Technical College O.S.A., 219, 238, 600, 683
- Fire-Alarms [MOORE], 420; (Siemens), 479
- Fire: Escapes, 88, 104; Extinguishers ("Clou"), 706; Risk, 93
- Fittings, Lighting (*see also* Conduits, Shades, &c.), (B.T.H.), 150, 291, 642, 731; (Benjamin), 554; (Simplex), 528; (Wardle), 118
- Flexible Wires (Siemens), 134
- Floating Power House, 416
- Flour Mills [CREAK], 602
- Forging and Stamping Plant [SPENCER], 694
- Fuel [BURSTALL], 523
- Fuses (G.E.C.), 22, 322; Kartret, 504; (Reyrolle), 64; (Siemens), 104; (Simplex), 606
- Gearing (Scholey), 671; (Silvertown), 654; (Terry), 708
- General Conditions, 476
- General Electric Co.'s Conversazione, 158
- Generators, Large, 210
- German Soc. of Illuminating Engineers, 11, 714
- Glare, 464
- Glasgow: Condensing Plant (Mirlees-Watson), 324 Police, 216
- Glass, Sealing Wires in [ANDERSON], 525
- Goods Clearing House, 431
- Greenwich Power House Equipment, 117, 254, 449, 515, 543, 672
- Grinders (Wilson-Wolf), 150; (Witton-Kramer), 594

# INDEX TO "ELECTRICAL ENGINEERING"

## GENERAL INDEX (continued).

- "Half-Watt" Lamps, 416, 567; (B.T.-H.), 487, 503; (G.E.C.), 512 [LANGMUIR and ORANGE], 646; [PROCTOR], 600; (Siemens), 477, 709, 721
- Hand Lamps, Defective, 663
- Heating (*see also* Cooking, Irons, &c.), (Bastian), 721 (B.E. Transformer), 62; (Belling), 331, 384; (Calor), 491; (Dowsing), 25, 561; (Edison & Swan), 514, 618; (Redglo), 653; (Simplex), 528; (Westinghouse), 640; (Wilkinson), 602
- Heating and Cooking: 407; [HILLS], 165; [ROLES], 189; [WILMSHURST], 161; Tariffs Conference, 10
- Holophane Co., 390
- Hornsey Elec. Works, 89
- Hunting of Alternators [EVEREST], 103
- Ice Plant (Westinghouse), 259
- Illumination, 10; [GASTER], 174; Decorations (Siemens), 654
- Illuminating Engng. Soc., 343
- Incorporated Municipal Elec. Assoc., 27, 44, 58, 182, 298, 520; Bill, 343; London Convention, 332, 351, 373; (Ann. Gen. Mtg.), 381; (Exhibition), 356; Elec. Vehicle Committee, 543, 694, 726; Standardising Plugs, 648
- Induction Motors [ALDOUS], 101; [DRIVER], 71; [NICHOLSON], 617; [SMITH], 727
- Inspection Lamps (Simplex), 262
- Inst. of Civil Engineers, 238, 592
- Inst. of Elec. Engineers: Ann. Dinner, 89; Ann. Mtg., 321; Ann. Report, 284; Building Fund, 645; Conversazione, 397; Council, 183, 202, 224; [Woonhouse], 224; Examinations, 203; Industrial Committee, 9; Journal, 158; Library, 60; (Lighting), 165; Local Sections (Calcutta), 123; (Manchester), 134, 236, 259; (Newcastle), 7, 275, 726; (Scottish), 52, 218, 286, 716; (Western), 72, 140, 573; (Yorkshire), 116, 291; New Members and Transfers, 32, 61, 110, 151, 214, 246, 320, 678, 696, 698; Paris Mtg., 203, 254, 286; (Report), 299, 484; Premiums, 276; Programme, 619; Research Committee, 684; Students' Sections, 48, 89, 162, 229, 233, 286, 345, 443, 694
- Inst. of Mech. Engineers, 210
- Inst. of Municipal Engineers, 662
- Instruments and Meters (Evershed and Vignoles), 276; (Record), 21; (Siemens), 720
- Insulation Resistance [EVERSHED], 663, 678
- Insulators, 546
- Internal Combustion Engines [Cox], 116
- International Congress of Consulting Engineers, 133
- International Electrotechnical Commission, 18, 71, 440, 512, 528, 554
- International Engineering Congress (San Francisco), 361, 407, 464, 727
- International Illumination Commission, 507
- Interpoles [ALLEN], 228
- Iron and Steel Institute, 207, 466
- Iron, Magnetic Qualities, 529
- Irons (G.E.C.), 28, 90, 134
- Italian Electrotechnical Assoc., 627
- "Job Line" Wire, 466, 569
- Johnson Billington Meters, 212
- Junior Inst. of Engineers, 272
- Kelvin Memorial, 383, 406
- Kingston Elec. Works, 552
- Lamp Lowering Gear (Lond. Elec. Firm), 11, 492, 670
- Lamp Switching (Lundberg), 50
- Lamps, Incandescent (*see also* "Half-Watt" Lamps, Lighting and Metal Filament Lamps) (B.T.-H.), 218, 392, 468, 576; (Cooper-Hewitt), 231; (Ediswan), 618, 642; (Osram), 222; (Stearns), 150, 183; (Sunbeam), 474; Bulb Obscuring (Siemens), 308; Daylight (Ediswan), 568; (Siemens), 466; Manufacture (Siemens), 164; Tests, 133, 298; Reduction in Prices, 536; 231; Metal Filament Lamp, 16, 121, 156, 231, 308, 390, 520, 604, 624, 627, 648, 669, 683, 688, 726; "Paragon" Transmission, 432; (U.S.A.), 38, 93, 133, 170, 487; Van Raden & Metz, 260
- Petrol Elec. Tract. [TIERNEY], 184
- Phase Advancing [KAPP], 239; [MILES WALKER], 31
- Phasing Out [HACKING], 32
- Platinum Alloy, 528
- "Point Fives," 62, 246, 312, 321, 357, 600; [SEABROOK], 262
- Poplar Elec. Works, 331
- Post Office: Power in [GUSTON], 714, 727; Tube, 121, 325, 367, 416, 434, 714
- Power Supply on the Rand [HADLEY], 159, 183, 272
- Pressure Rises (Brighton), 647; [DUDDELL], 647
- Prices for Power: Limerick, 369; [SIMPSON], 360
- Prime Movers [FERRANTI], 353, 382
- Printing Trade [PHILLIPS], 724
- Pumps and Blowers (Merryweather), 545, 618; (Roto-plunge), 72; (Silvertown), 606
- Railway Contracts, 480
- Reflectors (B.T.-H.), 246, 544; (Benjamin), 641; (G.E.C.), 529
- Remuneration [MARCHANT], 612
- Repairs, Defective, 628
- Research Laboratory, 432
- Restaurants, Elec.: American Opinion on, 32; "B. & K.," 255, 390; "Tricity House, 19
- Rjukan Railway, 440
- Rotary Converters, 190
- Royal Institution, 165, 700
- Royal Society of Arts, 401, 635
- Salford, Bulk Supply, 88, 100
- Salt Works (Westinghouse), 544
- San Francisco Congress, 361, 407, 464, 727
- Scaffold (Heathman), 64
- Sealing-wax Heaters (Simplex), 230
- Self-Synchronising Machines [ROSENBERG], 225
- Shades, Glass (B.T.-H.), 514
- Ship Cleaning (Torpedo Submarine Ship Cleaning Co.), 705
- Ship Propulsion [GRACIE], 692; [HIRD], 177; [MAVOR], 591; [REID and MAVOR], 420
- Ships, Elec. Equipment in, 365
- Showrooms: (B.T.-H.), 722; (Ediswan), 590, 724; (Sterling), 594
- Shop Window Lighting [AUSTIN], 465
- Signs (B.T.-H.), 641; (Ediswan-Zenith), 731; (G.E.C.), 275; (Simplex), 594; (Sun), 722; Regulations (L.C.C.), 606
- Smoke Abatement, 696
- Society of Engineers, 2, 64
- South American Enterprises, 364
- Southgate, Lighting, 113, 126
- Standardisation (B.E.A.M.A.), 285; [EVEREST], 726
- Stepney and the B.E.A.M.A., 263
- Sterilization, 276, 466
- Stoke-on-Trent Supply, 199
- Storage Batteries (Naylor), 526; Testing [EVANS], 285
- Stoves, Rly. Classification, 283
- Street Lighting, 525; (B.T.-H.), 134, 670; "Brighton" System (Siemens), 230; City of London, 20; Fittings (Siemens), 408; Manchester, 141, 162, 198, 203, 281; Marylebone, 660, 683, 694; Reflectors (B.T.-H.), 544; Southgate, 113, 126; Specification [TROTTER], 98, 202, 215, 259; Westminster, 109
- Strikes and Disputes: Aberdeen, 212; Brown, 167; Belfast, 95, 126; Dick, Kerr, 236; Evershed & Vignoles, 98, 138; L.C.C., 400; Leeds, 369, 692, 715, 727; Leicester, 270, 312; London, 486, 512, 696, 717; Manchester, 549, 609, 623, 635
- Stroboscope [ROBERTSON], 177
- Students' "Rag," 665, 684
- Suction Cleaner (Simplex), 504
- Supplies (Drake & Gorham), 669
- Notes Relating to (B.T.-H.), 72, 312, 468, 490, 706; (Ediswan), 604; (G.E.C.), 82, 170, 203, 260, 330, 392, 400, 407, 506, 520, 534, 595; (Pope), 536, 596, 610; (Siemens), 362, 462; (Westinghouse), 138
- Lampholders (Day), 22
- Law Suits, Pending, 207, 578
- Leadizing, 721
- Libel Action, 311
- Lift Controller (Adams), 295
- Lighting (*see also* Lamps, Incandescent) (B.T.-H.), 90, 104, 118, 190, 231, 254, 406, 418, 423, 433, 444, 584, 641, 654, 688; (E.E. & E.), 64, 640; (Ediswan), 593; (G.E.C.), 218, 293, 418, 570; [Dow and MACKINNEY], 662; Factory, 46, 322; Industrial, 504; Schools and Libraries, 440; [OGLEY], 628, 648; Shop Window [AUSTIN], 465; Temple, 729
- Lightning Arresters, 578
- Liquidations, 16, 96, 110, 222, 253, 282, 296, 312, 328, 388, 414, 450, 510, 610, 638, 657, 691, 709, 734
- Load Factors of Stations, 403
- Loans, L.C.C. Periods, 562
- Loetschberg and Simplon Traction, 569
- Lots Road Power House, 341
- Machine Tests [COOPER], 524
- Magnets: A.C. [WILSON], 164; Lifting (Witton-Kramer), 546, 656; Magnetising (G.E.C.), 407; Permanent [THOMPSON], 312; Susceptibility Meter [MURDOCH], 525
- Manchester Electro-Harmonic Soc., 60, 112, 168, 191
- Manchester: Lighting Battery [WHY-SALL], 59, 89; Street Lighting, 162, 281; [PEARCE and RATCLIFFE], 141, 162, 203
- Marylebone: Elec. Accounts, 15, 43; Extensions, 37, 151, 675
- Mercury Vapour Lamps, 545, 547; [ANDERSON], 525
- Metal Filament Lamps (*see also* Incandescent Lamps and Patents) [HANDCOCK], 23; [SIEMENS], 173; Effect on Eyes, 626; Influence of Globes on Life [SUNDEN], 498
- Metal Filaments, 219; [LEDERER], 648
- Meter Dispute, 128, 158
- Meters: Approved, 178, 198, 259, 401, 712; B.O.T. Regulations, 384; Specifications [HOLDEN], 626, 721
- Meters, &c. Control of [HANDCOCK, DYKES, and DUDDELL], 101

## PATENTS

- Arc Lamps:** Angold, 366; Boardman, 398; Crompton, 136, 386; Okun, 666; Quinn, 66; Rogers and Rowe, 326; Roubal, 508; Spencer and Johnson & Phillips, 718; (Electrodes), B.T.-H., 176, 252, 620; Herwig, 458
- Distributing Systems, Cables and Wires, Insulating Materials, &c.:** Ashton, 410; B.T.-H., 206, 232; B.T.-H. and Wedmore, 166, 176; B.T.-H., Garton, and Watson, 666; B.T.-H. and McCarthy-Jones, 682; B.T.-H., Taylor, Whittaker, and Spörborg, 42; Becker, 560; Bergmann, 166; Booth, 572; Brown, 620; Brown, Boveri, 608; Dreger, 606; Franz, 532; Leitner, 386; Olmstead, 650; Plohl, 346, 508; Soc du Temple, 636; Taylor, 136, 422; Waters, 366, 728; (Cables, Insulators, &c.), B.T.-H., 560; Beaver and Claremont, 686; Callender's Cable Co. and Pipkin, 248; Chubb, 481; Donders and Winterer, 366; Fellenberg, 206; Ford, 686; Frenkel, 398; Hepburn, 243; Kallmann, 42; Löwenthal, 494; Siemens, 106; Soc. des Forges et Acieries, 682; W.E., 310, 326; (Motor Control), B.T.-H., 532, 560, 616, 620; Eckmann, 366, 470; Krupp, 615; Peck and Eckmann, 75; Routin, 620; Siemens, 75, 326, 436, 616; (Vehicle Lighting), B.T.-H. and Garton, 94, 106; Berdon, 560; de Coster, 699; Foster and Pocklington, 152
- Dynamos, Motors, and Transformers:** A.E.G., 608; Ateliers de Constr. Elec., 560; B.T.-H., 152, 436, 481, 636; B.T.-H. and Whittaker, 728; Bergmann, 42; Brown, Boveri, 136, 176, 278, 686; Bullock, 532; Crompton and Burge, 572; Crompton, Macfarlane, and Burge, 232; Déri, 410; Dubilier, 458; Ellison, 636; Elec. Constr. and Pensabene, 446; Heyland, 152; Kettering, 220; Leitner, 494; Le Carbone, 422; Ljungström, 458; Mower and Hale, 292; Oerlikon, 192; Petersen, 136; Polkey, 326; Plaisant, 666; Price, 608, 620; Rolfe, 582; Rosenberg, 94, 278; Rouzet, 560; Ryder, 666; Scott, 292; Schlick, 26; Siemens, 80, 176, 366, 446, 582; Siemens and Howard, 398; Siemens and Taylor, 666; Shaw and Sharp, 206; Submersible Motors and Poynder, 310; Tattersall, 220; Vandervell and Midgley, 410; Vedovelli, Priestley, 636; Zabriskie, 12
- Electrometallurgy and Electrochemistry:** Ashcroft, 75; Deutsche Gold and Silber-Scheider, 559; Gibbs, 395; Guiterman, 572; Helbronner, von Recklinghausen and Henri, 248; Henderson, 582; Héroult, 456; Mackay, 26; Marino, 560; Michaud and Delasson, 456; Nodon, 456; Peacock, 166; Perreux-Lloyd, 682; Plauson and Tistschenko, 188; Steynis, 582; Stobie, 456; Tischenko, 132, 243; (Furnaces), Bally, 75, 188, 616; Bocuze, 132; Cie pour le Traitement des Métaux, 682; Cornthwaite, 132; Gomet, 132; Helfenstein, 243; Héroult, 502; Hiorth, 395; Holroyd, 682; Jössingfjord, 318; Morgan Crucible Co. and Spiers, 616; Patents Purchasing Co., 318; Rennerfelt, 132; Scott, 458; Simpson, 54; Soc des Nitrures, 75, 682; Stobie, 75; Testrup and Rigby, 75; Ubbelohde, 243; Wile, 26
- Heating and Cooking:** Albrecht, 560; Arpin, 728; B.T.-H., 686; Bally, 80, 94; Belling, 264, 518; Berry, 650, 686; Cooper, 152, 346; Digby, 560; Downe, 192; E. & O.A., Morrison and Davies, 310; Grundy, 458; Harrison, 456; Haskell, 470; Jung, 728; Kendrick, 206; Kercher, 548; Kirkwood, 292; Löfquist, 292; Mann, 106, 220, 548; Martin, 366; Michie and Paget, 718; Middlecoat, 470; Nash, 620; Nathan, 572; Perry, 166; Piper and Bridgewater, 518; Rives, 572, 596; Ruthenburg, 596; Schenberg, 122; Simplex Conduits and Taylor, 666; Simplex Conduits, Waterhouse and Birkett, 410; Slater's and Allensby, 166; Smith, 446; Townshend, 66; Unit Engng. and Brown, 728; Venner, 620; von Hentzel, 422; Weaving and Ferranti, 560
- Ignition:** Bauer and Eckmeier, 80; Brooks and Holt, 206, 422; Chapman, 494; Cook and Westwood, 398; Eisenmann, 494; Entz, 508; Heyl and Baker, 686; J.B.M. Co., 518; Keith, 80; Leitner, 136; Nehmer, 458; Scott, 546; Thompson, 220; Vandervell and Midgley, 503
- Incandescent Lamps:** A.E.G., 508, 532; B.T.-H., 136, 326, 410, 532, 560, 596, 699; Baum, 278; Bailey and Plews, 94; Beuttell and Manners-Smith, 136; Chemische Fabrik von Heyden, 666; Deutsche Gasglühlicht, 278; du Moulin, 156; Farkas, 136, 422; Fisher, 264; Gladitz, 386; Godin, 458; Hansen and Mohr, 310, 422; Harrison, 508; Herrmann, 470; Kast, 650; Leiser, 608; Ludecke and Brimsdown Lamp Works, 481; Lusted, 94; Naamloze Vennootschap Philip's, 686; Pakenham, 446; Pintsch, 386, 456, 446; Plechati, 728; Pope's Lamp Co., 620; Quain, 718; Schaller, 582; Schwarzkopf and Burgstaller, 572; Scouler and Dick, Kerr, 278; Sidon, 326; Stillman, 136; Truss, 446; Weisse, 26; Westinghouse, 26, 278, 292, 436, 532; Wolframlampen, 192, 572; (Vapour Lamps) B.T.-H., 458, 518; Bonissou and Guesnier, 94; Darmon and Leblanc, 546; Triquet, 346
- Instruments and Meters:** B.T.-H. and Holden, 620; B.T.-H. and Young, 398; Cooper, 470; Coplans, 532; Davis and Hunter, 422; Denny and Edgcombe, 220; Holden and Chamberlain & Hookham, 548; Irwin, 650; Schnippsier, 42
- Storage Batteries:** Cie Int. des Acc. Vedeka, 12; Fuller, 596; Galloway, 596; Niblett, 94; Porscke and Achenbach, 326; Sedneff, 582; Sokal, 456
- Switchgear, Fuses, and Fittings:** Abbatecola, 470; B.T.-H., 232, 292, 532, 666; B.T.-H. and Garton, 106; B.T.-H. and Young, 54; Berry, 366; Boutard, 582; Broadbent, 410; Brown, Boveri, 42; Byng and Taylor, 152; Clatworthy, 206; Coates and Reyrolle, 508; Cottier and Downes, 572; Edwards, 398; Elec. Conduits and Hemming, 470; Green, 572; Hancock, Dykes and Duddell, 508; Harriman and Reyrolle, 422; Hatfield, 220; Hunter and Shand, 346; Jackson, 650; Lee and Brame, 410; Lyhne, 106; Middleton, Baker, Farndon and Morris, 728; Moffett and Rosher, 232; Moller, 220, 582; Müller, 94; Nicholson, 346; Perl, 326; Pollak, 532; Roothan and Ferranti, 494; Sachsische Gruppenwechsel-schaft, 152; Siemens, 582; Siemens and Bolton, 532; Suter, 572; Thierry, 94; Tirrill, 518; Turner, 54; Vicars and Creffield, 94; Watson, 54; Wessel and Gysler, 80; Westinghouse, 518; Whyman, 66; Wyne, 292
- Telephony and Telegraphy:** B.T.-H., 220; Becker, 80, 310, 458; Brown, 166, 366, 620; Cossor and Stenning, 26; Degenhardt, 366; Gott, 176, 346; Gottschalk, 596; Heurtley, 398; Jensen, 508; Lagus, 481; Majorana, 518; Prance, 326; Raymond Barker, 248; Schiessler, 166; Signal Ges., 458; Siemens, 582, 650; Soc. des Téléphones, 80; Stille, 106, 481; Stern, 456; Western Elec., 278; (Wireless) Balsillie, 650; Brown, 636; Chambers, 220; Cie Radiotélégraphique, 422; Des Ordon, 718; Ditcham and Grindell-Matthews, 366; Drahtlose Telegr., 232, 326, 608; Dubilier, 310, 481; Galletti, 510; Girardeau, 386, 650; Goldschmidt, 510; Grahame-White and Fothergill, 548; Heinicke and Jasper, 42; Jamieson, 264; Lodge, 718; Majorana, 666; Marconi and Franklin, 66, 699; Marconi and Prince, 66; Marconi and Round, 42; Merton, 366; Moretti, 470; Muirhead, 42; Nat. W.T. and T., 80; Peake, 94; Plohl, 346, 508; Rottgardt, 248; Rouzet, 248; Sahaika, 326; Schow, 518; Shephard and McKechnie, 518; Sibley, 518; Signal Ges., 560; Torikata, Yokoyama and Kitamura, 192; Watkins, 532; Williams, 518; Zaharia and Rothlander, 326
- Traction:** Cross, 548; Dawson and Lucas, 106; Deschamps, 152; Gradenwitz, 481; Hartford, 650; Haworth and Thomas Transmission, 422; Holmes, 636; Leitner, 292; Marino, 66; Morrison, 596; Oerlikon, 80; Pieper, 106, 122, 136; Purvis and Gritman, 560; Siemens, Lydall, and Fairburn, 636; Thomas and Thomas Transmission, 470, 494; Throde, 54; Wulferding, 582; (Signalling) Duccellier and Guillon, 470; Firth and Leake, 494; Handcock, Dykes and Duddell, 596; Holliday, 206; Mimick, 122; Page, 94; Pearson, 518; Siemens and Lydall, 136; Stockdale, 446; Strachan and Henshaw, 264; von Kramer, 552; Ward, 608; Westinghouse and Brown, 12; Westinghouse and Peter, 12
- Miscellaneous:** Adam Hilger and Bellingham, 598; Allison and Lindsay, 686; B.T.-H., 42, 326, 398, 436, 699; Bates, Kelly and Corbin, 66; Beldiman, 206; Bennett and Fosbrooke, 26; Bruckwicki, 122; Bundgens, 508; Dawson and Buckham, 548; Dussaud, 598; Elders and Fettes, 494; Gaiffe, 176; Graham, 188, 456; Guasco, 183; Harris, 278; Helbronner, 80; Jack, 42; Johnson, 699; Krupp, 366; Lake, 470; Laycock and Hicks, 106; McNab, 552; Maccord, 192; Maurice and Byng, 456; Magnet-Werk, 481; Martin, 596; Morgan, 458; Otis, 656; Philip and Steele, 243; Schanzbach and Knapp, 548; Schuler, 481; Siemens & Halske, 481; Soc. Courtaud, 54; Tufiaoff and Domanewsky, 508; Turpin and Robinson, 666; Van Daalen and Schreiber, 264; Villiers, 718; Weber, 94; Weigert-Sterne, 66; Whitehead, 699; Willmott, 508; Wortmann, 560; (Mining), Cahuitwerke Nürnberg, 632; Close, 559; Fabrik Elek. Zunder, 502; Field, 318; Hoodley and Knight, 75, 395; Kahler and Junker, 502; Kessler and Berger, 188; Lamour, 318; London, 552; Nelson, 682; Schaffer, 682; Son, 243; Sterling Telephone, 132, 456; Thomson, 682; Watts, 188; (Safety Lamps), Dickie, 76; Farber, 615; Gordon and Wright, 559; Greanoff, 6; Hailwood, 456; Hanson Langston and E.P.S., 615; Heaton, 615; Hudson, 502; Hunte, 152; Joel, 188, 518; Joris, 559; Morrison, 6; Odham, 615; Paxton, 502; Sparkes, 76; Thompson and Rothwell, 456; Worsnop, 188; (Separators), Elektromagnetische, 75; Kraus and Oppen, 6; Krupp, 54, 66, 502; Maschinenbau-Anstalt Humboldt, 456; Nathorst, 682; Pollard and Emmott, 682; Ulrich, 75

## Expired Patents

- Arc Lamps:** Bremer, 422, 608
- Distributing Systems, Cables and Wires, Insulating Materials, &c.:** Albion Clay and Lawton, 572; Edmunds, 436; Stone, 264
- Dynamos, Motors, and Transformers:** de Kanda, 494; Highfield, 26; Hollick, 536; Inray, 192; Rowntree, 728
- Heating and Cooking:** Dowsing, 106
- Incandescent Lamps:** Conmentry-Four-chambault, 572, 603; Moore Elec., 650; Swan, 446
- Instruments and Meters:** Aron, 192, 596; Fraser and Elphinstone, 220
- Storage Batteries:** Junger, 206

**Switchgear, Fuses, and Fittings:** Aldridge, 586; Browne, 122; de Kandó, 494; Guett, 494; Holmes, 122  
**Telephony and Telegraphy:** Abolard, 176; Brown, 42, 508; Dearlove and Brown, 699; Frampton and Muirhead, 718; Higgins, 166; Kingsbury, 699; Muirhead, 26, 206; Pollak, Virag, Egger and Silberstein, 152; Siemens & Halske, 26; (Wireless), Braun, 54, 608; Marconi, 152, 176, 718  
**Traction:** Barreau, 386; Cantono, 410; Sprague, 192; Westinghouse, 122; (Signalling), Deakin and Roberts, 248; Ferreira, 12  
**Miscellaneous:** Dufton, 650; Heinrich, 176; Otto, 176; Rowntree, 608, 728; Sprague, Bowles and Hill, 636

## Amendments and Oppositions

**Arc Lamps:** Blondel, 718; Körting & Mathieson, 292; Siemens, 582

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** Rushmore, 560; Taylor, 446; Zickler and Czepek, 26  
**Dynamos, Motors, and Transformers:** Price, 728; Spinelli, 386; Vandervell and Midgley, 366  
**Electrometallurgy and Electrochemistry:** Du Bois, 596; Stobie, 106, 264  
**Ignition:** Bartschi, 596; Brooks and Holt, 582; Longford and Clark, 26, 42  
**Incandescent Lamps:** Abel, 264; B.T.H., 122; Fischer, 398; Hyde, 136; Leiser, 728; Pintsch, 481; Schwarzkopf and Burgstaller, 686; Westinghouse, 636; Wolfgram-Lampen, 686  
**Switchgear, Fuses, and Fittings:** Earl, 446, 608; Statler, 636; U.S. Lgt. & Htg., 54; Van Raden and Metz, 260; Wallwin, 278; Wilson and Caudolite, 192, 636  
**Telephony and Telegraphy:** Brown, 80; Dubilier, 470, 596; Graham and Rickets,

596; Jamieson, 398; Jensen, 458; Kingsbury, 310, 446; Leuch, 232, 410; Rouzet, 620; Steljes, 278  
**Traction:** Arnold, 122; Deschamps, 292; Oerlikon, 192, 432, 446; Struble, 718; Whitfield and Cowan, 718  
**Miscellaneous:** B.T.H., 608; Clarke and Chadburn's Teleg., 386, 398, 699, 718, 728; Davies, 636; Keppie and Maddick, 248, 718; Le Maître, 136, 166, 446, 494; McNab, 636; Richon, 248; Sperry, 481; Wills, 122, 248

## Restorations, &c.

**Switchgear, Fuses, and Fittings:** Hubbell, 166, 481  
**Telegraphy and Telephony (including Wireless):** Brown, 80; Poulsen, 232, 248, 404; Ritchie, 310, 436, 652, 666, 667  
**Traction:** Reid, 686  
**Miscellaneous:** Close, 650; Hawley and Jones, 608; Merrick, 608; Murday, 232, 458

## SUMMARY

OUR special section on "Electrical Engineering in the Mining and Metal Industries," which will be published on the first Thursday of each month, contains this week an interesting Paper on electric winding in the Rand mines by S. E. T. Ewing, information as to

some new safety regulations issued for the safe use of electricity in Belgian mines, a description of an important electric rolling-mill installation at the works of the Shelton Iron, Steel & Coal Co., an abstract of the belated Home Office report on the use of electricity in mines in 1911, particulars of patents relating to electricity in mines issued last month, and the rules for the conduct of examinations for mechanical and electrical engineers' certificates of competency under the South African Mines and Works Act. (Pp. 1-6.)

A PAPER by P. Bucher on electric welding, and the discussion on it at Manchester last month, brought out some useful and practical points both in the Paper itself and the discussion. (Page 7.)

MR. F. CREEDY'S Paper on the turbo-converter was further discussed at a recent meeting of the Scottish Local Section of the Institution of Electrical Engineers. (Page 8.)

A DIVERSITY of views on the subject of earthed v. unearthed neutrals on alternating-current systems was set forth in the discussion on Mr. Peck's Paper on this subject, which was read recently before the Newcastle Local Section of the Institution of Electrical Engineers. (Page 8.)

A LETTER from Mr. S. E. Fedden comments on the recent discussion on the earthing of neutrals, and describes the protective arrangements in use at Sheffield. (Page 8.)

WE publish further particulars as to the cause of the serious fire at the Salford electricity works reported in our last issue. It appears that the discharge from the battery considerably augmented the short-circuit current at the switchboard. (Page 9.)

WE publish further details of the function which will be performed by the I.E.E. Industrial Committee. The "Committee for the Protection of Electrical Interests" has been dissolved, its work having been taken over by the Industrial Committee. (Page 9.)

A PAPER by Messrs. J. G. and R. G. Cunliffe, read recently at the Manchester Local Section of the Institution of Electrical Engineers, went into the arrangement of feeders for heavily loaded tramway systems, recommending the extensive adoption of boosters. (Page 10.)

THE testing of Aron meters is dealt with in our "Questions and Answers" columns. (Page 11.)

A "HALF-LYRE" pattern of arc-lamp suspension with lowering gear, to diminish shadows, is described. (Page 11.)

A PATENT for lock and block signalling, taken out by L. de M. G. Ferreira and H. J. Pryce, expires during the current week after a life of fourteen years. Among the specifications published last week by the Patent Office are two for railway track signalling, one by the Westinghouse Brake Co. and H. G. Brown, and the other by the same Company and B. H. Peter.

The Compagnie Internationale des Accumulateurs Vedeka are protecting a high-capacity lead storage cell. (Page 12.)

COL. SIR H. A. YORKE, Chief Inspecting Officer of Railways to the Board of Trade, recommends all railway companies to adopt electricity for train lighting. Our "Traction Notes" also contain references to the question of guard-wires on tramways, a new type of storage-battery car on the New York Railways, and the accidents in the London Tube and District Railways this week. (Page 13.)

THE French Marconi Co. has obtained an important judgment against three French firms for infringement of patents. It is stated that these companies had supplied all the wireless installations to the French Government. (Page 13.)

HIGH candle-power metal filament lamps are displacing arc lamps for street lighting at Farnworth.—The credit balance for the June quarter on the Marylebone electricity undertaking shows a considerable reduction compared with last year.—Great satisfaction is being expressed with the flame arc lighting at Dundee.—Further particulars are given of the series lighting at Brighton. (Page 15.)

TWO large generating sets are required at Glasgow; further generating machinery, mains, &c., are required at Darlington, Bridlington, and at several places in South Africa. A 10,000-volt electric power scheme is to be constructed in Norway. Switchboards are required at Atherton; generating set at Ashford; and street lighting equipment at Islington. The Birmingham Electric Supply Committee have finally sanctioned the construction of a new power station at Saltley. (Page 15.)

"The Northampton Gazette."—The December number of the official publication of the Northampton Past Day-Students' Association has a larger number of pages than its predecessors, and gives, besides news of the doings of those connected with the Northampton Institute (Clerkenwell), articles on pulsatory direct currents and other matters, reviews of books, and various notes, which will be appreciated by those to whom it is addressed.

## ARRANGEMENTS FOR THE WEEK

SATURDAY, JANUARY 4TH.

*Association of Mining Electrical Engineers.*

5.30 p.m. Warwick and South Staffs Branch. Imperial Hotel, Birmingham. (1) "Speed Control of Three-phase Motors," by S. A. Simon. (2) "Underground Haulage Signals," by Mr. Beadsmore.

MONDAY, JANUARY 6TH.

*Institution of Electrical Engineers: Newcastle Students' Section.*

7.30 p.m. At Armstrong College. "Phasing out of Alternating-current Apparatus," by J. Hacking.

TUESDAY, JANUARY 7TH.

*Institution of Electrical Engineers: Manchester Students' Section.*

7.30 p.m. At Municipal School of Technology. "Automatic Circuit Breakers," by A. N. Howarth.

*Institution of Electrical Engineers: Glasgow Students' Section.*

8 p.m. At Royal Technical College, Glasgow. Discussion evening.

*Rugby Engineering Society.*

8 p.m. At Benn Buildings. "Large Steam Turbo Units," by J. P. Chittenden.

WEDNESDAY, JANUARY 8TH.

*Institution of Electrical Engineers: Birmingham Section.*

7.30 p.m. At University. "Parallel Operation of Alternators," by A. R. Everest.

THURSDAY, JANUARY 9TH.

*Institution of Electrical Engineers.*

8 p.m. "Design of Apparatus for Improving the Power Factor of Alternating-current Systems," by Prof. Miles Walker.

*Institution of Electrical Engineers: Dublin Section.*

8 p.m. At Royal College of Science. "Notes on Self-propelled Cars for Light Railway Work," by J. P. Tierney.

FRIDAY, JANUARY 10TH.

*Electro Harmonic Society.*

8 p.m. Smoking Concert, Holborn Restaurant.

**Society of Engineers Status Prize.**—The Council of the Society of Engineers will award in 1913 a premium of books or instruments to the value of ten guineas for an approved essay on "A scheme for the registration of Engineers, including particulars concerning the registration of Engineers in British Colonies and foreign countries." The competition is open to all, and detailed particulars may be obtained from the Secretary, 17 Victoria Street, Westminster. The last date for receiving essays is May 31st, 1913.

A HAPPY NEW YEAR.

## ELECTRICAL ENGINEERING IN THE MINING AND METAL INDUSTRIES

### ELECTRIC WINDING IN THE RAND MINES

A RECENT issue of the Transactions of the South African Institute of Electrical Engineers contains a paper relating to electric winding, by Mr. S. E. T. Ewing, who remarks that electric winding from deep shafts has come into very general use on the Rand during the past three years. He referred to an example from a shaft from which an average of 45,000 tons of rock were raised per month from a depth of 3,825 feet, in addition to men and equipment. This is equipped with two winders, one on the Ward-Leonard system, and the other a plain three-phase machine, both rated at 1,400 h.p. The efficiencies during winding time only have been shown to average 60.1 per cent. for the Ward-Leonard and 51.3 per cent. for the three-phase equipment. Regarding the total units per hour, at 12.5 trips per hour the consumption is the same; below this frequency the three-phase set has the advantage and above it the Ward-Leonard. At the normal winding frequency of 25 trips per hour the Ward-Leonard winder shows a saving of 80 units per hour. The winding costs for the shaft (including power, wages, repairs, maintenance, &c.) work out at 9.39d. per ton of rock hoisted (but not including interest or depreciation), of which 43 per cent. of the total is the cost of power. The author points out the difficulties in the conditions which prevent a reliable comparison being made with the cost of steam winding, but quotes a case where steam winding raised 816 foot-tons per one penny while 960 foot-tons were raised by electric winding.

The paper passed on to a consideration of safety devices, including those which provide against failure of power supply and those which render harmless mistakes on the part of the driver. The first class usually consists of a solenoid placed across the stator supply leads in the case of a three-phaser, or across the exciter bus bars in the case of a Ward-Leonard engine. Failure of supply releasing the core operates, through a trigger, a heavy weight, the fall of which simultaneously applies the brakes through a retarding arrangement, and either opens the supply switch for a three-phaser or opens the field circuit of the generator in a Ward-Leonard. An overload in the generator and winding motor armature circuit is usually arranged to operate the same device by means of a relay.

Considerable varieties of the second class exist, and they are generally worked from, or in conjunction with, the overwinding gear on the depth indicator. This may be of the dial form, or more often consist of two vertical screws rotated by chains driven from the drum shaft. The position of two nuts on these screws indicates the position of the cages in the shaft. In the limiting position the travelling nuts release a trigger, the power is cut off, and the brakes applied through the medium of a strong coiled spring or a heavy weight operating the safety device before-mentioned which takes care of failures of current. In another design two large cams are employed, one revolution or less of which corresponds to the full travel of the skip. The position of the control lever is limited by the shape of the profile of these cams, thereby limiting the acceleration at the beginning of the wind to a reasonable amount, and ensuring proper retardation at the end of the trip, together with release of the safety device and application of brakes in case of an overwind. Failure on the part of the driver to reduce speed when nearing the bank is taken care of in several ways. One very excellent device consists of a ball governor chain driven from the drum shaft which throws forward a catch to engage the upcoming nut on the depth indicator screw, which represents the rising cage. If the speed is high enough, the gear is tripped. Thus security is given that if the speed exceeds a definite limit at a pre-determined point below the shaft collar, the control is taken out of the driver's hands and the engine stopped. Further, the same centrifugal ball governor regulates, by means of a sliding sleeve, the position of the point at which the overwinding gear comes into action. That is to say, the higher the speed at which the bank is approached, the lower the point of automatic stoppage. In fact, electric control lends itself very readily to the applica-

tion of these and similar devices. Electric winders are as a rule fitted with more automatic safeguards than steam winders, and inherently these safeguards may be said to be simple and very reliable. The use of tail ropes with electric winders is very advantageous, and, as is well known, the trouble due to swaying in the shaft, which is a drawback to their use with steam engines, disappears with the perfectly even turning movement of the electric motor.

Experience so far goes to show that the liability of electric power supply to sudden failure introduces no element of risk into winding when properly designed appliances are used. The conditions of shaft sinking, however, call for special precautions against the possibility of stoppage during the time that elapses between the signal to start up and the drawing away of the bucket with the miners from the bottom. The provision of sufficient stored energy in a rotating flywheel to draw the bucket at least a few hundred feet away from the shaft bottom is the only method in use known to the writer. The flywheel may be an integral part of the motor generator in a Ward-Leonard engine, or be driven by a synchronous motor, which, on failure of the main supply, becomes a generator driven by the stored flywheel energy, and drives the winding motor in the case of a three-phase winder.

### BELGIAN ELECTRICAL MINING RULES

RECENTLY introduced regulations of the Ministry of Industry and Labour, published in the *Annales des Mines de Belgique*, and abstracted in the *Colliery Guardian*, forbid the use of electrical coal-cutters in fiery mines of "Class 3" in Belgium. In mines of less fiery nature, Classes 1 and 2, they are allowed under the following conditions:—Three-phase squirrel-cage motors only may be used, with voltage between phases not exceeding 250 volts. All motors are to be completely enclosed, and trailing cables, which are to have a minimum insulation resistance of 500 megohms, must be sheathed strongly and contain an earth conductor. The contacts connecting the trailing cables with the mains must be fitted with circuit-breakers, and arranged in such a way that they cannot be connected or disconnected until the current has been turned off. The circuit-breakers must be mounted in metal casings, filled with oil. The working of the cutting machines must be suspended directly if firedamp appears in any part of the working place. The taking of high-tension cables down intake airways for working coal-cutters through transformers is permitted, provided that the transformers are placed in well-ventilated fire-proof chambers, are oil immersed, contained in earthed metal cases, and provided with circuit-breakers on both the primary and secondary sides. There are also certain regulations regarding junction boxes and the cables connecting the transformers with the trailing cables. In another rule the direct and permanent earthing of the neutral point of star-connected three-phase installations is prohibited, except in case of lightning arresters and similar apparatus.

**South Wales Branch of the Association of Mining Electrical Engineers.**—At a recent meeting of the South Wales Branch of the Western Section of the Association at Swansea, it was decided to form a separate West Wales Branch, of which Mr. M. H. Clarke was elected Hon. Secretary. A Paper by Mr. L. Tukes on the parallel running of alternators was read at the same meeting.

**North of England Branch of the Association of Mining Electrical Engineers.**—The arrangements for the remainder of the session include a smoking concert during January, and the following meetings: January 15th (Paper by Mr. W. Baxter on "Induction Motor Details"), February 19th (Paper by Mr. R. Nelson [H.M. Electrical Inspector of Mines]), March 19th (Paper by Mr. F. Milburn), April 9th (Paper by Mr. W. J. Fisher), April 30th (Paper by Mr. C. P. Palmer on "The Installation of Gas-driven Ventilating Plant at Felling Colliery"). There will also be some visits to works. All communications should be addressed to the Hon. Secretary, Mr. Leslie Robson, Milburn House, Newcastle-on-Tyne.

## AN ELECTRICAL ROLLING MILL INSTALLATION

THE undertaking of the Shelton Iron, Steel & Coal Co., Ltd., of Stoke-on-Trent, is of considerable extent, and includes mines, collieries, coke ovens, blast furnaces, and rolling mills. The main works is situated at Etruria, and the auxiliary works includes a forge at Shelton. The whole works are being gradually converted to electric drive, and owing to the courtesy of the British Westinghouse Electric & Manufacturing Co. we are able to describe some of these developments.

The Shelton works contains a forge and four mills, which were until recently steam driven partly from boilers using waste heat. By substituting electric drive for two of the smaller mills and the auxiliary machinery, it was estimated that a considerable financial benefit would result. An economical source of power is available in the exhaust steam from the reversing rolling mill engines at Etruria. The whole of the exhaust steam from these and four small auxiliary engines is passed through a grease separator, and a 36 in. riveted steel pipe, to a heat accumulator constructed to the design of Mr. P. J. Mitchell. This is capable of supplying steam to the turbine when running at full load, for periods of one minute during cessation in the supply

sq. in. section, supported by creosoted timber ordinary poles, and steel terminal poles, and provided with a galvanised steel wire cradling. Multiple gap lightning arresters are provided at each end of the line.

The condenser is of the Leblanc surface type, with a cooling surface of 5,500 sq. ft. A "Conqueror" centrifugal pump, made by W. H. Allen, Son & Co. (Bedford), driven by a 72-B.H.P. Westinghouse motor at 600 r.p.m., circulates the condensing water, and passes off to a Zylba natural draught cooling tower. The dry vacuum pump is of the Leblanc rotary valveless type, and is driven by a 24-h.p. Westinghouse motor at 720 r.p.m. The pump motors are controlled by Westinghouse Admiralty type control pillars.

The motors installed at the Etruria works are of various types and sizes, and perform many arduous duties, including the driving of the feed rolls, skids, and raising gear appertaining to the 32-in. mill, the main engines of which supply the steam for the mixed-pressure turbine. Other motors are applied to the driving of saws, cranes, drills, shears, pumps, &c. It is unnecessary to particularise all these. Railway-type motors are employed for the feed rolls and in similar situations. The Bowling saw, by which the finished stock is cut off to the desired lengths, is now driven by a 55-h.p. motor, shown in Fig. 2, which replaces a steam engine.

FIG. 1.—1,000-kw. MIXED PRESSURE WESTINGHOUSE IMPULSE TURBINE, AND 3-PHASE 50-CYCLE, 5,500-VOLT ALTERNATOR.

of exhaust steam from the mill engines. Steam from the accumulator is also supplied to a Wright's heater-softener. Since the supply of exhaust steam is very erratic, it often happens that the full demand of the turbine and the capacity of the accumulator are exceeded, when much steam would blow to waste. This is prevented as much as possible by some of the surplus steam being utilised to heat the feed water.

In the power house is a 1,000-kw. mixed pressure Westinghouse impulse turbine, running at 3,000 r.p.m., and driving a three-phase 50-cycle, 5,500-volt pipe-ventilated alternator, with a direct connected exciter having a radial commutator. The set is clearly shown in the photograph reproduced in Fig. 1. The alternator is fitted with muslin air filters arranged so that one can be cleaned whilst the other remains in place. The generator supplies current to the 8-panel black enamelled slate switchboard, through a three-core paper-insulated double-armoured cable. The voltage is kept steady by a Tirrill regulator. The high-tension switchgear is contained in cubicles in the basement, and is mechanically operated from the switchboard in the turbine room. The various 500-volt D.C. motors in the Etruria works are supplied with current from the 610-kw. 5,500/500-550-volt transformer and a 500-kw. 750-r.p.m. 500-volt rotary converter, provided with an exciter and A.C. booster mounted on the same shaft.

The high-tension alternating current is transmitted to a substation at the Shelton works, and the transmission line is composed of bare stranded aluminium conductors of 0.2

Other motors drive a girder-straightening press, and a three-spindle girder drill, and a further application of electric drive is presented by a  $\frac{1}{4}$ -mile ropeway, by which dirt from the washing and screening house for the coal for the coking plant is conveyed away. The coke oven gas is used to advantage in a gas-engine-driven electric-power plant. The gas has to be well washed, and is forced through coolers, tar extractors, and purifiers by two Bryan Donkin rotary blowers, driven at 95 r.p.m. through double reduction gearing made by the Power Plant Co., by two 20-h.p. Westinghouse motors running at 600 r.p.m.

The latest addition to the hydraulic plant equipment is a Mather & Platt centrifugal pump driven by a 72-B.H.P. Westinghouse compound-wound motor, running at speeds from 600 and 1,000 r.p.m. The refuse from an old forge tip is discharged by tip waggons hauled by an endless cable receiving its motion from a 20-h.p. Westinghouse motor, driving through reduction gear to the drum outside the shed, around which the haulage cable is taken.

At the Shelton works a substation receives the incoming three-phase, 50-cycle, 5,500-volt lines from the power house. The feeder cables are taken to a 7-panel switchboard, from which connections are made through a 500-kw. step-down transformer to a 500-kw. 500-volt. compound-wound Westinghouse rotary-converter running at 750 r.p.m. This is provided with a liquid starter for starting up from the D.C. side. The rotor of this machine is so designed that the rotor of the power-house converter can be put in its

place in case of a breakdown. The machine is capable of a 25 per cent. overload for two hours, and usually runs from Monday mornings to Saturday afternoons without a stop. In the substation is also a 350-B.H.P., 500-volt, 450 to 720 r.p.m. compound-wound variable-speed D.C. motor, which drives the 10-in. mill. The motor shaft is provided with three bearings, and carries a 3-ft. 6-in. rope pulley for 12 1½-in. cotton ropes. A liquid starter placed outside the building is provided for the motor, and the speed is variable by a shunt field rheostat. The rope flywheel of the mill is 10 ft. 6 in. in diameter, and weighs 10 tons, the speed being 150 to 240 r.p.m. The mill has two three-high stands, and two stands of two-high rolls, and produces chiefly light stock and notched steel bars, such as are used in ferro-concrete work. The rope drive is completely closed off from the interior of the substation by steel plate guards, so that none of the fluffy matter from the cotton ropes can get into the windings. The power required to run the 10-in. mill light is 50 to 90 kilowatts. The motor driving the 12-in. mill is similar to the above machine, except that it is fitted

## EXAMINATIONS FOR MINING ELECTRICAL ENGINEERS' CERTIFICATES IN SOUTH AFRICA

THE rules for the conduct of examinations for mechanical and electrical engineers' certificates of competency under the South African Mines and Works Act, 1911, are printed in the Transactions of the South African Institute of Electrical Engineers. These examinations are held periodically, at Johannesburg or elsewhere, and application forms can be obtained from the Secretary to the Commission of Examiners, P.O. Box 1182 Johannesburg. Candidates must be over twenty-five years of age. A fee of £3 is required, a proof of good character and apprenticeship or equivalent experience. The examination is partly oral and partly in writing, and in the case of electrical engineers to take charge of machinery in mines embraces the following subjects:—Legal knowledge (certain portions of the Mines and Works Act and Regulations thereunder), strength of materials, power plant, driven machinery and mechanical appliances (including shop equipment and machine tools, lifting and conveying machinery,

FIG. 2.—HOT SAW DRIVEN BY 55-H.P. WESTINGHOUSE MOTOR; ALSO FINISHING ROLLS, FEED ROLLS, SKIDS, &C., OF 32-IN. MILL, ALL OF WHICH ARE MOTOR DRIVEN.

with a 36-in. pulley. This drives the crankshaft of the displaced engine by 12 ropes, the rope pulley on the engine crankshaft being 14 ft. 6 in. in diameter, and weighing 7 tons. The engine flywheel is left in place, and weighs 15 tons, all that is disconnected being the connecting rod big end and the eccentric strap. The engine shaft is driven at 90 to 150 r.p.m., and operates one stand of three high bolting rolls, and one stand of finishing rolls which may be worked either two or three high. The power required to run the 12-in. mill light is 45 to 80 kilowatts. The adoption of the rope drive keeps down the cost of the equipment, owing to the high speed of the motor, and the two motors can thus be interchangeable. There are a number of small Westinghouse motors scattered about the Shelton works, running on the 500-volt. D.C. circuit. These replace steam drives in the majority of cases in which they are supplied to such machines as saws, shears, hoists, and pumps.

The cost per unit of electricity generated, over a period of six months working, are as follows: Wages, 0.0331d.; stores, 0.0137d.; fuel, 0.0638d.; repairs, nil; total, 0.1106d. These figures are exclusive of interest on capital charges and depreciation. The cost for fuel is based on the average time which the turbine ran on live steam alone. The total number of units generated in this period was 2,080,000, so that the operating costs for the 1,000-kw. set may be taken at being approximately £1928.66 per annum.

pumping plant and mechanical power transmission), advanced electrotechnics (including practical electrical units, properties of conducting and insulating materials, generation of electricity, measurements and measuring instruments, primary and secondary batteries, transmission, transformation and distribution, application of electricity to power, lighting, signalling and other requirements), mining plant (including winding plant and ropes, production and use of compressed air, mine ventilation and metallurgical plant).

**A Prosecution under the Special Rules.**—An appeal was heard by the Lord Chief Justice and Lords Justices Coleridge and Rowlatt, on December 16th, against a decision of the Gateshead magistrates. The case before the magistrates was reported in ELECTRICAL ENGINEERING IN MINES, August 1st last, page XLV., and was brought by Mr. J. B. Atkinson (Inspector of Mines) against Mr. H. M. Imrie, Manager of Chopwell Colliery, who was charged with neglecting to earth a switch-box as required by the Rules. A man has received a fatal shock from the switch-cover. The magistrates had refused to convict, and the present appeal was brought by the Inspector. The case turns on the interpretation of the Rules, which are not enforceable as regards construction until 1920. The prosecution argue that earthing the switch is not construction, and does not come under this exemption; but the respondent holds that the earthing, which would entail running a new cable to the surface, is "construction," and cannot be enforced before 1920. Their lordships reserved judgment.

### ELECTRICITY IN MINES: HOME OFFICE REPORT

**PART II.** of the General Report on Mines and Quarries for 1911, by the Chief Inspector of Mines, which has only just been issued, includes a report by Mr. R. Nelson (H.M. Electrical Inspector of Mines). It is to be regretted that there should be so much delay in issuing these reports to the public.

Electricity was newly introduced into 46 mines during 1911, as compared with 40 in 1910. Scotland was responsible for 20 and South Wales for 13, while in the York and North Midland, and the Manchester and Ireland districts, there were no new installations. The particulars available show that the high-pressure A.C. system was introduced into five mines, the medium-pressure A.C. system into 11, the medium-pressure D.C. system into 13, and the low-pressure D.C. system into four. In the latter case, the current was used for lighting only.

**The Possible Use of Wireless Telegraphy.**—The report states that "the possibility of the application of wireless telegraphy to mines opens out an interesting field for speculation, and it is obvious that it might prove a valuable aid during rescue operations." In the most recent experiments between the surface and a depth of 800 ft., carried out by the Helsby Wireless Telegraph Co. and their representatives, Messrs. Sharman and Webb, there was not the slightest difficulty in hearing the Morse code at either end. The apparatus is to be further experimented with.

**Fatal Accidents.**—During the year 1911 there were 12 accidents, resulting in 12 deaths, directly attributable to the use of electricity in and about mines, whereas in 1910 there were 21 accidents, causing 21 deaths. Of the 12 fatal accidents in 1911, 11 were due to shock and one to an ignition of fire-damp in a motor room. It is thought that the last-mentioned was due to some temporary derangement of the ventilation (the leaving open of a door), causing an accumulation of gas in the motor room, which was near some old workings, and that this gas was ignited by the arcing at the surface of a liquid controller. Of the shock accidents, two took place on the surface and nine below ground. One of those on the surface was on a low and the other on a 500-volt lighting circuit, and in the latter case there is "no doubt that the deceased was either himself arranging a practical joke or that he had been the victim of one." All the underground accidents occurred on medium-pressure systems, two being on direct current. No less than six were caused by contact with outer coverings of apparatus live through the absence of, or an inefficient, earth

connection, and three were the result of defective insulation of the cable system. Since January 1st, 1905, electric shock below ground has been responsible for 62 recorded accidents and 64 deaths. The percentage of accidents due to electricity is small, however, for during 1911 the fatal accidents from electricity were only one per cent. of the fatal accidents due to all causes. Of the accidents on low-pressure three-phase systems, four were on completely insulated systems and four on systems with the neutral point earthed.

**Non-fatal Accidents.**—As in 1910, there were three fires reported to have been due to electricity. In one case Mr. Nelson thinks the most likely place of origin was at a trifurcating box for a three-core, lead-sheathed, paper-insulated cable. The ends of the cable were taped, but not sealed, and neither the lead sheath nor the armouring was earthed. In another case, the fire was due to a skimpily-designed fuse box, which was safe if the fuse blew under a gradually increasing current, but not on the dead short which had occurred. The accidents due to shock numbered 41. In one instance the injured man recovered consciousness after the Sylvester method of artificial respiration had been continued for over three-quarters of an hour.

**Electric Safety Lamps.**—The number in use is given as 4,298, against 2,055 in 1910. The lead was taken by Durham with 2,073, while none were in use in the Midland and Southern District. Electric ignition of safety lamps increased from 310,457 in 1910 to 343,112 in 1911, the total number of lamps in use being 723,934.

**Coal-cutters.**—The total number of machines in use in 1911 was 998 driven by electricity, compared with 873 in 1910, and 1,148 driven by compressed air, compared with 1,086 in 1910.

**Shot-firing.**—Out of a total of over 44 million shots fired, nearly 20 million were fired electrically.

**Prosecutions.** There were nine prosecutions of owners and four convictions for offences relating to the installation and use of electricity. Nine workmen were also prosecuted for contravention of rules as to electricity, and all were convicted.

Further particulars under the various heads have already appeared in our columns from time to time, and in particular in the issues of August 1st, 1912, p. XLVI., and September 5th, 1912, p. LVII.

### ELECTRICAL MINING PATENTS OF DECEMBER

**T**HERE were only two Specifications published by the Patent Office during December which are of particular interest to mining electrical engineers, and both deal with miners' safety lamps. The first is No. 27,085/11, by G. Greanoff. The light is produced in the lower part of the lamp by two or more incandescent lamps fitted to the base of the accumulator box and enclosed by a glass cylinder. The ends of this cylinder are made airtight by washers, and the whole is held together by means of a hollow bolt in the centre of the cylinder. Air can be pumped into this space through a non-return valve on the lower end of the hollow bolt. Between the upper end of the bolt and the under side of the accumulator box is a rubber diaphragm on which is mounted a metal disc. The air pressure causes this disc to bridge across two metallic points in the lamp accumulator circuit, so that when the pressure falls by fracture of the cylinder or otherwise, the circuit is instantly interrupted. One figure. No. 28,420/11, by D. Morrison, describes an accumulator and lamp set suitable for mounting in existing safety lamps in place of the gauze, lamp and oil container. The accumulator takes the place of the gauze and the flame in existing lamps. The circuit is controlled through a safety switch. Four figures.

**The Association of Mining Electrical Engineers, West of Scotland Branch.**—The monthly meeting of this branch was held on December 14th in the Royal Technical College, Glasgow. The chair was occupied by Mr. Matthew Brown, President. An interesting Paper was read by Mr. S. A. Simon on "Variable Speed A.C. Motors." The author explained that one of the chief arguments raised against the more extended use of three-phase alternating current had been the difficulty of obtaining efficient speed control of the motors. He did not believe in the universal adoption of three-phase alternating current, knowing that there are many applications of electrical power for which direct current is undeniably superior. The Paper was illustrated by lantern slides, and gave rise to a discussion which was taken part in by Messrs. R. H. Willis, George Stevenson, the President, and others.

## ELECTRIC RESISTANCE WELDING

**A** PAPER on electric welding by the resistance method, by Mr. P. Bucher, was read and discussed at a meeting of the Manchester Local Section of the Institution of Electrical Engineers on Dec. 17th. The author pointed out various disadvantages of welding methods in which the heat is applied externally, such as by the blacksmith's fire, the electric arc and oxygen blowpipes, including risks of overheating, and, in the latter cases, the glare produced. In the resistance method, the heat is generated within the pieces themselves, and, as the point of highest resistance is the joint, the maximum temperature is attained just where it is wanted. As to the source of current, special arrangements, such as motor-generators, have to be adopted where single-phase mains are not available. When current is taken direct from public mains, the sudden variations required by large welders are apt to give trouble, so that the adoption of a regulating choking coil is advisable to avoid sudden rushes.

The current supplied is transformed down to about 2 volts, and the transformer in almost every case forms part of the machine. The secondary winding takes the form of a copper casting corresponding to a single turn, and is fitted with suitable means for transmitting the current to the pieces which are to be welded. In the case of butt or end-to-end welding they generally take the form of clamps with jaws, which are either left plain, for job or miscellaneous work, or are fashioned to suit the section of the stuff for repetition work. These clamps are locked on the pieces either by hand or power devices. In the case of spot-welding the electrodes take the shape of truncated cones, and the current is only passed through a small circular spot—that is, only through a small percentage of the total area in contact. The method of working is in all cases the same. The pieces to be joined are gripped in the clamps or placed between the electrodes and brought into contact. The primary circuit is closed either by an independent act of the attendant or automatically by the machine. The heavy current flowing through the joint heats it up at once, and welding temperature is reached very rapidly. Simultaneously with the interruption of current and the cessation of the heating comes the upsetting or shutting of the weld by continuing or increasing the mechanical pressure which was first used to bring the two parts into contact. This pressure in butt-welding raises a lump or burr. Large pieces which retain the heat sufficiently long can be taken out of the clamps and swaged down under the hammer. Small pieces cool down too quickly to allow of this, and the burr is either ground or filed off. There are, however, machines with a swaging device built in. A similar effect is produced in spot-welding, and some of the metal is extruded between the two sheets joined, driving them slightly apart. This means that spot-welding cannot be relied upon to make a water- or gas-tight joint. If that type of joint is required, then the cone-shaped electrode of the spot-welder must be replaced by the roller of the seam-welder.

The main field of resistance welding is not so much jobbing, where arc and hot-flame welding reign supreme, but repetition work, where it scores immensely by virtue of its simplicity, accuracy, reliability, speed, and economy. For example, No. 3 S.W.G. chain links have been welded at the rate of ten to fifteen per minute or thirty to forty thousand per week, with a consumption of 737 kw.-hour per week. Again, spot-welders on miscellaneous hollow-ware can make about thirty-five thousand welds per machine per week, using 1 to 1.5 kw.-hours per thousand welds.

Results of tests at the National Physical Laboratory have shown an average tensile strength, expressed in percentage of the tensile strength of unwelded material, of 89.2 and 93.4 per electrically welded iron and steel respectively, against 89.3 and 81.6 for corresponding hand-welded material. It was also found that more uniform results were obtained by electric welding. High carbon steel can be welded up to about 0.8 per cent. carbon, but the results are not so satisfactory as in mild steel. When high carbon wire is welded the heat of the weld is a very short one, and the bulk of the adjoining cold metal seems to have a quenching effect on the steel, so that the wire when taken from the machine is glass-hard at the joint and easily snaps. To overcome this the wire must be locally annealed, and this treatment weakens the wire. The strength of a welded high carbon wire is about 60 to 70 per cent. of the unwelded wire. Pure copper can be butt-welded satisfactorily, and so can most of the brasses unless the percentage of zinc in them is too high, when the weld becomes brittle. Nickel and most of its alloys weld well; so do aluminium, silver, gold, platinum, and iridium. Only iron and mild steel lend themselves to spot-welding.

With brass and aluminium the process is not very reliable nor economical on account of the heavy current required.

## DISCUSSION.

Prof. E. W. MARCHANT (Liverpool University) gave some particulars of tests he had made to determine the amount of energy expended in making welds in iron wire, which he found to vary from 0.33 kw.-hours per 1,000 welds for 5/32 in. wire to 3 kw.-hours for 5/16 in. wire. He thought the explanation of the rapid increase of energy consumed for the larger wires was to be found principally in the cooling effect of the vice-jaws. He thought regulation by a choking coil had the disadvantage of increasing the energy required to make a given weld. On a large system the rush of current would not be seriously objectionable.

Mr. A. E. MCKENZIE (Manchester Electricity Department) related his experience with electrically-welded superheater tubes. Desiring to increase the degree of superheat, and finding the cost of fitting entirely new tubes prohibitive, it was decided to experiment in the way of welding lengths on. Twelve sample welds were made, six being simple butt joints, and six joints made by scarfing the end of one tube into the other. These welds were carefully tested, and it was found that while the simple butt joints were practically perfect and gave tests almost as good as the solid tube, the scarfed joints gave breaking tests only about half as good. Acting on results of these sample welds, the tubes in one superheater were altered, involving 80 butt welds, each of which was tested at 1,000 lb. Only about one joint was found defective and required to be remade. After this superheater had been in service six months, three more were similarly altered, and they have now all been giving very satisfactory service for about two years.

Mr. W. CRAMP (Municipal Technical School, Manchester) suggested that, as the pressure required was only about 2 volts continuous current, welding might be carried out by a cheap form of homopolar generator running at a moderate speed. He wished to know whether any difference had been found between the strength of welds made by direct and alternating currents, as he suspected that some electrochemical action might take place. The energy increase with the size of the work was accounted for partly by the larger heat capacity.

Mr. K. M. FAYE-HANSEN (British Westinghouse Co.) mentioned that some makers preferred to use laminated strips for the heavy current coils of the welders instead of the castings mentioned.

Mr. R. G. CUNLIFFE (Manchester Corporation Tramways) drew attention to the method of welding tramway rails, in which use is made of direct current obtained from a portable motor-generator set, driven off the trolley wires. Plates of metal were welded to the rails under considerable pressure by the passage of the current. The joints so made were expected to give a conductivity equal to the solid rail.

Mr. J. FRITH pointed out that in chain welders the short circuit through the link must have the effect of increasing the energy consumption. For direct current welding he considered that the Rosenberg constant current generator was an excellent machine.

Mr. W. POLLARD DIGBY (communicated) sent several very interesting slides showing the micro-structure characteristic of certain welds by different methods. Each weld showed under the microscope such structural features as to make it possible to say which method of welding was employed. He referred to the long splintered fracture given by welded steel bars, and stated that with all processes they showed a certain amount of oxydation. Welds made by the "resistance" method, and oxy-acetylene welds did not exhibit such, but all arc welds showed it, and often as magnetic oxide, which gave a peculiar needle-like structure when examined under the microscope.

Dr. ROSENBERG, who presided, also spoke, and the author replied briefly.

### Annual Dinner of the Newcastle Local Section of the Institution of Electrical Engineers.

About 120 were present at this dinner, which was held on December 20th, with Mr. W. C. Mountain in the chair. In the course of a speech proposing the toast of the Lord Mayor, the Sheriff and the Corporation of Newcastle, Mr. C. Faraday Proctor gave some particulars of the development of the local supply company and mentioned that at least eight new industries were projected in the district, as a result of the available cheap supply of power. Waste heat was also being utilised to a very large extent, and he understood that the Cleveland and Durham Co. obtained no less than 90 per cent. of their power from this source. Mr. R. Nelson (H.M. Electrical Inspector of Mines) proposed the Institution, and Mr. W. Duddell (President), in his reply, sketched out the sphere of action of the new Research Committee and the Nomenclature Committee. A combined toast of the various Local Institutions, &c., was proposed by Mr. C. S. Vesey Brown and suitably responded to. The toast of the Newcastle Local Section was proposed by Mr. Judd and replied to by Mr. Mountain, who referred among other matters to the pioneering days of electricity in mines, and to the possibilities of waste heat power production.

## THE TURBO-CONVERTER

At the Meeting of the Scottish Local Section of the Institution of Electrical Engineers on Tuesday, Dec. 10th, 1912, with Mr. Wm. McWhirter presiding, the paper by Mr. F. Creedy on "The Turbo-generator: A High-speed Direct-current Unit" was read and discussed. A report of the proceedings at Manchester, where the paper was first read, will be found in *ELECTRICAL ENGINEERING*, Dec. 26th, 1912, p. 719.

Prof. F. G. BAILY (Heriott Watt College) referred to the excessive cost of installation. It might be advisable in general practice, he thought, to increase the size of the ordinary machine and to sacrifice the facilities for the more perfect commutation. To a certain extent the application of Mr. Mavor's spinner idea defeated its object by all its influence being applied on the same line, thus endeavouring to increase the circumference and reduce the speed, besides the loss of a great deal of commutator velocity.

Mr. J. A. ROBERTSON (Burgh Electrical Engineer, Greenock) mentioned a 1,000-kw. direct-current turbo-generator with armature and carbon brushes, which has been running for two years without the brushes requiring renewal once during that time.

Mr. F. A. NEWINGTON (City Electrical Engineer, Edinburgh) thought that reliability and convenience should be attained by methods of regulating electrical gearing in preference to mechanical gearing, especially for large-size machines.

Mr. BUNTING (Bruce, Peebles & Co.) asked if the contrivance had yet been manufactured and used commercially.

Mr. W. L. SPENCE (Glasgow) foresaw difficulties in oiling the bearings of the machine. The spinner idea, which is found in nearly all gears, is very seldom thoroughly satisfactory. He mentioned its use on lift gearing, where good efficiency was obtained, but the gearing was not a permanent success. He referred to his success with machine-cut gearing which worked quietly at high speeds due to the perfection in cutting and lubrication.

Mr. SAM MAVOR (Mavor and Coulson) preferred the spinner form of gearing to the other. The experienced builders of large marine turbines on the Clyde which his firm had communicated with all mentioned that in their turbine practice they had overcome mechanical difficulties much greater than were met with in this design.

Mr. CREEDY, in reply, said that he found mechanical engineers generally less conservative than electrical engineers, who sometimes failed to admit the utility of a device with which mechanical engineers are familiar. While gearing itself might be less expensive than the induction generator, there was a saving on the converter which was cheaper than the generator.

## THE EARTHING OF NEUTRALS IN THREE-PHASE SYSTEMS

THE following are the points brought out in the discussion on Mr. J. S. Peck's paper on "Earthed & Unearthed Neutrals on Alternating Current Systems," read before the Newcastle Local Section of the Institution of Electrical Engineers on Monday, Dec. 9th, 1912. The paper and the discussions in Manchester and London were abstracted in *ELECTRICAL ENGINEERING*, Dec. 5th, 1912, p. 677, and Dec. 19th, 1912, p. 706.

Mr. W. C. MOUNTAIN (Chairman) suggested that the discussion should be confined to the main object of the Paper, which applied to power-station work. From a colliery point of view, he was convinced that it was a mistake to earth the neutral, and he strongly objected to the provision of automatic devices which would have the effect of plunging the whole pit into darkness in the event of an earth occurring anywhere on the system. He thought that the resulting pandemonium would be worse than the effect of an earth which could be rectified at the first convenient opportunity. He considered that a simple leakage indicator was the best thing to instal.

Mr. C. VERNIER (Newcastle-on-Tyne Electric Supply Co.) was in favour of earthing the neutral. Disturbances on telephone circuits were almost entirely due to electrostatic induction, and with one phase earthed the whole electrostatic balance of the system was upset. For very high voltages—say between 80 and 120 kilovolts, it might be worth while to cut down the insulation to earth, especially where corona effects were present to take charge of pressure rises.

Prof. W. M. THORNTON (Armstrong College) put forward the suggestion with regard to surges that the real oscillations which break down the insulation of a system had their origin in the flame of the arc between phases, by reason of its capacity. He suggested that a choking coil was an ideal medium through which to earth generator neutrals, but perhaps considerations of cost made this impracticable. He had tested many wave forms in different power stations, but he had never come across two machines which had exactly the same wave shape, and the wave of any one machine varied with the excitation.

Mr. P. V. HUNTER (Merz & McLellan) thought that the ability to run with an insulated neutral tended to slow repair work.

It was better to have faulty feeders located immediately by protective devices and repaired promptly. The suggestion to earth through a choke coil had the objection that the cost was excessive; the iron core of the coil had to be very large in order to avoid running at anything near saturation, as this introduced a peaky wave form which was very undesirable in a fault to earth. "Horn" spark gaps were liable to produce high-voltage oscillations.

Mr. F. O. HUNT suggested that choke coils in the neutral would be in series with the whole capacity of the system, and that this might give rise to resonance.

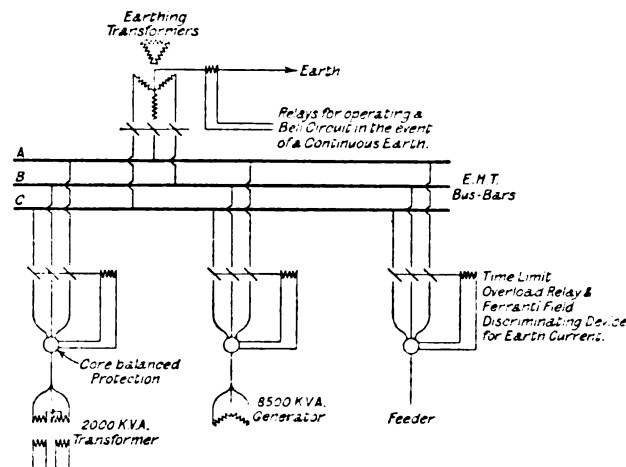

## CORRESPONDENCE

To the Editor of *ELECTRICAL ENGINEERING*.

SIR,—Mr. Peck's Paper upon earthed and unearthed neutrals on alternating-current systems has raised an interesting discussion. The majority of the speakers agree upon the question of earthing, but none of them appear to give reasons why the current should be limited or unlimited. The question of earthing, in Sheffield, had to be settled some eighteen months ago owing to the adoption of a three-phase supply, and I think the following information will be interesting to your readers.

The two- and three-phase systems are interconnected by Scott connected transformers, and the first point I had to decide was to provide an earth when the transformers were supplying three-phase current. The capacity of the transformers is 1,000 k.v.a. each, and at light loads they supplied three-phase current to several feeders. It was undesirable to earth the three-phase system through the neutral connections of the transformers, the chief reason being that, should an earth develop on any of the feeders, the overload relays on the transformers would operate, and thus cut off all the supply, including the earth connections without indicating the faulty feeder. Up to the present, earthing through a resistance on A.C. systems only follows a similar arrangement with a D.C. system at 500 volts.

The use of limiting devices now generally employed on E.H.T. three-phase systems causes an abnormal rise in pressure in

the neighbourhood of the fault. On the other hand, to allow 500 amperes to stray between the fault and the neutral point of the system is not beneficial either to gas, water and telephone companies' property or to the distribution system. It was therefore necessary to adopt some other method of overcoming these difficulties.

I give below the advantage of the arrangement that has been in use in Sheffield during the past eighteen months. The above diagram of connections is, I think, self-explanatory. The personal element of switching a working generator or transformer to earth is obviated. No expensive automatic selecting device is required. The earth current is limited to 51 amperes, which is sufficient current to trip the Ferranti-Field discriminating device. The earthing device was built by the British Electric Transformer Co., and is in the form of a transformer arranged with primary star connected and secondary delta connected. Having the secondary delta connected ensures that the neutral point on the primary is always at earth potential as proved by experiment. The earthing transformers are arranged to operate the trip coils of the respective switches in parallel with the overload and reverse relays. The units per hour taken by the earthing transformer are 1,250 watts. The capital cost is approximately £150.

Electric Supply Dept.,  
Sheffield, Dec. 21st, 1912.

Yours faithfully,  
S. E. FEDDEN,  
Manager.

## THE FIRE AT THE SALFORD ELECTRICITY WORKS

WE reported in our last issue the disastrous fire which caused serious interruption to the electrical supply at Salford, and was caused primarily by a spanner being dropped by a man working at the back of the traction switchboard and short-circuiting some of the connecting leads. The fire which actually resulted from this short was promptly extinguished by means of "Kyl-fyre" apparatus, and it was first thought the damage was slight. The traction-board runs down one side of the switchboard-room, the general board being on the other side. Between the two boards there is some iron grid work in the floor, down the centre of the room, and through this smoke and flames were observed to rise from the line room two or three minutes after the first fire was extinguished. This second fire grew rapidly and was the direct cause of the great damage done. Apparently the connecting cables between the two boards had caught fire as the result of the heavy short caused by the spanner, and in this way the whole switchboard-room became involved. The cables throughout were of "fire-resisting" type, consisting of a fireproof braiding over rubber insulation, and no doubt they would have withstood the heat had it been applied from without. As it was, however, it appears that the stranded conductors expanded outwards and burst the braiding, so exposing the rubber to the air, where, under the great heat from the conductors, it was set alight and burnt rapidly. No exact details are available as to the exact cause of the cables taking fire, but it would appear more likely that the bursting of them was caused by the severe mechanical stresses between neighbouring cables under the short-circuit, than that it was due simply to their expansion with the sudden application of heat.

It appears that the peak-load battery was on charge at the time, and that the whole time the fire was on it was discharging itself through the various shorts which developed and so fed the flames. The breakers cut out the machines and also a balancer set which was running at the far end of the station, so that the damage was confined to the switchboards.

Temporary connections have been made, and a supply is now being given as usual, but under considerable difficulty as regards the switching arrangements. New boards and connections will have to be installed, so that it will take some time before the damage is made good.

It has not yet been possible to obtain any definite official information as to the precise cause of the fire, but the above notes point to the most feasible explanation and accord with the sequence of events. In addition to the urgency for improvements in the lay-out and connection of switchboards, to which attention has already been drawn in our columns, two other lessons may be drawn from this accident: one, the necessity for definite interworking arrangements for power supply, and the other, that the safety tripping switchgear used with large accumulator batteries should be carefully examined and tested to see that it is capable of acting with absolute reliability on an emergency.

## THE I.E.E. INDUSTRIAL COMMITTEE

ON p. 650 of our issue of November 21st we reported that a formal announcement had been made of the appointment of an Industrial Committee of the Institution of Electrical Engineers, and we published a full list of the members nominated to it. We are now able to give more definitely the precise functions of this Committee, which were decided upon by the Council of the Institution as long ago as March 28th last, by the passing of the following resolutions:

(1) That an Industrial Committee be appointed by the Council to which there shall be referred, for consideration and report, all industrial matters coming before the Council, and whose business shall also be to report to the Council on any industrial matters which, in the opinion of the Committee, affect the electrical industry, and in respect of which the Institution might usefully take action.

(2) That the Committee consist of (a) 18 members drawn from the Members, Associate Members, and Associates of the Institution, at least six of whom shall be Members of the Council; (b) and, if so desired by the Council, other persons not exceeding six in number, connected with other organisations, and not necessarily members of the Institution.

(3) That the Chairman of the Committee be elected by the Council.

(4) That the Parliamentary Committee be merged into the Industrial Committee, and that the latter take over the work of the existing Parliamentary Committee.

(5) That, subject to the Council's approval on each occasion, the Committee arrange for special meetings of various branches of the electrical industry in the Institution building, at which

the chair shall be taken by a Chairman appointed by the Council.

(6) That the Council inform other bodies of the appointment and existence of the Committee and ask them to submit from time to time any matters which they consider should be taken up by the Institution.

Our readers will remember that some time ago, largely by the efforts of Mr. E. Garcke, a "Committee for the Protection of Electrical Interests" was formed, upon which were a number of leading men in the industry, and of which Mr. R. Borlase Matthews was appointed Honorary Secretary. The objects of this Committee were to deal with the more important commercial and industrial matters relating to the welfare of the industry, owing to the feeling which then existed that the Institution of Electrical Engineers was unable to deal with this aspect. Subsequently a suggestion was once more made to the Institution of Electrical Engineers that an industrial section or committee should be formed, and it will be seen that a number of the members of the older Committee have been nominated for the Industrial Committee of the Institution. The Committee for the Protection of Electrical Interests is now to be dissolved.

## CATALOGUES, PAMPHLETS, &c., RECEIVED

**STAGE PLUGS.**—A new design of ironclad waterproof 30-ampere stage plug is described in an illustrated leaflet from Tetley & Co. (Falcon Electrical Works, Salford). Among its special features are the screw boss for connecting up to the conduit. The plug is of metal, mica-insulated, and the current-carrying parts are mounted on fibre. The base is of porcelain, and the insulating brushes are screwed into the top.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**RESISTANCE MATERIALS.**—The latest list of ribbon resistance alloys from the Schniewindt Electric Co. (40 and 41 Staniforth Street, Birmingham), gives prices of a large number of sizes and qualities, stocks of which are held at the above address. The Schniewindt Co. inform us that they will be pleased to send the list to those of our readers who are interested, and to quote their lowest prices upon receipt of inquiries. Deliveries of all sizes of nickel-chrome heating wire at low prices can be made from stock.

## CALENDARS AND SOUVENIRS FOR 1913

We are very pleased to receive a neat, useful desk calendar from the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.). Each day is on a separate sheet, like an ordinary "tear-off" calendar, but the sheets can be turned over instead of being torn off, so that back dates can afterwards be consulted. Each sheet has space for memoranda, and as forward dates are also accessible by turning over the leaves, the block may be employed as an engagement book also.

A fine coloured view in Derbyshire is reproduced on the wall calendar for 1913 which we are very pleased to receive from the D.P. Battery Co., Ltd. (Bakewell, Derbyshire).

A strong and useful blotting pad has been sent us by the Hart Accumulator Co., Ltd. (Marshgate Lane, Stratford, E.).

Messrs. C. H. Blume, makers of insulating varnish, the White Building, Fitzalan Square, Sheffield, have sent us a very artistic hanging calendar, and also a neat memorandum book and diary of very convenient shape, made particularly thin for the pocket.

A pretty little pencil with a box of lead refills has been received from the Sun Electrical Co., Ltd., 118-120 Charing Cross Road, W.C. They tell us that they have sent one of these to all their friends, but if for any reason any of those sent have gone astray, they will be happy to forward another on application.

A neat morocco-bound pocket diary for 1913 is being presented to their friends by the Electric Construction Co., Wolverhampton.

Venner and Co. (6 Old Queen Street, Westminster), who always show originality at Christmas, have given us a Venner key-chain, which, to use their own words, "welcomes the coming and speeds the parting key."

The Armorduct Manufacturing Co., Ltd. (Farringdon Avenue, E.C.), have presented us with a bright blue office blotting-pad.

We have received a particularly pretty little table calendar decorated with a forget-me-not design from the St. Helen's Cable & Rubber Co., Ltd.

**Obituary.**—We regret to announce the death of Mr. Edward Tyer, one of the pioneers of the telegraph industry. His particular energies were devoted to improving railway telegraphs, and his method of electrically controlling railway signals is in extensive use all over the world.

The death has also taken place, at the early age of 46, of Mr. C. H. Gadsby, consulting electrical engineer.

## TRAMWAY FEEDERS

A PAPER by Messrs. J. G. and R. G. Cunliffe (Manchester Corporation Tramways Dept.), entitled "Some Problems in Traction Development—Tramway Feeding Networks," was read and discussed at a meeting of the Manchester Local Section of the Institution of Electrical Engineers on Dec. 3rd. The authors called attention to the increasing intensity of electric loading in kilowatts per mile in city tramways, and pointed out that the governing factor in feeder design is thus changed from overheating to pressure drop of an amount necessitating boosting. General arrangements of positive feeders were described, suitable to different conditions and degrees of loading. With light loading and few supply stations feeders may be supported by distributors, perhaps graded in size, but the simple feeding system without distributors is employed where there are several stations (as at Manchester and Liverpool). As the intensity of electrical loading increases, the length of the feeding section rapidly diminishes, and with very heavy loading, owing to the reluctance of engineers to employ feeders much larger than 1 sq. in. in cross-section, the simple feeder system of feeding is universally adopted, although, in many cases, with modifications, as at Chicago, where the feeder is continued throughout the whole length of the section and tapped on to the trolley wires at intervals of from three to six spans.

Little relief can be afforded long feeders by overcompounding, and likewise it is unsafe to operate a group of separate feeders from a common booster owing to the risk of abnormal pressure rise at the feed point of a temporarily lightly loaded section. For satisfactory operation a separate booster ought to be installed in each long and heavily loaded feeder. It is often advantageous to employ several short sub-feeders to each main feeder and to compensate the pressure drop in the main feeder alone by the booster.

With negative feeding it is impossible to divide the rails into definite feeding sections as is done in the case of the "line," and all negative feeders from any station must be operated in parallel, the difficulties encountered arising from the resulting lack of exact control of the load distribution in the rails. There can only be one point in the track on each side of the supply station at which there is no current flow. The balance point between the two sections thus formed can, for fixed loading conditions, be moved to some extent nearer to, or farther from, the station by increasing the resistance of the shorter negative feeders or by reducing that of the longer ones.

By the use of negative boosters the track may be divided into definite feeding sections almost as perfectly as is the line, and the flow of current in the rails may be controlled in a manner which is almost ideal, and the authors proceed to set forth their ideas of the correct principles of negative feeding. For a given rail drop the vagabond current should be proportional roughly to the square of the length of sub-section, so that it is of importance that such length should be a minimum. The ideal conditions attainable by the use of negative boosters are uniform absolute potential at the negative feed points, and hence no interchange of vagabond current, and minimum length of sub-section, and hence minimum vagabond current. The problem is—knowing the maximum and average intensities of loading at all points along the routes—to divide each route into negative feeding sections, each of such length that its own current flowing to its selected feed point shall split it up into two sub-sections having equal rail drop opposed in direction. The application of the negative booster is not likely to become sufficiently general to permit of the attainment of the ideal conditions, but the latter should be kept in mind. In the most general cases a booster is required either occasionally or continuously to operate a long negative feeder in parallel with shorter ones, and gives satisfaction provided the permissible maximum rail drop is not exceeded.

With regard to legislation, the authors hold that mere limitation of actual rail drop does not effect the desired object, but that there are two regulations in particular which would effectually prevent the use of the ideal system of negative boosting, viz., the British limit of 9 amperes per sq. in. in current density in the rails, and the present Chicago limit of steepness of potential gradient in the rails, which must not exceed 1 volt per 1,000 ft. in the down town sections and 1 volt per 700 ft. in other places. In conclusion, they say that legislation alone cannot provide complete protection against electrolysis. It must be assisted by careful construction. Metallic structures must not approach within 3 ft. of the rails (the German Commission recommends 1 metre), and in new construction or reconstruction care must be taken to

reduce to a minimum the number of poles which require to be bonded to the rails, as these pass down amongst the pipes beneath the footpath. Guard wires ought to be insulated from the poles and "earthed" by means of insulated cables passing down the interior of the poles to the rails, and poles carrying gas-lamps ought to have triple insulation rather than to be bonded to the track, as the latter is equivalent to bonding the pipes themselves to the track, which is bad practice.

### DISCUSSION.

Mr. B. WELBOURN (British Insulated & Helsby Cables, Ltd.) suggested that the expense in both positive and negative feeders would be much decreased by raising the pressure on the trolley wire, and that this would entail other advantages, including reduction in the number of substations necessary.

Mr. S. L. PEARCE (Chief Electrical Engineer, Manchester Corporation) said that the feeding problem was not of such vital importance in Manchester as in some other places, owing to the large number of substations. Again, boosting was not so necessary in mixed systems as in plain D.C. systems. With regard to the possibility of shifting the balance point between two sections, he thought that the effect of increasing the resistance of a short negative feeder and reducing that of a longer one would shift the balance point in the same direction. He did not think that extra copper should be put in parallel with the rails; it should rather be put into the feeders. The authors had set forth the advantages to be gained from the general use of negative boosters, and it seems that the strongest point for their use, apart from the ease of load distribution, was the fact that the pressure loss in the negative feeders was no longer subtracted from the negative section.

Mr. J. S. PECK (British Westinghouse Co.) spoke of the limited attention that had been paid to boosting in America, and suggested that a higher rail drop might be allowed by keeping all water pipes, &c., further from the rails.

Mr. H. A. RATCLIFFE (Manchester Electricity Department) pointed out some of the advantages of inserting resistance in short negative feeders.

Mr. E. M. HOLLINGSWORTH (Chief Electrical Engineer, St. Helens) had used negative boosting with success, and mentioned some trouble due to guard wires.

Mr. C. C. AITCHISON (Chief Electrical Engineer, Rochdale) spoke in favour of ammeters in the negative feeder circuits, and preferred separate feeders for a busy area to radiating sub-feeders.

Mr. A. G. COOPER (Chief Electrical Engineer, Colne) thought that the remedy lay rather with heavier rails than heavier feeders, as steel was relatively cheaper than copper.

Mr. R. ROWLANDS and Mr. C. G. L. PREECE also spoke, and Dr. E. ROSENBERG referred to the better efficiency of boosting over the resistance method. A communication was also read from Mr. H. E. YERBURY, and the authors replied briefly to some of the points raised.

**Conference on Heating and Cooking Tariffs.**—With reference to the note on page 725 of our last issue dealing with this matter, we are able to state that the scheme reported upon is an endeavour to arrange more or less level tariffs for heating and cooking purposes in the north-east corner of England. The electrical section of the Newcastle Chamber of Commerce took the matter up after the Newcastle Exhibition, and the towns concerned are Middlesbrough, Darlington, Stockton, West Hartlepool, and the supply authorities of Tees Side. These have been formed into two sections, north and south, who will discuss the matter from their own standpoints, and a combined meeting will then be held to arrange definite details. Up to the present not much progress has been made, but the movement is certainly one in the right direction.

**Pan-Russian Electrical Congress.**—The seventh Pan-Russian electrical conference is to be held in Moscow from January 8th to 18th.

**Illumination.**—An interesting Paper on the theory and practice of electrical illumination by Mr. J. G. A. Gerrits was read at a recent meeting of the Northampton Polytechnic Engineering Society. The author explained the relation between the units of candle-power, flux, and flux density, showed how the total watts necessary for the satisfactory illumination of a given room could be estimated, and dealt with the general functions of globes, reflectors, and shades.

**Lectures on Induction Motors.**—A special course of six advanced lectures dealing with induction motors will be given by Mr. J. K. Catterson Smith at the Finsbury Technical College (Leonard Street, City Road, E.C.) on Monday evenings, commencing January 27th. The syllabus covers both design and control, while demonstrations, testing, and experimental work, embracing the subjects dealt with in the lectures, will be arranged for in the laboratories. The fee for the course is 6s. Subsequent Monday evenings will extend the subject to other kinds of electric motors.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelopes.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,320.

A 3-phase, 500-volt, 50-cycle system of about 1,000 k.v.a. has a power factor of about 0.7, which it is desired to improve by installing a rotary condenser. Can any of your readers tell me the smallest possible size of synchronous motor which can be put in to bring the power factor of the whole system up to 0.9? I should also like to have a method of calculating this.

—Cos θ.

(Replies must be received not later than first post, Jan. 9th.)

### ANSWERS TO No. 1,318.

Describe the best and shortest method of testing Aron meters, and explain, if possible, why two meters of the Aron type, 2,000 amps, 550 volts, working on a traction load varying from 0 to 1,500 amps., show a difference between them when on the switchboard from 3 to 8 per cent. (from daily records), but when tested in the test room under constant load they are found to be correct to within  $1\frac{1}{2}$  per cent. It has also been found that when tested on 760 amps. constant load they both read 1.6 per cent. fast, whilst on 600 amps. both read slow. The meters when on the board were tried for stray fields, and found not to be affected.—N. P.

The first award (10s.) is made to CROMWELL for the reply given below in slightly abbreviated form:—

Aron meters reverse the current in the pressure winding periodically. As this would reverse the registration, the throw-over is arranged to insert an additional wheel in the registration gearing at the same time as it reverses the current; this causes the meter to continue to register in a forward direction. This is done to prevent the meter registering, due to a slightly incorrect adjustment of the pendulums, when no current is passing through the series coils of the meter and the pressure circuit is excited. Any forward registration over a period would, of course, be balanced by an equal backward registration during the following period—a "period" being the time taken from one reversal to the next. For this reason the tests must be taken over an even number of periods, otherwise any registration due to incorrect adjustment of the pendulum will be added to or subtracted from the units registered. Although over a sufficiently long period this would be negligible, it may cause a considerable percentage error when testing over a short period with a comparatively small number of units registered. The Aron Co. recommend a minimum registration of five revolutions of the first dial for any test. Most modern Aron meters have a period of ten minutes, i.e., the test must be taken over a period of twenty, or some multiple of twenty, minutes. It is not practicable to test these meters other than by the registering dials, so the shortest way is to run them at the various loads for the shortest even number of periods which will pass sufficient energy to give at least five revolutions of the first dial. Apart from these considerations, the same hints apply in the case of Aron clock meters as any other make of watt-hour meters.

With regard to the second part of the question, presumably the meters will be of the shunted type, and these meters have a fair temperature coefficient (about 0.15 per cent. per

degree F.); this may account for some of the difference if the meters are not working in the same temperature. Another possible source of error is the rapidly varying load. Reference to the behaviour of these meters on such a load will be found in Prof. D. Robertson's paper on electrical meters (*Journal of the I.E.E.*, Vol. 49, No. 215, p. 507), where he obtains some startling results, although, as he points out, the conditions are hardly likely to obtain in practice. A more probable source of error than either of these is to be found in the connections from the shunt to the meter, and the series circuit inside the meter. The series coils are wound on the pendulums in the shunted type, and this involves a number of connections; in the later types of meter these connections are soldered to avoid contact troubles. The full-load drop in the shunt is only about 0.2 volt, so a loose contact in any part of the shunted circuit is certain to cause serious errors. As the constant heating and cooling of parts may easily slacken some of the clamping screws it is advisable either to solder all connections in the shunted circuits or to tighten them all periodically. Another source of trouble is dirt getting between the commutator segments; this shunts a portion of the volt coil current and causes the meter to read low. It may easily be removed by a piece of sharpened peg-wood or a match stalk.

The second award (5s.) is made to M. M. who suggests substantially the same reasons.

## ANSWERS TO CORRESPONDENTS

J. W. MARTIN.—As you are over sixteen years of age and receive a weekly wage, you will come under the compulsory clause of the National Insurance Act. We are not aware of any approved society in connection with the electrical industry.

## ARC LAMP LOWERING GEAR

WE illustrate here an arc lamp carrier which is being put on the market by the London Electric Firm (George Street, Croydon). This is of the shadowless or "half-lyre" pattern and is designed to supersede at less cost the jibs and swan-necks, and old-time ladders and climbing irons, &c., for the lighting of railways, docks, harbours, quays, works, &c., &c. It is an adaptation of the firm's well-known patent "Lyre" shaped centre carrier and is adaptable for any size or kind of pole, wood, iron or concrete. It is provided with their automatic connector, and patent suspender; or, if a cheaper arrangement is desired, with their patent safety catch only, either plan ensuring that the weight of the lamp is positively taken by the carrier and not left on the hauling rope when in the burning position. In designing this new carrier attention has been paid to the desirability of obviating excessive swinging of the lamp in exposed positions during windy weather, and an efficient limiting device can be provided when necessary. The

winch used is of the firm's well-known patent self-sustaining type.

We are asked to state that the firm will send copies of their large catalogue of lamp-lowering and suspension equipment and self-sustaining winches for lamps, or other light weights, to any of our readers on request.

**Electrical Trades Benevolent Institution.**—This Institution will hold a Whist Drive at Slater's Restaurant, 50 Cannon Street, E.C., on Friday, January 17th, at 7 o'clock for 7.30. Tickets price 2s. 6d. each (inclusive of refreshment) may be obtained from Mr. C. H. Champion, of the Union Electric Co., Ltd., Park Street, Southwark, S.E.; Mr. B. E. Crowe, of the Sterling Telephone and Electric Co., Ltd., 200 Upper Thames Street, E.C.; Mr. A. J. Williams, of the General Electric Co., Ltd.; or from the Secretary, Mr. F. B. O. Hawes, 18 Park Mansions, Vauxhall Park, South Lambeth Road, S.W.

**New German Society of Illuminating Engineers.**—According to the *Elektrotechnische Zeitschrift*, it has been decided to found a Society of Illuminating Engineers in Berlin. A committee has been formed, and includes the following prominent members: Prof. E. Warburg, Chairman; Dr. Brodhun, of Berlin; Prof. H. Bunte, of Karlsruhe; Mr. G. Dettmar, Secretary of the Verband Deutscher Elektrotechniker; Prof. E. Hagen, Director of a Department of the Reichsanstalt; and Prof. Liebenthal, of Berlin. The first meeting of the new Society will be held next month.

## "ELECTRICAL ENGINEERING" PATENT RECORD

*(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)*

### Specifications Published Dec. 27, 1912

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications. Names in italics indicate communicators of inventions from abroad.

27,275/11. **Railway Signalling.** WESTINGHOUSE BRAKE CO., LTD., and H. G. BROWN. The signal indications are given by means of two or more lamps of different colours, or else they are arranged behind differently coloured screens or lenses. Alternating or pulsating current is used. The lamps giving the "danger" signal are permanently in circuit, with which is included one circuit of a controlling mechanism, another circuit of which is so inductively related to the first that the action of the latter, when energised, as regards permitting current to pass through the permanently connected indicating arrangements of the apparatus, is neutralised or otherwise rendered ineffective. Two figures.

27,276/11. **Railway Signalling.** WESTINGHOUSE BRAKE CO., LTD., and B. H. PETER. Current is supplied to a circuit constituted by the track rails, divided into block sections, a regulating resistance with a positive temperature coefficient being put in series with the source of supply or in series or parallel with a controlling relay connected across the track rails. As the signalling current is kept constant, a comparatively large decrease in the E.M.F. results between the track rails for a small decrease in the resistance between them due to the presence of a train in the block section. Moreover, an excessive current is not drawn from the current source when a block section is occupied.

29,318/11. **Storage Batteries.** W. CLARK (*Compagnie Internationale des Accumulateurs Vedeke*). Cells of high capacity and light weight are made by supporting the active material by a foraminous structure of insulating material provided with conducting wires for distributing the current throughout the mass of active material. Each electrode is enveloped in a pyroxylin porous sheath, foraminous separators being interposed between adjacent plates of opposite polarity. The whole assemblage of plates and separators is maintained under yielding pressure applied normal to the contiguous surfaces of the electrodes and separators. The construction of the active parts of the plates is described, and in order to increase the mechanical strength, nitrated cotton threads treated with acetone may be embedded in them, about 5 per cent. of caustic soda or potash is added, and a treatment with ammonia to get porous lead, yet of increased hardness, is applied. Five figures.

13,487/12. **A.C. Commutator Motor.** H. L. ZABRISKIE. A controller is arranged within the motor casing, and is actuated by a projecting handle. The motor is of the A.C. series commutating type. The field-magnet coils are each divided into main and auxiliary sections. The controller comprises a number of independent series of circularly arranged fixed contact studs, the corresponding studs of each series being bridged by a brush on an oscillatory controller arm. The auxiliary windings are connected to the contact studs so that corresponding sections are simultaneously thrown into and out of the field-magnet circuit. Arcing is prevented by putting the contact studs under the magnetic influence of the poles. The controller lever also actuates a spring-pressed brake lever, which acts on the driving pulley. Five figures.

### Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free. Summaries of some of the more important of these patents will appear in our next issue.

**Arc Lamps:** JANDUS ARC LAMP & ELECTRIC CO., and JONES [Means for transmitting rotary motion] 27,840/11; BURKITT, 4,417/12; LOW [Electrodes] 17,678/12.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** TAYLOR [Clearing faults on A.C. systems] 27,560/11; FODOR [Apparatus for connecting cables] 5,554/12; BULLERS, LTD., and TWISS [Insulators] 6,286/12.

**Dynamos and Motors:** SIEMENS BROS. DYNAMO WORKS, LTD. (*Siemens Schuckertwerke-Ges.*) [Speed regulation] 27,588/11; SCHLICK [Dynamos for vehicle lamps] 3,650/11; PODLESAN [Inductor alternator] 6,988/12.

**Electrometallurgy and Electrochemistry:** TESTRUP and RIGBY [Furnaces] 19,923/11; LOWY and MÜLLER [Non-porous deposits on metal sheets] 2,423/12; KNIPS [Sterilising water by ultra-violet light] 5,635/12.

**Ignition:** COWCHER, 29,326/11.

**Incandescent Lamps:** WEISSE [with bipartite bulbs] 8,058/12; WESTINGHOUSE METALLFADEN GLÜHLAMPENFABRIK GES. [Treatment of metals or alloys to render them ductile and malleable] 12,869/12; SMITH [Portable battery] 13,534/12.

**Instruments and Meters:** NORDFELDT [Prepayment attachments for current limiting] 27,801/11; SIEMENS BROS. & Co. (*Siemens & Halske Akt.-Ges.*) [Ohmmeters] 15,362/12.

**Switchgear, Fuses, and Fittings:** OLIVER [Automatic switch for lamps] 23,789/11; RANKIN and CHLORIDE ELECTRICAL STORAGE CO. [Regulating and equalising] 28,913/11; ANDERSON and FRITTS [Cable terminals] 13,111/12.

**Telephony and Telegraphy:** STELJES [Type-printing telegraphs] 20,106/11; [Typographic receivers] 20,107/11; NASH and WESTERN ELECTRIC CO. [Intercommunication telephones] 29,027/11; SCHNEIDER [Receiver for wireless] 18,086/12.

**Traction:** JONES [Indicating on vehicles their position on the route] 27,457/11; MALLOTT and MALLOTT [Safety gear for lifts, &c.] 5,611/12.

**Miscellaneous:** ARON and HARRISON [Clocks] 20,268/11; WILLS [Signalling or advertising] 21,734/11; PRIEST [Automatic fire-extinguishers] 27,163/11; LE MAITRE [Moving targets] 27,521/11; HOADLEY and KNIGHT [Mining] 28,388/11; A. C. COSSOR, LTD., and STENNING [Condenser] 6,987/12; BENNETT and FOSBROOKE [Signalling for screw-cutting lathes] 7,486/12; MOORE [Zinc for primary batteries] 8,767/12.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Arc Lamps:** KORTING & MATHIESEN AKT.-GES. [Solenoid coil for A.C.] 27,024/12.

**Dynamos and Motors:** CASE [Motor control] 27,837/12; Soc. S. T. A. R. (SYSTÈME DE TRACTION AUTO-REGULATEUR), 27,923/12.

**Ignition:** ROBERT BOSCH (FIRM OF) [Automatically adjusting time of] 24,665/12.

**Switchgear, &c.:** FUSS [Pressure regulators] 28,061/12.

**Telephony and Telegraphy:** BRUCE [Impulse transmitters] 24,409/12.

**Traction:** MIRAM [Electromagnetic crane] 27,922/12.

**Miscellaneous:** HENFELDT & KÜHNKE (FIRM OF) [Gyro-compasses] 27,739/12.

### Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

214 of Jan. 4th, 1899. **Lock and Block Signalling.** L. DE M. G. FERREIRA and H. J. PRYCE. The following elements are employed in combination with a block instrument (preferably that described in specification No. 5,867/95), using reverse currents and with a lever by means of which the mechanical signals are operated; a special lock for the commutator handle of the block instrument; a polarised relay, the armature of which controls a local circuit; a tappet sliding in guides and connected with the signal lever, so as to move with it, and having a catch which forms the armature of an electromagnet in the local circuit controlled by the polarised relay; a commutator worked by the signal lever and a lock magnet; a contact upon the permanent way designed so that as a train passes over it it will close an electric circuit in which the commutator lock magnet is included. No signal can be cancelled without the simultaneous concurrence of the signalmen in both sections. There are nine claims and 27 figures.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Arc Lamps:** SIEMENS BROS. DYNAMO WORKS and E. A. HOLMES [Turntable for searchlights] 20,201/07.

**Dynamos, Motors, and Transformers:** SIEMENS & HALSKE AKT.-GES. [Winding closed iron cores for transformers, &c.] 20,041/05.

**Electrometallurgy and Electrochemistry:** S. O. COWPER-COLES [To improve quality of electrically deposited copper, a little aluminium sulphate is added] 20,380/06.

**Incandescent Lamps:** A. LEDERER [Flashing process to indicate inequalities in cross section of squirted metallic filaments] 20,209/06; [Supports for metallic filaments] 20,210/06.

**Switchgear, Fuses, and Fittings:** J. A. J. HASLOP [Trueing-up or cleaning contacts] 20,460/07.

**Traction:** SIEMENS BROS. & Co. (*Siemens & Halske Akt.-Ges.*) [Electrically-controlled selecting signal rod or wire coupling] 20,312/06.

**Miscellaneous:** A. BLOCH [Burglar alarm] 20,456/06.

# ADAMS IGRANIC

Adams M<sup>rs</sup> C. L. Balfour House, Finsbury Pavement, London, E.C. Works-Bedford.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The fact that the wireless equipment of the P. & O. liner *Narrung* was able to remain in operation throughout the exceptionally boisterous weather experienced in the Bay of Biscay on Saturday last, speaks volumes for the solidity of the mechanical and electrical construction, especially that of the aerial. We understand that the equipment is the standard of 1½ kw. emergency set supplied by the Marconi Co. The aerial is of the standard twin type and is 200 ft. long supported between the two masts.

In answer to a question in the House of Commons on Monday, the Postmaster-General stated that the reduction in rank of Mr. J. E. Taylor from staff engineer to assistant superintending engineer has been accompanied by a reduction in salary from £540 per annum to £500 per annum with £20 yearly increments.

An important judgment has been delivered in Paris declaring that the Marconi patents have been infringed by La Société Française Radio-Electrique, La Compagnie Générale Radio-Télégraphique, and La Société des Transports Maritimes à Vapeur. It is stated in the daily papers that these three companies have supplied all the wireless installations to all the French Government Departments, and also the equipment of the Eiffel Tower. The Court has ordered an investigation of accounts and the confiscation of all infringing apparatus.

The Eastern Telegraph Co. are sending Continental telegrams for China, Japan and the Philippines "via Kiachta" to avoid possible delay.—Communication with Bihe is restored. The Indo-European Co. repaired their lines while the direct line between Saigon and Bangkok was down on Siamese territory for a short while.—The Teheran-Meshed line was down and repaired on the 23rd ult.—The French Cable Co. lost the use of the Cayenne-Salinas section on Dec. 21st, and the Mexican Government stated that lines were down to Huajuapaz, Villahuita, Chapam, Arteaza, Aguililla, Coalcan, Coahuacan, Zapotiltic, Tonila, Penoles, Coyaz, Palomas, Ascension, Ojitos, Guadalupezalco and to all offices in the States of Colima and Guerrero except Taxco, Izula, Mexcala, Tlaxo and Ometepe.—The Servian Government advised that these offices were open to International service:—Terisovitch, Guilane, Gostivar, Kossovska, Kratovo, Kitchevo, Kriva-Palanka (Evruj-Palanka), Moumanovo (Komanova), Mitrovitza, Novi-Bazar, Padoujevo, Prechevo, Priboj (Preboi), Priepalji, Prileo, Pristina, Prizren (Prisrend), Scaplje (Uskub), Sjenitza, Tetovo, Veles (Kouprulu), Vout, Hiren, Bitolj (Monastir). Telegrams for these places must be sent via Servia.—The Montenegrin Government also notifies the opening of an office at Saint Jean de Medova (S. Giovanni de Medova).—On Dec 23rd the direct Saigon-Bangkok line was down again, traffic being sent via Pakse.—On Dec 24th messages between Indo-China and Siam were subject to great delay. The Bonny-Duala cable was down on the same day and telegrams for Kamerun had to be sent from Bonny by each postal opportunity.—On Christmas Eve the Eastern repaired the broken cables between Madras and Penang.—The Bulgarian office notifies the opening of an office at Slatina.—The Teheran-Meshed line was down again on Dec. 25th.—The Italian Administration announced on Dec. 27th the opening of offices at Agila, Azizia, Garian, Taxluma,

Tussabat, Zavia and Zuara in Tripoli.—Owing to recent storms it is believed that there are five Atlantic cables being attended to or requiring attention, the sufferers being the Anglo, Western Union and Direct Cos.—The Commercial Cable Co. had a broken cable at Christmas, but it is now restored.—The Bermuda route was restored on the 30th ult.

## ELECTRIC TRACTION NOTES

By a curious coincidence there were two slight mishaps on the London Underground Electric Railways early on Monday morning last. The more important was at 7.30 a.m. at Down Street Station on the Great Northern and Piccadilly Tube, when, by some means, a resistance on an east-bound train earthed, causing considerable arcing. The short-circuiting gear (a bar which is let down over the rails) was applied, but failed to open the breakers in the substation, so that the arcing was kept up until the substation switched off. The west-bound track was not affected and the complete service was resumed within an hour. The other accident occurred to a District train near Wimbledon about 8.30 a.m. It appears to have been entirely mechanical. A part of the carriage frame known as the equalising bar broke and fell on the positive rail. The train proceeded to the station and the defect was remedied as soon as it was possible to get at it. No trains could run for about an hour on this section.

Lieut.-Col. H. A. Yorke, Chief Inspecting Officer of Railways to the Board of Trade, has been knighted.

A new type of storage battery car, with no separate compartment for the motorman, has been introduced by the New York Railways Company. The car floor just clears the axles and a 10 in. step from the street to the car floor is attained. The forty-four lead cells are carried under the seats. They give 29,000 watt-hours at the four-hour rate on normal charge. The car weight without the battery is 360 lb. per seat, or 485 lb. with battery, the total weight with battery being 16,500 lb. There are two motors rated at 85 volts 40 amperes.

In connection with the deputation which recently waited upon the Postmaster-General, protesting against the necessity for putting up guard wires on tramway routes, the Postmaster-General has informed the secretary of the Tramways and Light Railways Association that he hopes very shortly to be able to lay certain proposals before the Association.

A company with a capital of £210,000 has been registered for working tramways in the City of Sao Paulo.

Mr. C. H. Merz, on his way home to England from Australia, where he has been advising in connection with the electrification of the Melbourne railways, will pay a visit to India with a view to reporting upon the conversion to electric traction of some of the Bombay railways.

Once again the danger of using gas on railway trains has been demonstrated. Lieut.-Col. Yorke, Chief Inspecting Officer of the Board of Trade, in the report (just issued) upon the railway disaster on the L. & N. W. Railway at Ditton Junction on Sept. 17th last, calls special attention to the fact that the burning of the carriages was due to five vehicles being lighted by gas. The London & North Western Railway Co., however, it should be pointed out, is increasing yearly the number of its coaches lighted by electricity. Colonel Yorke points out that the chief point upon which opinions differ as to the use of electricity and gas on trains is that of cost, but as, on the one hand, some responsible railway officers consider gas is the cheaper, and others believe that electricity is cheaper, the difference in cost cannot amount to much either way. So far as safety is concerned, concludes Colonel Yorke, there can hardly exist in anyone's mind a doubt that electricity is the better, and railway companies would be wise to recognise this fact and adopt electricity as the standard illuminant on all their main-line trains before they are compelled to do so by the pressure of public opinion.

## LOCAL NOTES

**Bolton:** *Large Electric Power Contract.*—A contract is to be entered into with Messrs. Dobson and Barlow, the large textile mill manufacturers, for a supply of electricity upon special terms.

**Brighton:** *Series Lighting.*—The scheme of series lighting with which experiments are to be made in Brighton, as mentioned on page 725 of our last issue, is that in place of the old 7½ to 8 ampere open type arc lamps which are at present used in the lesser important main thoroughfares, 8 ampere metallic filament lamps of about 400 c.p. and 48 volts will be fixed, which can be run five in series on the existing wiring and under the present conditions off the 230-volt network.

**Devizes:** *Electric Supply.*—A London firm have asked permission of the Council to put down electricity generating plant with a view to supplying current to the town.

**Dundee:** *A Large Power Installation.*—The Council have successfully negotiated with a large mill for the installation of electric motors which, when completed, will add some 600 to 700 h.p. to the mains.

**Street Lighting.**—Great satisfaction has been expressed with the street lighting of Dundee since the new G.E.C. flame arc lamps were installed in September.

**Farnworth:** *Street Lighting.*—Mr. A. J. Hutchinson, the Borough Electrical Engineer, has been instructed to make a trial of high candle-power incandescent lamps for street lighting purposes. It has been decided to replace each of the forty-five 10-ampere Brockie-Pell arc lamps by two 300-c.p. Osram drawn-wire 220-volt lamps, which will be fixed on the same posts by means of a two-armed bracket, each arm projecting some 36 in. from the pole. The old lamps were 1,200 c.p., and were fixed 27 ft. 9 in. from the ground. The incandescent lamps, although fixed on the same posts, have been lowered to 20 ft. from the ground.

**Hamilton:** *Loss of Traction Supply.*—With reference to the decision of the Lanarkshire Tramways Co. to terminate their agreement with the Council for a supply of current for tramway purposes, the Manager of the Company states that a more advantageous contract is being entered into with the Clyde Valley Electric Power Co. In the discussion in the Hamilton Council (reported on page 713 of our issue for December 19th), it had been stated that the contract with the Clyde Valley Co. was to be at the same price as that now paid to the Council.

**London:** *Marylebone: Electricity Accounts.*—The accounts of the electricity undertaking for the June quarter show that the credit balance as compared with the corresponding period of last year is reduced by £2,539. The expenditure upon publicity work has increased in consequence of extensive development propaganda.

**Stoke-on-Trent:** *Supply in Wolstanton.*—In the recent sums for further capital expenditure on the undertaking sanctioned by the Corporation is £600 for extending mains to certain portions of Wolstanton under an agreement with that Council. At the last meeting of the Corporation an effort was made to have this decision rescinded, the argument in favour of it being that it was the first duty of the Corporation to do all they can to improve the supply in their own district. It was pointed out, however, that, so far as the portions of Wolstanton in question are concerned, the Corporation are bound to give a supply in consequence of the existence of the agreement already referred to, and the motion to refer the matter back was lost.

**Stroud:** *Electric Lighting.*—Messrs. Seymour Williams and Co. of London, have placed an electric lighting scheme before the Council.

**Swansea:** *Electricity Undertaking.*—At the annual inspection of the Corporation electricity works, Colonel Sinclair, Chairman of the Tramways and Electric Light Committee, reviewed the progress of the undertaking during its twelve years' existence. He called attention to the fact that the profits have increased from £700 in the first year to £3,600 last year, notwithstanding that the assessment has gone up to £800. The capital expenditure now amounts to £185,000, whilst the amount invested in sinking fund is £38,000. In addition, £10,000 has been placed to reserve from profits, and £1,000 have been contributed to the relief of rates from the same source. In conclusion, Mr. C. A. L. Prusmann, the Borough Electrical Engineer, was warmly praised for his work in bringing about such good results.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

## GENERATING STATIONS, SUB-STATIONS, MAINS, &amp;c.

**Ashford.**—A new generating set is recommended by the Borough Electrical Engineer, at an estimated cost of £5,260.

**Atherton.**—Extra high tension switchboard, also high tension switchboard. Resident Electrical Engineer. January 29th.

**Basingstoke.**—The Council have adopted an electric light scheme reported upon by Mr. F. R. Phipps, the Borough Engineer, and approved by Mr. J. B. Morgan, Electrical Engineer at Horsham. The estimated cost is £12,590, and Diesel engines are to be used.

**Birmingham.**—The Electric Supply Committee have now approved the scheme recently referred to in our columns for the construction of a new power station at Saltley, which will have an ultimate capacity of 100,000 kw. The first section of 25,000 kw. is expected to take four years to complete at an estimated cost of about £250,000.

**Bridlington.**—The Council have now decided to apply for powers to borrow £5,000 for a new generating set.

**Chile.**—Tenders are invited for a concession to erect a power station to distribute electrical energy in Valparaiso. Specifications may be seen at the Chilean Legation, 48 Grosvenor Square, W., and tenders will be opened at Chile on September 10th, 1913.

**Darlington.**—Mr. J. R. P. Lunn, the Borough Electrical Engineer, reports that the demand upon the generating station has almost reached the maximum capacity. He therefore recommends an expenditure of £10,790 upon additional plant, £8,000 for mains and services, and £1,500 for static transformers. The new plant will include a 1,000-kw. generating set with condensing plant and an additional boiler.

**Darwen.**—Further extensions to the generating station are contemplated.

**Glasgow.**—Mr. W. W. Lackie, the City Electrical Engineer, has reported that the maximum demand this winter has been 28,000 kw., which is also the maximum which the station can meet. It is therefore essential to order at once new generating plant, which will be installed in one of the existing power stations and removed later to the new works at Dalmarnock. He recommends the purchase of two of the largest generating sets commercially available, and, as will be seen from our advertisement columns, the Electricity Committee have acquiesced in Mr. Lackie's recommendations.

In connection with the new works at Dalmarnock and the general extension of the electricity undertaking, the Secretary for Scotland has sanctioned the borrowing by the Corporation of a further sum of £500,000.

**Kettlewell.**—A local company with a capital of £625 has been formed for the purpose of lighting this village by electricity. Mr. W. P. Inman, of Kettlewell, is the secretary.

**Lincoln.**—750-kw. turbo-alternator, surface condenser, rotary converter, switchboard, water-tube boiler, coal-handling plant, &c. (See an advertisement on another page.)

**Norway.**—Particulars are available at the Board of Trade Intelligence Dept., 73 Basinghall Street, E.C., of an electric power scheme in a Norwegian mining district. Transmission will be carried out at 10,000 volts by overhead wires.

**South Africa.**—An electric lighting scheme costing £6,000 is to be put in hand at Ladybrand.—The Harrismith Council propose to spend £14,500 upon a water-power electric lighting scheme.—The Cape Town Council require quantities of electrical accessories, including high tension cable.

## WIRING

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Brighton.**—Electric fire alarm and private telephone service for the Guardians. Consulting Electrical Engineer, P. Coote, Central Chambers, North Street Quadrant.

**Chorley.**—A new cotton mill to accommodate 700 looms. Architects, Buckley and Catterall, Bradford.

**Durham.**—Infectious diseases hospital at Easington.

**Greenock.**—Consumptive sanatorium. Town Clerk.

**Huddersfield.**—Weaving shed, Tenter Croft Mills. Architects, J. Berry and Sons, 3 Market Place.

**Leeds.**—The Holbeck Board of Guardians have decided to instal electricity at their institution.

**Sevenoaks.**—Swimming baths.

### MISCELLANEOUS

**Buenos Aires.**—A concession has been applied for for a service of trolley omnibuses.

**Harwich.**—Four motor-driven centrifugal pumps with switchgear, &c. Consulting Engineer, T. Mills, Manoria, Melksham, Wilts.

**London: Islington.**—An estimate of £1,326 has been passed for the electric lighting of Tufnell Park Road.

### TENDERS RECEIVED AND ACCEPTED

**Balderton.**—The tenders for public electric lighting have been handed over to a sub-committee for consideration and report.

**Greenock.**—A tender for a 5,000-kw. turbo-generator has been accepted at £13,500.

**London: L.C.C.**—It has been decided to fit all the L.C.C. tramcars with an improved type of Venner sign for numbering them, at a cost of £1,570.

**Rhondda.**—The Rhondda Tramways Co. have placed an order for the equipment of their tramways with Chamberlain and Hookham meters.

### APPOINTMENTS AND PERSONAL NOTES

At the Great Central Hotel, Leeds, on Saturday, there was a very enthusiastic gathering on the occasion of bidding farewell to Mr. Harold Dickinson, who is relinquishing his post as Chief Electrical Engineer to the Leeds Corporation in order to take up the position of City Electrical Engineer at Liverpool. As we pointed out at the time of Mr. Dickinson's appointment, he has been Manager of the Leeds undertaking since 1898, when the Yorkshire House-to-House Company's business passed into the hands of the Corporation, and was also Manager of the business under the Company prior to that date. There were some 300 present on Saturday, and Mr. Dickinson was presented with a pair of silver electric lamp standards and a silver cake basket. In returning thanks for the gifts, Mr. Dickinson indulged in a few reminiscences. He well remembered coming to the old Company twenty years ago when they had a small portable engine driving a 20-kw. dynamo supplying about twenty customers. The undertaking now had a capacity of 15,400 kw. and the new set on order would increase it to 22,940 kw. He also remembered well the trouble with the old rubber mains. As to the future, he is one of those who believe we are on the eve of tremendous electrical developments, and looks forward to the time when a privately owned power plant in Leeds will be a novelty.

The following is the final list of applicants for the post of Electrical Engineer and Tramways Engineer to the Bexley Council:—T. J. Kendrew, deputy borough electrical engineer and tramways engineer, Southport; J. C. Whiteley, assistant manager Chatham and District Light Railway Co., Chatham; A. A. Watkins, engineer and manager, Musselburgh; H. P. Stokes, borough electrical engineer and tramways manager, Ilkeston, and J. C. Williams, borough electrical engineer and deputy general manager of tramways, Rotherham. Mr. H. P. Stokes has been selected for the post.

A recommendation has been made that the salary of Mr. J. E. Starkie, Borough Electrical Engineer at Burnley, be increased from £400 to £500 per annum.

Mr. Travis, of Southport Electricity Works, has been appointed Chief Assistant Electrical Engineer at Hastings.

Mr. F. J. Delves, Constructional Superintendent for some time past of the Sales Department of the West Ham Corporation Electric Supply undertaking, has resigned to take up the position of Electrical Engineer to the United Malaysian Rubber Co., Ltd. Mr. Delves leaves for Singapore on January 8th.

Mr. Claude Crompton, Manager of the Lamp Shop of Messrs. Crompton and Co., Chelmsford, has severed his connection with the Company.

Mr. G. E. Piggott is now conducting, at 24 New Broad Street, E.C., the South Eastern Counties business of Messrs. Etchells, Congdon and Muir, Ltd., of Manchester.

Mr. W. Ogden Dayson, 1 Mount Street, Swansea, has been appointed the South Wales agent for the Electric and Ordnance Accessories Co., Ltd., in succession to Mr. C. R. Hough, who has given up the agency to start on his own account in the Midlands.

### MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith and Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £81 10s. to £82. (Last week the same.)

**Aubert Grenier and Co.**—The English business of this firm will in future be carried on as the General Cable Manufacturing Co. The address, 68A Lincoln's Inn Fields, E.C., remains the same, as do the telegraphic address and telephone number.

**Phoenix Dynamo Co.**—This firm announce their intention to double the capacity of their Thornbury works, Bradford.

**Plant for Sale.**—The Bristol Corporation have a quantity of plant for sale. (See an advertisement on another page.)

**Liquidations.**—The International Z Lamp Association, Ltd., is to be wound up voluntarily. Mr. C. Field, of Messrs. Franklin, Wyld and Co., Broad Street Avenue, is liquidator. A meeting of creditors will be held at the above address on January 6th, at 12 noon. Particulars of claims should be sent to the liquidator before January 31st.

**Bankruptcies.**—The last day for receiving proofs in the bankruptcy of A. E. Martin, trading as the Midland Electrical Supply Co., of 39 Great Charles Street, Birmingham, is January 8th. The trustee is A. S. Cully, 191 Corporation Street, Birmingham.

**Metal Filament Lamp Patents.**—On Friday, December 20th, 1912, Mr. Justice Warrington granted an interim injunction to Osram Lamp Works, Ltd., restraining Messrs. David Smith and Co. (Goblin lamps), their servants, agents, and workmen, from selling lamps infringing Osram Patents 23,899 of 1904, and 18,622 of 1906. The lamps in question had been supplied to Messrs. David Smith and Co. by the Dresdener Glühlampenfabrik. Writs for injunction have been served on a number of other lamp manufacturers and factors as well, and it appears that the Osram works are continuing their patent campaign with great vigour. The two patents in question are those which were certified by Mr. Justice Warrington as valid in the recent action against the "Z" Electric Lamp Manufacturing Co., which eventually ended in the "Z" Co. taking out a licence and joining the Tungsten Lamp Association.

**The Danger of Temporary Connections.**—The necessity of giving the utmost care and attention to temporary connections when alterations are in progress in the wiring of buildings was exemplified by a fire which took place at a large drapers, Messrs. Harvey, Nicholls and Co., Ltd., Knightsbridge, London, at 4.30 a.m. on Tuesday. Fortunately, owing to the promptness of the fire brigade, the damage was not so serious as it might have been, but it gave rise to grave anxiety, as there were about 200 workgirls sleeping in the building. Peculiarly enough, the alterations were being carried out for the purpose of improving the wiring system and rendering it more secure by replacing the old wiring in wood casing with special conduit wiring. During the change-over, however, a good deal of temporary wiring and several temporary fuse-boards were in use, and at one of the latter, behind which were a number of roughly-bunched cables, the fire probably originated, due to the blowing of a fuse. The board was fixed to a brick wall, in which a large hole had been made to accommodate an ironclad distributing-box immediately behind the board. A large stationery cabinet was just behind the board on the other side of this wall, and a lift-well was near by, so that the fire had ample opportunity to spread.

## SUMMARY

We describe the electric new restaurant, known as Tricity House, recently opened in London. The adaptability of electric cooking utensils for awkward places and the saving in space possible are well brought out. A detail described is the arrangement of an indicating lamp to show full and quarter heat. (Page 19.)

DETAILS are given (with illustrations) of the new electric street lighting which is now to be carried out in the City of London. Electricity is responsible for three times as much candle-power as gas. A new form of bracket is illustrated, and some particulars of the very substantial span wire construction adopted is given. (Page 20.)

A NEW moving-coil measuring instrument, in the construction of which there are several new and interesting details, is described. One feature is an extremely long evenly divided scale. (Page 21.)

We describe and illustrate a new lampholder designed for easy wiring, and a house service cut-out. (Page 22.)

A COMMUNICATED article deals with the question of drying by electricity. (Page 23.)

AN informal Paper by Mr. E. Handcock, discussed by the members of the Dublin Local Section of the Institution of Electrical Engineers, dealt with the relative benefit to the eyes of different systems of illumination. (Page 23.)

PETROL-ELECTRIC tramcars are to be experimented with at Oxford. At Folkestone the National Electric Construction Co. are proposing to adopt trolley omnibuses, or if the scheme is to be abandoned, powers are being sought to compel the Corporations of Folkestone, Sandgate, and Hythe to return certain sums of money paid by the Company. (Page 24.)

FURTHER evidence with regard to the Poulsen system has been heard by the House of Commons Committee, which is dealing with the Imperial Wireless scheme, there being complaints as to the way in which the British Government are alleged to have treated the Poulsen Co.—We also publish some information on the progress of the American Marconi Co. (Page 25.)

A PATENT by J. S. Highfield for the automatic reversible booster expires during the current week. Others expiring during the week include one dealing with details of a submarine telegraph relay by A. Muirhead, and a type-printing telegraph by Siemens & Halske. The specifications published by the Patent Office on Thursday last included one by the Westinghouse Metallfaden Glühlampenfabrik for the production of ductile tungsten for lamp filaments. Mr. W. P. Durnall's opposition to the grant of Patent No. 5,551/11 for the production of adjustable frequency, by K. Zickler and R. Czepek, has not been successful. (Page 26.)

An interesting but fortunately not serious mishap at Brighton calls attention to a necessary alteration in the ordinary methods of making the earthing connections of 3-phase generators.—The Belfast Corporation has been asked by some large power users to postpone the erection of a new power station.—The Nottingham Corporation is recommended to abandon the proposal to utilise some local water power for generating electricity.—The gas power at Accrington is being started up.—The County of London Electric Supply Co. are acquiring a large area of land in Essex for a new power station. (Page 27.)

THE large Birmingham power scheme is to be proceeded with. A 1,500-kw. turbo-alternator and two 500 motor-alternators are to be installed at Oldham.

A reciprocating engine set is to be installed at Maidstone; Diesel engines are required in New Zealand; £15,000 expenditure is contemplated at Ellesmere Port, £20,000 by the Stalybridge Joint Board, £13,000 at Stepney, and £8,000 at Bath. (Page 27.)

Mr. C. E. C. SHAWFIELD, Chief Electrical Engineer, Wolverhampton Corporation, and the President of the I.M.E.A., has resigned to join the Knowles Oxygen Company of Wolverhampton. (Page 28.)

We give particulars of the rearrangement of capital of Messrs. Willans & Robinson. (Page 28.)

## ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, JANUARY 9TH.

*Institution of Electrical Engineers.*

8 p.m. "Design of Apparatus for Improving the Power Factor of Alternating-current Systems," by Prof. Miles Walker.

*Institution of Electrical Engineers: Dublin Section.*

8 p.m. At Royal College of Science. "Notes on Self-propelled Cars for Light Railway Work," by J. P. Tierney.

FRIDAY, JANUARY 10TH.

*Electro Harmonic Society.*

8 p.m. Smoking Concert, Holborn Restaurant.

SATURDAY, JANUARY 11TH.

*Birmingham and District Electric Club.*

7 p.m. At Swan Hotel, New Street. Presidential Address.

MONDAY, JANUARY 13TH.

*Institution of Electrical Engineers: Western Section.*

4 p.m. At S. Wales Institute of Engineers, Park Place. Resumed discussion on Paper by T. Schontheil on "Overhead Transmission Lines." (An abstract of the Paper and first portion of the discussion was published in our issue for December 26th, 1912, p. 722.) Address on "Automatic Telephones," by W. Aitken.

*Institution of Post Office Electrical Engineers.*

5 p.m. At Institution of Electrical Engineers. "The Electrophone Service," by J. H. Pattman.

TUESDAY, JANUARY 14TH.

*Institution of Electrical Engineers: Manchester Section.*

7.30 p.m. At University. "Starting and Speed Control on Induction Motors," by F. C. Aldous.

*Association of Mining Electrical Engineers.*

7.30 p.m. North of England Branch. At Armstrong College, Newcastle-on-Tyne. "Induction Motor Details," by W. Baxter.

*Institution of Electrical Engineers: Scottish Section.*

8 p.m. At Glasgow University. "A Single-Phase Motor with Pole-Changing Windings," by J. S. Nicholson and B. P. Haigh. (An abstract of the Paper and the discussion in London appeared in our issue for December 19th, 1912, p. 705.)

WEDNESDAY, JANUARY 15TH.

*Institution of Electrical Engineers: Yorkshire Section.*

7.15 p.m. At Leeds University. "Comparative Notes on Independent Steam Condensing Plants," by W. A. Dexter.

*Institution of Electrical Engineers: Students' Section.*

7.45 p.m. At Victoria Embankment.

## The London Electrical Engineers.

MONDAY, JANUARY 13TH. A. Company.—Recruit Training, 7 to 10 p.m. Company Training, 7 to 10 p.m.

TUESDAY, JANUARY 14TH. B. Company.—Recruit Training, 7 to 10 p.m.; Company Training, 7 to 10 p.m.

**International Electrotechnical Commission.**—Meetings of the Special Committees on Symbols, Rating, and Prime Movers, in connection with Electrical Plant, will be held in Zürich from January 13th to 19th inclusive. We understand that the question of rating will be discussed. The co-operation of the British and Electrical Allied Manufacturers' Association has been of considerable value to the Joint Committee of the Engineering Standards Committee and the British Electrotechnical Committee, by whom the proposals made at the Paris meeting have been fully discussed in detail. It is also interesting to learn that Mr. A. R. Everest (British Thomson-Houston Co., Ltd, Rugby), representing the B.E.A.M.A., is to accompany Dr. Gisbert Kapp (who is the British delegate on the Rating Committee) to Zürich. Although not going as a delegate, Mr. Everest's intimate knowledge of manufacturing details, as well as difficulties, will be of much value to Dr. Kapp.

OVERHEARD AT "TRICITY" HOUSE RESTAURANT.

SHE:—I suppose they have to be very careful not to let too much electricity into the food, so as not to give one an electric shock.

HE:—I don't think there is any real danger; if proper precautions are taken, the electricity does not come into contact with the food at all.

SHE:—Oh! I thought it was the electricity that made it taste so nice.

## "TRICITY" HOUSE RESTAURANT

ON Tuesday we accepted an invitation of the British Electric Transformer Co. to inspect the recently opened electric restaurant at "Tricity" House (48 Oxford Street, London), and to partake of an electrically cooked luncheon. The restaurant, which is managed by a subsidiary company (Modern Electric Kitchens, Ltd.), is well arranged and the various rooms are tastefully decorated. Some of the simpler cooking operations are carried out in the room on the ground floor, enabling lunchers and diners to obtain an idea of the simplicity and convenience of electric cooking. Eggs are boiled, cakes are baked, and tea, coffee and toast are made in full view of the visitors. There are half-a-dozen hot-plates and a couple of "Tricity" ovens in this room.

Descending the stairs, one comes to a room in the basement of most irregular shape, and so demonstrating in a remarkable degree the flexibility of electric cooking as evidenced by the ingenious way in which cookers have been put into the odd corners and niches. There, also, are disposed the flour bins, china cupboard, and a pantry. On the first floor is a fine room, known as the "East" Room, decorated in Oriental style, with provision for light cooking as in the other cases. There is seating accommodation for about 150 persons in the three rooms.

The kitchen itself, where meat is baked, fish fried, vegetables cooked, &c., is situated right at the top of the building, and is only 15 ft. by 12 ft. in area. Into the middle of this has been put a square table, while round the walls are ovens, hotplates, grills, warming cupboards, and water-boilers, aggregating about 30 kw. The elements each take 800 watts and the standard "Tricity" extension cookers are used here as in the other parts of the restaurant. A feature is the extensive use of the duplex restaurant cooker, which is practically two ordinary ovens in one, with a sliding partition between and two doors, so that one large or two small ovens may be used at will. For the grill, standard grillers are used, with hanging cups to catch the fat, and ordinary elements, mounted in an inverted position on adjustable arms so that both sides of the viand may be cooked at once. All the apparatus is fitted with the Company's new indicating lamp.

As is well known, "Tricity" cookers are provided with a two-way switch, so that full or quarter heat may be obtained by putting the two elements (one at the top and one at the bottom of the ovens) in series or parallel. The ordinary indicating lamps can be arranged to show whether the element is in circuit

FIG. 1.—CONNECTION TO INDICATING LAMP.

FIG. 2.—CONTROL BOARD AND INDICATING LAMP.

or not, but at quarter heat the illumination is infinitesimal. To overcome this defect, the ingenious device shown in Fig. 1 has been invented by Mr. A. F. Berry. Fig. 2 shows its general arrangement, as mounted on the wall near the cooker. On closing the D.P. switch, current flows from the positive main via the fuse, and a suitably proportioned carbon pencil and

Eureka wire in parallel to the cooker and back to the negative main. The indicating lamp, which is mounted behind a red-glass bull's-eye, is connected across the ends of the carbon pencil as shown. The pressure drop across its ends is about 2.3 volts with full current. Owing to the fact that carbon has a negative temperature coefficient, while Eureka has practically no temperature coefficient, the resistance of the combination is appreciably more at quarter-load than at full load, so that the pressure drop is not then reduced to so much as a fourth, and the lamp will still glow faintly.

The electrical equipment of the restaurant comprises, in addition to the above, a complete induced ventilating plant, push-button service lift, vacuum cleaners, &c. The loads already connected are: lighting, 3.2 kw.; a sign (outside the restaurant), 1.6 kw.; radiators, 49 kw.; cookers, 54 kw.; lift, &c., 6.2 kw. The total is thus 124 kw. The wiring is on the three-wire system. The pressure is 480 volts D.C. between outers and 240 volts across lamps, cookers, &c., and current is supplied by the St. Marylebone Borough Council. The cooking at the Press luncheon to which we were invited was absolutely perfect.

## STREET LIGHTING IN THE CITY OF LONDON

THE City of London Electric Lighting Co., Ltd., are at last being authorised to extend the flame arc lighting in the streets of the City of London; a contract is about to be signed, and the work is on the point of commencement. It may be recalled that, in *ELECTRICAL ENGINEERING*, Dec. 22nd, 1910, p. 803, there appeared a complete description of the "experimental" lighting of the City streets by flame arcs, metal filament lamps and high-pressure gas, arranged by the Corporation to give the companies concerned a chance to show what they could do. As a result it was decided that the lighting of the streets should be divided between the electric lighting company and the gas company. The present contract allows for the continuance of the lighting schemes as adopted in the experimental sections and the replacement of the older existing electric lamps by the modern systems. In practically all places, however, where gas was the illuminant in 1910, it will remain, but we believe no further installations of centrally suspended high-pressure gas lamps will be carried out. Those erected in Cheap-side from Bow Lane to the Mansion House will be replaced by centrally suspended flame arcs, so that a continuous line of these will be formed from the Mansion House to Holborn, where flame arcs on central posts will take the place of the existing lamps.

When complete, there will be upwards of 400 arc lamps, by far the larger portion of these being of 2,000 c.p. (Oliver), while some will be of 3,000 c.p. (Oliver), and some of 4,000 c.p. (Excello). Over 300 of these will be centrally suspended, 27 ft. 6 in. high, about 40 on side-posts, and 20 on brackets. The handsome design of the latter is shown in Fig. 1, while the centre suspension or span-wire construction is well indicated in Fig. 2, which is reproduced from our issue of Dec. 22nd, 1910. One of the patterns of lamp-posts to be adopted (with an ingenious tilting lamp-carrier) was also illustrated in that issue; some improvements in detail have since been made, but

the rigidity of the construction is well brought out by the fact that no cases of failure have been reported.

The total candle-power of the electric lamps is nearly a million, most of which will be supplied by arcs. There will

FIG. 1.—SIDE BRACKET AND FLAME ARC.

only be about 120 metal filament lamps, varying in candle-power from 150 to 300. The total candle-power, gas and electric, is about one and a quarter millions.

(Continued on page 24.)

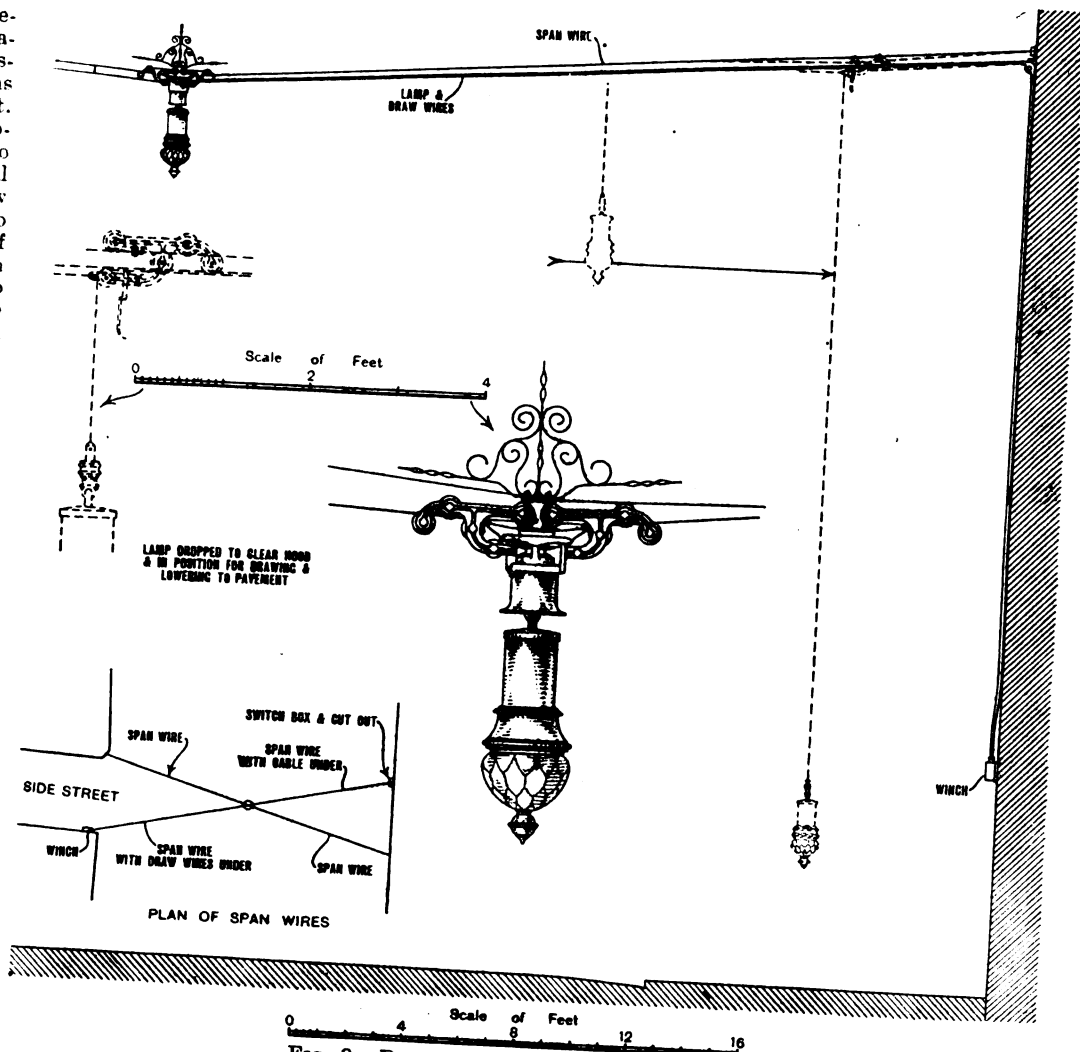

FIG. 2.—DETAILS OF SPAN WIRE CONSTRUCTION.

## A NEW MOVING COIL INSTRUMENT

**M**R. J. W. RECORD, of the Record Electrical Co., has devised an extremely ingenious method of extending the scale and range of a moving coil ammeter. In a new line of instruments, which his firm has now placed on the market, the length of the scale is  $300^\circ$ , and the instrument requires no more power than that consumed in the ordinary type, with which there is only a  $90^\circ$  deflection. The instrument can, in fact, be utilised with the ordinary shunts of standard resistance for the standard drop of 0.075 volt.

The arrangement which is adopted is seen in Figs. 1, 2 and 3. Fig. 1 shows the instrument with the cover removed.

FIG. 1.—INSTRUMENT WITH COVER REMOVED TO SHOW WORKING PARTS.

FIG. 2.—PERMANENT MAGNET AND POLE SHOES.

FIG. 3.—COIL AND NEEDLE.

Fig. 2 the permanent magnet, and Fig. 3 the coil and needle, whilst Fig. 4 is a front view of the instrument, showing the extremely long scale. Instead of the pole pieces being of the usual shape they take the form of flat annular discs. On the one pole there is a pair of discs and on the other pole a single one placed between these two and leaving just sufficient clearance for the coil to rotate in the small air

FIG. 4.—FRONT VIEW OF INSTRUMENT, SHOWING LONG SCALE.

space left. By this arrangement the coil is free to revolve almost through the entire circle. It will be seen, also, that the two air gaps are not in series, but in parallel, so that the addition of the second air gap actually reduces the magnetic reluctance.

In addition to giving a long scale, this construction has a further advantage of considerable importance also. The permanent magnet itself serves as the main frame for the working parts of the instrument and supports the lighter portions. Another mechanical advantage is that, owing to the disposition of the coil between the pole-pieces, it is impossible for it to foul the latter should there be any

## A VALUABLE WORK ON ELECTRICAL INSTALLATIONS.

By Rankin Kennedy, C.E.

If any reader who is interested in this subject will send the coupon below, he can obtain a complimentary copy of an illustrated booklet describing what is probably the most valuable work on the subject ever published.

The necessity for electrical engineers being well acquainted with all designs for installations that have given good results will be readily acknowledged by those whom the matter concerns.

While there are numerous text-books dealing with one branch or another of electrical engineering, they are all prepared for the student, and their contents deal rather with theory than with practice.

The aim of "ELECTRICAL INSTALLATIONS" is to assist the practical man who is concerned with electrical installations in any form, and this because it is recognised that there exists a very large class engaged in constructive and installation work, and a still larger class whose duty it is to take care of the machinery employed in working by electricity. Most of these men have picked up a working knowledge of their employment. What they need is to study the elements of the science of the subject. These elements are fully treated of in the first volume; and on the sound foundation thus laid, the author, who is a civil and electrical engineer by profession, and recognised as being in the front rank of electricians and engineers, proceeds to deal with every possible form of electrical installation, their principles and practical application.

This work describes and illustrates the best practice in all branches of the electric light and power installation business; the last volume treats of all the lighter branches of electrical manufactures—telephones, wireless telegraphy, and kindred subjects.

This second and revised edition of the work justly claims to have brought all subjects up to date with descriptions and information regarding recent machinery and apparatus. The matter has also been re-arranged so that all information relating to one subject follows consecutively.

The illustrations number 1,000, and there are eight fine plates in each volume. In addition, each plate contains a coloured cardboard sectional model of an electrical machine in four sections superposed.

### TWO OPINIONS:

**Mr. PONTECORVO, Engineer, The British Westinghouse Electric Co., Ltd., Manchester:**—"The work is very clear in its explanations, and gives, by means of well illustrated experiments, a complete idea of the electrical phenomenon. The chapter with hints as to how to build experimental apparatus seems particularly useful. Printing and illustrations are clear and accurate."

**Mr. A. H. SHAW, M.I.E.E., A.M.I.Mech.E., Manager Ilford Electricity Supply and Tramways, Ilford:**—"I consider this work is all you claim for it. The matter is clear and up-to-date, and the diagrams and plates are particularly good. The article on supply meters should prove very useful. This is a work that everyone engaged in the practical applications of electricity should have access to."

## A FREE BOOKLET.

To the CAXTON PUBLISHING Co., LTD.,  
97, Surrey Street, London, W.C.

Please send me, free of charge, and without any obligation on my part, Illustrated Booklet on ELECTRICAL INSTALLATIONS, and particulars of your plan whereby the volumes are delivered for a first payment of 1s. 6d., the balance being paid in small monthly instalments.

NAME.....

Send this Form or a Post Card.

ADDRESS.....

slackening of the jewels, a fault to which, it is said, some makes of moving coil instruments are subject.

Two sides of the coil are in the magnetic field, and these are at right angles to the axis of rotation, and the idle length of conductor is therefore exceptionally short, which results in the coil having a very low resistance. The resistance of the frame itself is low, and as the damping is produced by eddy currents in this frame, the instrument is very dead-beat. The scale is practically evenly divided throughout its entire length.

Another detail to which thought has evidently been given is in the marking of the scale. The pointer has a heavy blob, terminating in a fine point, and the figures are to the inside and not to the outside of the scale, and sufficiently far from the scale not to be hidden by the blob on the pointer. By this arrangement the figures can be very bold and are not hidden by the bezel when the instrument is viewed at an acute angle. At present ammeters and voltmeters are ready for the market in two sizes—8 in. diameter dials with scales 17 in. long, and 15 in. diameter dials with 3 ft. scale; laboratory sub-standard semi-portable instruments with 17 in. scales are also listed.

### A "ONE-PART" LAMPHOLDER

THE wiring of lampholders is always regarded as a "fiddling" job, and any innovation to render this simpler is to be welcomed. Messrs. G. St. John Day and Co. (Mumps Electrical Works, Oldham) have sent us a specimen of their new "one-part" lampholder, the wiring of which is particularly easy. The plungers, with their terminals, are simply pushed into the holder at the lamp end, and can be pulled out for wiring with a pair of pliers. Each

FIG. 1.—PLUNGER AND TERMINAL.

FIG. 2.—DITTO WIRED.

FIG. 3.—THE LAMPHOLDER.

wire of the flex is passed right through the holder through a hole in the top, and is screwed up in the terminal of the plunger, as seen in Figs. 1 and 2, and the plunger is then pushed back into the holder, keeping a slight strain on the wire to guide it. The top of the lampholder is of porcelain and is permanently secured to the barrel of the holder.

A simple plug adapter, in which the same principle is used, has also been sent us.

**An International Power Transmission Scheme.**—According to the *Basler Nachrichten*, an important transmission line is now under construction by the Swiss Beznau Electricity Works for the supply of power to the Ronchamp coal mines, near Belfort. The line is 84 miles long, and will transmit some 6,000 h.p. at a pressure of 70,000 volts, three-phase. The very long average span of 650 ft. will be employed, with steel towers weighing from 2 to 3 tons each, and suspension insulators according to the most recent American practice. It is a double-circuit line, and over 200 tons of copper will be required. Power will later be taken from the Olten-Gösigen station, now under construction. It is interesting to note that the line passes through territory of three countries, Switzerland, Germany (Alsace Lorraine), and France, *via* Anwil, Liestal, Münchenstein, Waldhohofen, Niedersept. and Belfort.

### A G.E.C. HOUSE SERVICE CUT-OUT

THE accompanying illustration shows the new pattern of house service cut-out, recently introduced by the G.E.C., Ltd. In the design and construction of this new cut-out, Home Office requirements have been strictly adhered to. The case is of cast iron, enclosing the fittings in a very neat manner. There is efficient insulation between the case and the fittings, and a

NEW G.E.C. SERVICE CUT-OUT.

liberal rating of metal parts. The contacts are sunk in a recessed porcelain block, thus rendering it impossible to make accidental contact with live parts when replacing the fuse holder. The fixing holes are drilled under the porcelain cable bushes. The capacity of this new pattern cut-out is 10 amperes. It is being placed upon the market at a very reasonable price.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelopes.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,321.

A private self-contained installation is required for supplying about fifty 16-c.p. lamps in a private house, in which possibly two or three radiators and other miscellaneous domestic appliances may be required later. The plant is to be placed in a shed or outhouse to be built near the house. The generating plant is to run only a few hours each evening, and cells are to take the intermittent demand. State, with reasons, what plant you consider the most suitable, whether petrol, oil, gas, or steam driven, the most suitable voltage to adopt, and give comparative estimates of cost. Details of wiring not required. Replies not to exceed 1,000 words in length.

(Replies must be received not later than first post, Jan. 16th.)

### ANSWERS TO No. 1,319.

No reply of sufficient merit for an award has been received

## DRYING BY ELECTRICITY

By Sydney F. Walker

IN ELECTRICAL ENGINEERING of Oct. 31st, 1912, a reply was given to a question, in which information had been asked upon the subject of drying by the aid of electricity. The drying operations in different industries are carried on almost entirely by means of air; and where the quantity of moisture to be removed is large, by air raised to a fairly high temperature. There are two methods open to the engineer who has to lay out a drying plant; he can first dry the air that he is going to use, and then heat it; or he can heat the air without previously drying it. The latter is the more common practice, but the former has the advantage that the drying operations are completely under the control of the engineer. If the air is not dried previously to heating, the drying operations are more or less subject to the vagaries of the atmosphere. The difference may be met by increasing the temperature of the air on damp days, but in some cases the higher temperatures may be objectionable, and in any case it is better to perform almost any drying process at as low a temperature as possible. Air varies very considerably with the temperature in its capacity for absorbing vapour. At 80° F., for instance, a cubic foot of air can only absorb two grains of moisture; while at 80° F. it can absorb 11 grains; at 100° F., 20; at 120° F., 35; and at 150° F., 70 grains. Where, as may frequently happen, the outside air is at a temperature of 80° F. and has a humidity of 90 per cent., the temperature to which the air passing through the drying apparatus must be raised is much higher than when it has been previously dried.

The process of drying the air, before it is heated, is very simple. It is merely caused to pass over a grid of pipes, through which brine, cooled by refrigerating apparatus, is circulating. The temperature of the air is lowered to 80° F. or thereabouts, and caused to deposit its moisture on the grid of brine pipes. When drying any substance by air there are two distinct operations to be performed; the water held by the substance to be dried has to be converted into vapour; and the air which is to cause the evaporation has to be raised to the temperature at which it will absorb the vapour. The heated air must also be caused to pass continually over the surface of the object to be dried.

Taking the figures given, 1,000 lb. of moisture per hour, and also taking the figure 1,000 B.Th. units as the latent heat of the vapour that is to be formed from the water held by the object to be dried, this means that 1,000,000 B.Th. units per hour have to be removed; and, taking 778 lb. foot per B.Th.U. as the mechanical equivalent of heat, the writer makes out that this would require 292 kw. hours, on the assumption that 100 per cent. efficiency was obtained.

In addition to this, the air that was to cause the evaporation would have to be heated to a certain temperature, say, from 50° F. to 150° F.; if the air could be humidified to full saturation, 181,100 B.Th. units would be required per hour, or 52.7 kw. hours, making a total of 344.7 kw. hours. But 100 per cent. efficiency could hardly be hoped for, for several reasons. Probably the greatest loss would be in the air itself. It would only be the skin of air, so to speak, passing over the objects to be dried, that would be operative in causing evaporation. Up to a comparatively high limit, the higher the velocity at which the air is passed over the objects to be dried, the more rapid is the evaporation, as the skin of air which receives the moisture from the object to be dried is continually being renewed. In practice, as much as ten times the quantity of air that would absorb the moisture from the objects to be dried, if still, might be driven over it, in order to obtain the rapid drying which is usually of so great importance. This would mean that 527 kw. would be required for heating the air, in addition to that required for evaporating the water itself, or a total of 819 kw.

In addition, a comparatively small amount of power would have to be supplied for driving the fan that kept the air in circulation. There would also be considerable thermal losses, but a good deal could be done to reduce these by the aid of thermal insulators.

The method suggested by the correspondent, "M. M.," who gave a solution of the question, of resistance coils placed inside perforated covers, or below the floor under gratings, is in the direction that the electrical driers will probably be developed. Steam driers have been developed to a remarkable state of efficiency, principally in America. The air-heating apparatus usually consists of what is practically a nest of small iron pipes, arranged inside a casing, with a small space between the pipes. The object to be attained is the exposure of as large a heating surface as possible to the air current passing over it, and the throttling of the air as little as possible. The electrical heating appliance will have to follow somewhat the same

lines; but it will have one very great advantage over steam heating, viz., that the whole of the mass of the electrical heater, if properly designed, should be doing useful work. With steam heaters, even when the pipes are small, one-inch pipe is the usual size; there is a core of steam that is performing no useful work. There is no electrical apparatus at present on the market that is suitable for warming air that is to be applied to drying purposes; the most suitable arrangement will have to be the result of careful experiment. The above figures, the fact that 819 kw. per hour are required for the drying operation mentioned, presumably puts it out of court. At even  $\frac{1}{4}$ d. per unit, this would mean about 34s. an hour. Steam heating could be obtained at a fraction of that cost. Probably as time goes on, and as experience is made in electrical heating, the hint given above, the elimination of thermal leakage, will lead to various economies that will bring the matter within the range of practical commercial engineering.

## USE AND MISUSE OF METAL FILAMENT LAMPS

AN informal paper by Mr. E. Handcock, entitled, "Metal Filament Lamp Lighting in Relation to the Eye," was read at a meeting of members of the Dublin Local Section of the Institution of Electrical Engineers last month. The author first outlined the action of the eye, explaining the automatic expansion and contraction of the iris according to the intensity of the brightest spot within the field of view, and explaining that the effect of bad or dim light means that the picture is not clearly focussed on the retina, and the focussing muscle keeps varying the focus to get it right, and consequently gets tired. From time immemorial, he continued, the human eye has been accustomed to the light coming from above and to having this light well diffused and not too brilliant. It demands these conditions and makes its demands felt in the form of eye-fatigue, headache, &c.

The eye is incapable of judging intensely of illumination because light falls on an object, and depending on the reflective power of that object more or less, light is reflected; it is only this varying proportion of reflected light that presents the object to the eye. Again, the inclusion of unduly bright light sources in the line of vision causes the iris to contract more than is suitable for seeing the surrounding objects. It has been found that anything with an intrinsic brilliancy over 6 has a distressing, if not harmful, effect on the eye. Glare can also result from surfaces reflecting that source, when too great a contrast is present in the light given to the retina. A very common mistake is over-concentrated local lighting; there are a very large number of people who imagine they are taking the best possible care of their eyes by having on their roll-top desks a lamp shaded from the eyes but concentrating the light on the papers and the rest of the room in comparative darkness. The effect of this is to reflect the light off their papers to the eyes, thus producing a "glare." Results were quoted with the object of showing that indirect lighting is not inefficient, and slides were shown illustrating typical installations on the "Eye-rest" indirect system, developed by the British Thomson-Houston Co., Ltd.

### DISCUSSION.

Mr. A. E. PORTE spoke strongly in favour of indirect lighting from the eye-comfort point of view. He was of opinion that every metal lamp used for direct lighting should be frosted at the bottom. Owing to the filaments being end-on to the bottom of the lamp, the amount of light lost was surprisingly small. In actual working practice he had found that the efficiency of indirect lighting was fully equal to that of direct.

Mr. TWEEDY protested against naked metal filament lamps being displayed in shop windows. He considered that a shop-keeper offending passers-by in that respect should be liable to prosecution for nuisance.

Mr. G. F. PILDITCH found it hard to persuade customers that indirect lighting was equal to direct. In one case he had proved by photometry test that the indirect method was rather better than the direct, but could not get the customer to believe it was so.

Mr. F. W. PARKES advocated a more liberal use of silvered reflectors, applied to shop-window lighting. He had found it a very economical system.

Mr. DOUGLAS asked for a definition of "glare." "Glare," he understood to mean, "light in the range of vision not coming from the object of vision and having an intensity proportionally great."

Other speakers agreed that the comfort of indirect lighting was undoubted, but opinions differed as to its comparative efficiency.

## STREET LIGHTING IN THE CITY OF LONDON

*(Concluded from p. 20.)*

Our readers will doubtless be interested in the following details of the span-wire construction:—

The span wires are fixed to rosettes screwed to mild steel plates  $\frac{1}{2}$  in. thick by means of two or more  $\frac{1}{2}$ -in. diameter mild steel bolts. The back plates are attached to the wall by two or more Lewis bolts, about  $\frac{1}{2}$  in. diameter, spaced 11 ins. apart, and penetrating 5 ins. into stonework, or 7 ins. into brickwork. In Fig. 2 a diagram is included which will explain the method of suspension. The two main cross-street span wires, the outside diameter of which is  $\frac{5}{16}$  in., consist of 19 crucible steel wires, and a central core of mild steel. In the earlier designs a core of rope was used, but this was found in time to absorb moisture, and so was liable to deteriorate. The breaking stress is about  $4\frac{1}{2}$  tons. These wires have generally a sag of about six degrees between the central headpiece and the wall. The draw wires for traversing the trolley and lowering the lamp are of the highest quality, galvanised flexible stranded steel rope  $\frac{1}{2}$  in. in circumference. The breaking stress is about 2,500 lb. All the flexible wires are impregnated with a special hydro-carbon grease to prevent electrochemical action due to moisture. The weight of the central headpiece is about 70 lb., and the lamp about 45 lb. Taking all factors into account, the working stress is equivalent to a 750-lb. stress on the attachments. All parts of the equipment are designed to meet the strains with a factor safety of 10. Tests are carried out, before any erection is passed, to at least four times the calculated stress by hanging a lead weight on a long line in place of the lamp, and setting it swinging. Measurements of extensions, sags, &c., are then made.

The equipment was assembled in the shops of the City Co., and the winches, headgear, &c., were supplied by the London Electric Firm, Ltd. (Croydon), who have for many years specialised in lamp-lowering gear, and whose existing standard designs have been modified for the heavier duty they will have to do, in conformity with the requirements of Mr. Frank Bailey, the Engineer-in-Chief of the City of London Electric Lighting Co. To Mr. Bailey and his staff we are indebted for assistance in the preparation of this article.

## CATALOGUES, PAMPHLETS, &amp;c., RECEIVED

**ALUMINIUM.**—A convenient waistcoat-pocket-sized note-book, giving much concise information on aluminium rod, tube wire standard sections, &c., as well as particulars relating to aluminium alloys, and other useful notes, has been prepared by the British Aluminium Co., Ltd. (109 Queen Street, E.C.), who will be pleased to send copies to those of our readers who are likely to make practical use of the information.

**ELECTRIC FIRES.**—A list from Neville Williams & Co. (80a Southwark Street, S.E.) describes a portable "Ensign" electric fire made and marketed by the firm. The element is run at a red heat, and is contained in a fire-box which can be readily separated from the frame, so that any one of a variety of designs may be used. The standard pattern is of simple design in iron with a copper ledge in front. Easy and cheap replacement of the heater wire is one of the good features claimed.

**G.E.C. TELEPHONES.**—The General Electric Co., Ltd., 67 Queen Victoria Street, E.C., are now distributing a revised edition of their telephone list. It is, in most respects, similar to the preceding edition, but it differs in respect to list prices, and it is for this reason that the company are anxious to get this list into the hands of contractors and others.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**ADVICE ON COUNTRY HOUSE LIGHTING.**—Under this title, Simplex Conduits, Ltd. (113-117 Charing Cross Road, W.C.), have issued a little booklet which cannot fail to be useful to owners and prospective owners of private lighting plants and their electricians. It has been prepared in answer to several requests for a publication dealing in simple language with the various uses of electricity in the average country house. Suggestions as to the arrangement of the lamps and the application of other electrical apparatus in the various rooms are given, and there are hints on the maintenance of the plant and installation. The company will be pleased to send small quantities of copies, free of charge, to any electrical contractors carrying out country house installations.

## ELECTRIC TRACTION NOTES

The National Electric Construction Co. is doing its best to get free of its difficulties in carrying out their contracts with the Oxford Corporation, and in connection with the Folkestone, Sandgate and Hythe tramway scheme, both of which lines were to have been on the surface contact system, now banned by the Board of Trade. At Oxford the powers for converting the horse lines to electric traction expire in 1914, and the trouble is to secure some system of traction which will not involve the use of overhead wires in the one-and-a-half mile of track in the centre of the city. As the conduit system is too expensive, the Company is now considering the possibility of using petrol-electric trams. As to the Folkestone scheme, the Company, as already mentioned in our columns, has deposited a Bill in Parliament authorising it to adopt trolley omnibuses. The history of this scheme is that the Company contracted with the Councils of Folkestone, Sandgate and Hythe, to construct tramways on some system not using overhead wires, and a sum of £15,000 was paid to Folkestone, £1,500 to Hythe, and £3,600 to Sandgate, in order to obtain the necessary "consents" from the Local Authorities. These sums have not only been paid, but have actually been spent by the Councils on certain road widenings. In Folkestone the £15,000 was nominally to reimburse the Council for the cost of road widening in the Cheriton Road incurred about two years before the Company obtained powers for the tramway, and in one of the other cases, we believe, the road widening was carried out in a road not even on the line of the proposed route. The Company have already tried unsuccessfully to obtain permission from the Councils to erect overhead wires, and their Bill will presumably meet with opposition from all three Councils. There is also a clause in the Bill which states that if, within six months of the passing of the Act, the Councils agree with the Company not to proceed with any scheme, they shall repay the sums received from the Company mentioned above.

A committee is to be appointed by the Bristol Corporation to consider the question of purchasing the Bristol Tramway Company's undertaking.

The Sheffield Tramways Committee have contributed £2,000 from the special purposes fund towards the cost of extending the Applied Science Department of the University.

TELEPHONY AND TELEGRAPHY  
(INCLUDING WIRELESS)

Major Archer-Shee, who wrote the much-discussed article in the *National Review* last September, gave evidence last week before the House of Commons Committee which is considering the Imperial wireless telegraph scheme. He said he was a strong supporter of State control and management, and recommended that the Admiralty or Post Office should deal with this matter directly. Further, he could not understand why such special consideration was being given to the Marconi Co. whilst other companies had not even been asked to tender. Whilst he considered that an ordinary cable system would be more efficient for Imperial communication, he was not antagonistic to wireless telegraphy, but nevertheless thought that if a Technical Committee had been set to work to test the various systems, the Marconi system would not have been the selected one. Already in the House of Commons Major Archer-Shee has dissociated himself from any of the charges made against Ministers. The suggestion now made was that the Committee should present an interim report recommending the acquisition of sites in order to make a commencement with the work, pending a report by Technical Committee as to the best system to adopt. Mr. V. Gandil, the representative in England of the Poulsen system, was closely cross-examined with regard to the financial resources of the Poulsen Co., and the work which it had carried out. He was unable to tell the Committee between which two points, apart from San Francisco and Honolulu, the system was in daily communication, but he complained of the view expressed by Sir Alexander King, Secretary to the Post Office, that the Poulsen system would be unable to meet the requirements of the contract, as being a most damaging one. He suggested to the Committee that it should not be taken seriously, as

# ADAMS IGRANIC

Specialists in Electric Motor Starting and Control Gear.

Adams & Co. Ltd. Balfour House, Finsbury Pavement, London, E.C. Works-Bedford.

Sir Alexander King was a layman, and had no technical knowledge. It was pointed out to him by the Committee, however, that the statement in question was made on the advice of the Post Office experts. Mr. Gandil further stated that had the Poulsen Co. been given an opportunity to tender for the scheme, they could have given financial guarantees for carrying out the work, and would have certainly been prepared to quote less than £60,000 per station. The solicitors to the English Poulsen Co. have also given evidence, the tone of which was one of complaint at the attitude of the Government towards the Poulsen system.

The report of the American Marconi Co. shows that considerable progress has been made during the past six months. Not only has the business of the United Wireless Telegraph Co. been taken over, but an additional 200 vessels have been equipped with the Marconi system. The net profits for the six months to the end of August amount to £5,000.

On the first day of the year the line between Bagdad and Bassorah was down, but was working normally on the 2nd inst.—The Compagnie Française des Câbles Télégraphiques cable between Paramaribo and Cayenne is also interrupted. Telegrams for the latter place are being despatched by every opportunity.—The two routes between Indo-China and Siam were down on the 2nd and 3rd inst.—The Fao route was down again from the 4th to the 6th inst.—The line between Otranto and Vallona ceased working on the 6th inst.—It is understood that extensive repairs are being undertaken in connection with the Direct Atlantic Cable, and that the work has been secured by Messrs. Siemens.—Some disturbance to the normal flow of Atlantic Cable traffic has been caused by failure of landlines and connecting cables in Ireland. This has been put right.—Mr. Baxendale, late of the Pacific Cable Board, is now in New York on the business of the Wireless Company, with which he has now become identified.—An important new cable is to be laid in the East shortly, and is already being manufactured.

## LOCAL NOTES

**Aberdeen: Trouble with Electrical Contractors.**—In consequence of statements made in a certain letter recently, Mr. J. A. Bell, the City Electrical Engineer, has entered an action against some local electrical contractors for £1,000 damages.

**Accrington: Gas Power Plant.**—The gas power generating plant is now practically complete, and was given a thoroughly satisfactory ten-hour run under full load conditions last week.

**Batley: Proposed Electricity Extensions.**—The respective advocates for extending the Municipal electricity works, and of taking a supply in bulk from the Yorkshire Electric Power Co., are providing the local newspapers with some interesting reading matter, for as soon as one member of the Council champions the first course of action, another replies with strong advocacy of the bulk supply scheme. The Council itself has not yet come to any conclusion.

**Belfast: The New Power House.**—A deputation of ratepayers waited upon the Corporation last week to ask that the proposal to construct a new power station should be postponed for the present. The deputation was composed of representatives from many of the large works in Belfast, and the chief ground for the request is the possibility of a mistaken policy on the part of the Council in deciding upon steam generating sets, in view of the developments in connection with the Diesel engine. Another reason for urging delay was that the present is a bad time for borrowing money. It appears that Messrs. Harland and Wolff have decided to instal Diesel engines in their large power station, and have, after a period of working, offered to place the results before the Corporation. Hence another reason for delay.

**Brighton: A Peculiar Mishap.**—Although only causing an interruption to a small section of the supply for ten minutes,

an accident which occurred at the Brighton electricity works and town sub-station on Friday evening last presents some points of considerable interest. One of the high-tension coils on the stator of a 1,300-h.p. induction motor at the sub-station went to earth, and the oil switch controlling the machine failed to trip on one leg, with the result that the arc was maintained and the resistance, earthing the neutral of the machine at the power-house, was burnt out, and the drop in the H.T. voltage caused the other induction motors running in parallel to trip their circuits. There was further trouble at the power-house, which, however, did not in any way interfere with the supply. The earth wire connecting the neutral point of one of the machines with the earth resistance bus wire was composed of only ordinary grade insulated cable, and when the earth resistance was blown to pieces, the loose end of this cable fell foul of the lead-covered three-core cable connecting the alternator with its oil switch, and before the defective leg on the oil switch at North Road had been knocked out, this wire became red-hot, and seared a hole in the lead sheathing of the machine cable, causing a "short" between one phase and earth. The machine circuit was instantly cut out and the field circuit broken, and no damage was done to the machine, but the cable, however, was nearly burnt in two. Mr. Christie advises central station engineers to make the cable in connection with the earthing of the neutral of a three-phase machine of the same quality insulation and as carefully supported mechanically as the high-tension circuit up to the earthing resistance.

**Gromer: Proposed Sale of Electricity Undertaking.**—The ratepayers are not disposed to allow the decision of the Council to transfer the electricity undertaking to Messrs. Edmundson's without very strong effort to prevent it. A three hours' public meeting took place last week, and on a poll being taken, there was a majority of more than 2 to 1 against the transfer.

**Essex: Electric Supply.**—The County of London Electric Supply Co. propose to acquire 34 acres of land in Dagenham with a frontage to the Thames for the purpose of a generating station.

**London: Woolwich: Position of Electricity Undertaking.**—The loan of £19,000 recently sanctioned by the L.C.C. for extensions to the electricity works was on the understanding that the Council repays within three years the outstanding balance amounting to £9,228 of loans for machinery and plant at the Plumstead Station, which will be rendered obsolete by the adoption of the £40,000 scheme referred to on p. 713 of our issue of Dec. 19th, 1912.

**Nottingham: Water Power Scheme.**—We reported some time ago that, on the initiative of Alderman A. Ball, the Corporation decided to obtain reports on the possibilities of using two weirs in the district for generating electricity. Accordingly, Mr. E. W. Monkhouse, of Westminster, took the matter in hand at the request of the Corporation and has now reported. This report shows at once that the scheme would be a financially unsound one. The total brake horsepower obtainable from one weir at low water is only 160, and from the other it is only 180, and the figures show that the expenditure of £52,869 which would be necessary would result in a loss of £191 per annum, whereas with the same capital expenditure on an up-to-date steam plant, assuming a 22 per cent. load factor, there would be a profit of £8,902 per annum. Mr. Monkhouse definitely recommends the Corporation to give up the idea of water power, and when the time comes for making extensions to put down a thoroughly up-to-date steam plant.

**Suffolk: Purchase of Electricity Co.**—The Suffolk Electricity Co., which owns works at Felixstowe, Diss and Stowmarket, is considering an offer of purchase by Dr. C. H. Leibbrand.

**The Effect of Electric Radiator Heat.**—We have received an interesting photograph from the Dowsing Radiant Heat Co., Ltd., which shows that so intense was the heat given out by a Dowsing radiator which was on show in the window of Messrs. Troy & Co., of Hampstead, that the glass was unable to withstand it, and was cracked severely.

# "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

## Specifications Published Jan. 2, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

27,342/11 and 27,345/11. **Extracting Metals from Ores.** H. S. MACKAY. These specifications relate to those processes where chlorine is used as the reactive agent. Chlorine acids are produced by electrolysis, and the ore is then treated with this solution, the resulting solution being again electrolysed, and after this again used for treating the ore, and so on. By one method a solution of sodium chloride is electrolysed in the presence of copper. For ores containing sulphate, a chloride of an alkaline metal is used. Treatment for ores containing sulphur is also given. One figure to each specification.

27,836/11. **Melting Metals and Alloys.** R. S. WILE. The method does not apply to iron and steel. To prevent oxidation, a thin layer of glassy or slag-like material is allowed to form on the molten surface. This acts as the resistance of a tilting electric furnace, and so is kept sufficiently hot without it being necessary to raise the molten metal up to boiling point. Three figures.

3,650/12. **Small Variable Speed Dynamos.** C. SCHLICK. A variable-speed dynamo for lighting vehicle-lamps has on its armature a coil which is automatically short-circuited by a centrifugal switch, and so acts demagnetisingly, when a pre-determined speed is reached. At low speeds the demagnetising coil helps the main coil. Nine figures.

6,987/12. **Adjustable Condenser for Wireless.** A. C. COSSOR, Ltd., and H. J. STENNING. The condenser is made of small size by winding alternate layers of insulating and conducting materials on to a bobbin, and varying the number of layers. One way is to have a central bobbin surrounded by four others, alternately carrying conductor and dielectric. By revolving the central bobbin the desired result is obtained. Three figures.

7,486/12. **Control for Screw-cutting Lathes.** C. G. M. BENNETT and L. S. FOSBROOKE. This specification describes an electrical arrangement devised to do away with the necessity for chalking the change wheels when cutting odd threads. The lead screw can only be engaged when its position relatively to that of the mandril is correct. The arrangement was described in *ELECTRICAL ENGINEERING*, October 10th, 1912, p. 562.

8,058/12. **Incandescent Lamp with Bipartite Bulb.** P. WEISSE. The lower edge of the cup, which extends conically downwards, is embedded in the trough-shaped outer edge of the filament carrier to reinforce the joint. The diameter of the opening of the bulb allows the filament carrier to be removed without melting any part of the glass. One figure.

12,869/12. **Manufacture of Tungsten and Molybdenum in Ductile State.** WESTINGHOUSE METALLFADEN GLUHLAMPENFABRIK. The metal or alloy to be treated is first heated, and then cooled slowly while under pressure. This is effected by embedding the body in a molten mass or heated mould, which cools slowly and so exerts the required pressure.

## Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad. Summaries of some of the more important of these patents will appear in our next issue.

**Arc Lamps:** WORSLEY [Raising and lowering gear] 28,668/11.  
**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** KALLMANN [Conductors] 28,459/11; BRITISH THOMSON-HOUSTON Co., TAYLOR, WHITAKER, and SPORBORG [Distributing] 3,532/12; BROOKING and ST. HELENS CABLE & RUBBER Co. [Insulating boots] 17,864/12.

**Dynamos, Motors, and Transformers:** BROWN, BOVERI & Co. [D.C. dynamo pressure regulation] 28,486/11; BRITISH THOMSON-HOUSTON Co. and GARTON [Generators] 4,529/12; WARWICK MACHINERY Co. (1908) (*G.E.C., U.S.A.*) [Turbo-dynamos] 7,497/12; BRITISH THOMSON-HOUSTON Co. (*G.E.C., U.S.A.*) [Vapour rectifiers] 7,775/12; BERGMANN A.-G. [Speed regulation of asynchronous motors] 12,134/12; ALGEMEINE ELEKTRICITÄTS-GES. [Power machine plant] 16,517/12.

**Electrochemistry:** BAUER [Regenerative production of Roentgen rays] 15,171/12.

**Ignition:** SIEMENS & HALSKE [Distributors] 19,069/12.  
**Incandescent Lamps:** FRENOT [Combined bulb and diffuser] 13,796/12.

**Meters:** SCHUPPISSEY [Excess load] 13,602/12.

**Storage Batteries:** TAYLOR [Separators] 28,858/11 and 28,859/11.

**Switchgear, Fuses, and Fittings:** BRITISH THOMSON-HOUSTON Co. (*G.E. Co., U.S.A.*) [Contacts and electrodes] 535/12; LUCAS and JACKSON [Battery terminals] 9,278/12; MERRIAM [Switches] 14,752/12; MOWRER [Terminal plugs] 23,564/12; STOTZ & COMPAGNIE ELEKTRICITÄTS [Plug] 23,877/12.

**Telephony and Telegraphy:** WALL [Telephone meters] 1,157/12; MARCONI'S WIRELESS TELEGRAPH Co. and ROUND [Receivers] 3,055/12; MUIRHEAD [Reception of "call up" signals in wireless] 3,445/12; RAMDOHR [Telephones] 16,241/12; HEINICKE and JASPER [Wireless] 18,632/12; IMRAY (*Compagnie Generale Radiotelegraphique*) [Adjusting length of spark gaps] 26,457/12.

**Traction:** EVANS [Deadening noise of trains in tubes, &c.] 28,031/11; COOKE and JOHNSON [Insulating fish plate] 6,717/12; COOKE and SCHENCK [Station indicator for vehicles] 9,360/12; WHITE (*Carson*) [Automatic block signalling] 10,208/12.

**Miscellaneous:** SIBLEY [Automatic piano players] 7,369/12.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Arc Lamps:** GENERAL COMPOSING Co. GES., 28,503/12.

**Distributing Systems, &c.:** SOC. INTERNATIONALE DE LUMIÈRE FROIDE [Lighting] 28,229/12.

**Dynamos and Motors:** SOC. ANON. WESTINGHOUSE-LEBLANC [Automatic balances for rotors] 16,809/12; SIEMENS SCHUCKERT-WERKE GES. [Safety device for] 28,483/12.

**Ignition:** RUPRECHT [Spark plugs] 28,412/12.

**Incandescent Lamps:** FISCHER and ZIMMERMANN [Incandescing bodies] 24,875/12.

**Miscellaneous:** HASLER ART.-GES. [Speed indicators] 17,045/12.

## Opposition to Grant of Patents.

20,207/11. **Spark-Plugs.** H. G. LONGFORD, W. W. LONGFORD, and W. A. CLARK. The opposition to this patent has been unsuccessful, and the grant allowed.

5,551/12. **Production of Adjustable Frequency.** K. ZICKLER and R. CZEPEK. The opposition to the grant of this patent by Mr. W. P. Durnall (*see ELECTRICAL ENGINEERING*, September 26th, 1912) has not been successful. The grant is allowed.

## Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

516 of January 9th, 1899. **Telegraph Relays.** A. MUIRHEAD. The following details are covered by this specification: A means by which the mechanism which imparts directive force to the signal coil effects electrical variations in the local circuit. A method of imparting a constant tremor to the contact-maker through a friction gear, so that it may keep to its true zero position. The mechanism actuating the contact-maker is curbed by means of an "overflow" connection between the two circuits. The apparatus may be affixed to a siphon recorder, and may be duplexed. Nine figures.

517 of January 9th, 1899. **Type-printing Telegraphs.** C. D. ABEL (*Siemens & Halske*). The same apparatus may be used as transmitter and receiver by untrained persons. A number of constructional details are protected. Three figures.

537 of January 10th, 1899. **Automatic Reversible Booster.** J. S. HIGHFIELD. The armatures of a motor, exciter, and booster are all mounted on one shaft. The currents from the exciter oppose those from the source of energy and excite the field magnet of the booster, the armature of which is in series with the source of energy and the load.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Switchgear, Fuses, and Fittings:** A. F. BERRY [Thermally controlled electro-magnetic switches for cutting in and out supplementary transformers] 19,015 05; J. BOOKER [Combined motor starters and speed regulators] 20,560 06.

**Telegraphy:** SIEMENS BROS. & Co. (*Siemens & Halske*) [Polarised relays for high-speed working] 19,877 03.

**Traction:** R. A. HADFIELD and D. GALBRAITH [Conduits for tramways, &c.; construction at junctions] 20,240 02; SIEMENS BROS. & Co. (*Siemens & Halske*) [Hand levers for block signalling] 20,779 07.

**Miscellaneous:** F. G. JAHN [Postmarking and cancelling machine] 16,607 00; I. SUTHERLAND [Moving picture targets] 20,586 07.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

**Accrington.**—A sub-station is to be erected to deal with the Clayton-le-Moors district.

**Bath.**—The Local Gas Co. opposed at an inquiry last week into a loan of £8,000 for extensions to the electricity undertaking. The proposed loan consists of £3,000 for laying electric mains in Weston, a district recently incorporated with the city; £2,250 for prospective expenditure on mains during the next three years; £2,250 for house services, and £500 for transformers. Of these amounts £1,394 have been spent in anticipation of the loans on mains, £1,561 on services, and £240 on transformers. The Local Gas Co. was represented by Mr. Vesey Knox, K.C., the main point made on their behalf being to secure the insertion of the Northumberland clause as regards the extension into Weston, in order to prevent any call on the rates in which the Gas Co. would have to take part.

**Birmingham.**—Having definitely decided to erect a large new power station at Saltley with a total ultimate capacity of 100,000 kw., the Electric Supply Committee and their engineer and secretary are to visit London, Newcastle-on-Tyne, Glasgow and Liverpool, to inspect power stations there, before deciding upon the details of the new scheme.

**Doncaster.**—Extensions to the electricity works are contemplated.

**Ellesmere Port.**—A site has been approved for a generating station, and an expenditure of £15,000 is contemplated under the Council's Provisional Order now before the Board of Trade.

**London: Stepney.**—A loan of £18,000 for new machinery and mains is to be applied for.

**Maidstone.**—The provision of an additional reciprocating engine set is recommended at a cost of £5,620.

**New Zealand.**—The Thames Council require tenders by Jan. 30th for two 100-kw. Diesel engine sets with switch-board, mains, street lighting equipment, &c. A stipulation of the scheme is that the feeders and distributors are to be of aluminium. Further particulars at 73 Basinghall Street, E.C.

**Oldham.**—The installation of a 1,500-kw. turbo-alternator, and two 500-kw. motor-alternators, at an estimated cost of £13,000, is recommended by the Borough Electrical Engineer in order to meet the heavy demand which is coming in for power from large mills. In addition £9,500 will be necessary for mains, £1,200 for switchgear, and £5,000 and £1,800 for future expenditure on mains and transformers respectively.

**Stalybridge Joint Board.**—A loan of £20,000 is to be taken up for extensions to the Joint Board's electricity works.

In addition to the extensions of area mentioned in these columns in recent issues, the following municipalities are applying to the Board of Trade for powers to extend their electric lighting areas, and in connection with which orders for electrical plant and machinery may be anticipated:—Beckenham, Derby, Doncaster, Neath, Stoke-on-Trent, Watford and Wolverhampton. Extensions by companies in the following areas are also to be made:—Barnet, Dartmouth, Leatherhead, Northwood, Smethwick and Wellingborough.

### WIRING

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Aberdeen.**—New baths.

**Chester.**—New buildings at Upton Hospital. H. Beswick, Newgate Street. Jan. 20th.

**Dublin.**—Considerable extensions to joint hospital. Architect, T. F. McNamara, 192 Great Brunswick Street.

**Hamilton.**—£30,000 hospital.

**Haslingden.**—New Council school.

**High Wycombe.**—Grammar school.

**London.**—Electrical Installations at Camberwell School of Arts and Vauxhall Street elementary school for L.C.C. (See an advertisement on another page.)

**Manchester.**—New goods offices for L. and Y. Railway.

**Portsmouth.**—Extension to the electrical equipment of workhouse.

**Swansea.**—Three hundred workmen's houses. Town Clerk.

New municipal buildings.

**Tenbury.**—Electric lighting of workhouse.

### MISCELLANEOUS

**Australia.**—The Deputy Postmaster-General at Perth requires 2,165 ft. of lead-covered paper-insulated telegraph cable. Further particulars at 72 Victoria Street, S.W., or 73 Basinghall Street, E.C.

**Birmingham.**—The Tramways Committee are advertising for their annual supply of stores, which includes electrical sundries. General Manager. Jan. 27th.

**London: L.C.C.**—Three-and-a-half miles of 4'0 grooved trolley wire. Clerk to Council. Jan. 14th.

**N.E.R.**—It is stated that the North Eastern Railway Co. propose to extend their electric lines in the Newcastle area at a cost of £30,000.

**Plymouth.**—Twelve months' supply of arc-lamp carbons, meters, &c. Borough Electrical Engineers. Jan. 23rd.

**South Africa.**—The Germiston Council requires a trolley bus installation.

**West Ham.**—Engine-room supplies, chemicals, A.C. house-service wattmeters. Electrical Engineer. Jan. 24th. (See an advertisement on another page.)

## TENDERS RECEIVED AND ACCEPTED

**Bristol.**—The tenders of the British Westinghouse Co. and Messrs. Bruce Peebles and Co. for the supply of electrical apparatus at £903 and £2,187 10s. respectively, have been accepted.

**Eccles.**—The tender of the British Westinghouse Co. for a twelve months' supply of meters has been accepted.

**Hull.**—The tender of Messrs. Cox, Walkers, Ltd., at £1,129 has been accepted for the electric wiring and fitting of the teachers' training college, Cottingham Road. This is the lowest tender, the highest being £1,460.

**London.**—According to the *Railway Gazette*, contracts have been let for a portion of the work for linking up the North London Railway with the Underground system of London.

**Talcahuano (Chile).**—Messrs. Gillespie & Beales, purchasing engineers for Messrs. Martin Bros., Valparaiso, have placed the following orders:—Generators, Messrs. Laurence Scott; battery, &c., Hart Accumulator Co.; switchboard, Messrs. Ferranti; cable, Messrs. W. T. Glover & Co.; crane, Messrs. Holt and Willetts; steel poles, Messrs. Stewarts & Lloyd; lanterns and fittings, Mr. Hadyn Harrison.

## APPOINTMENTS AND PERSONAL NOTES

Mr. C. E. C. Shawfield, who has been engineer-in-chief to the Wolverhampton Corporation Electricity Works since 1898, and prior to that was Chief Assistant for two years, has resigned in order to take up an appointment as Joint Managing Director with the Knowles Oxygen Co., of Wolverhampton, who manufacture oxygen and hydrogen gases by an electrolytic process. Mr. Shawfield's resignation, which takes effect in about three months' time, will necessitate his giving up the presidency of the I.M.E.A. We understand that his resignation will be formally tendered at a Council meeting this month, when it is expected that Mr. R. A. Chattock (Chief Electrical Engineer of the Birmingham Corporation), the senior vice-president, will be nominated for the year. In all probability, however, the meeting will be held in London, as originally arranged, and not in Birmingham.

We are very pleased to be able to announce that Mr. W. J. U. Sowter, the Borough Electrical Engineer at Bray, has now sufficiently recovered from the effects of the serious accident he met with in July last, when a compressed air cylinder used in conjunction with a Diesel engine there burst, to enable him to resume charge of the Bray Electricity undertaking. As we have since announced in our columns, Mr. McDonnell, the Assistant Engineer at the time of the accident, and who was also injured, but fortunately not seriously, has now left the service of the Council and Mr. V. Dempsey, of the Galway Electric Supply Co., has been appointed his successor at a commencing salary of £104 per annum.

Messrs. Bruce Peebles, Ltd., have appointed Mr. Lee Murray to the Board. Mr. S. E. Bastow and Mr. J. H. Bunting have been appointed Joint Managers of the Company in place of Mr. Lee Murray.

The Manchester Electricity Committee recommend the appointment of Mr. H. Lamb as Resident Engineer at the Stuart Street generating station, at a commencing salary of £350.

Mr. C. N. Hefford has been appointed temporarily to take charge of the Leeds Electricity undertaking.

In consequence of Mr. Dickinson's removal to Liverpool, the duties of Hon. Secretary of the Yorkshire Section of the I.E.E. will in future be carried on by Mr. J. D. Baillie, Messrs. C. A. Parsons and Co.'s Leeds representative.

Mr. Dundas Fox, Manager of the Penrith Electric Supply Co., has severed his connection with that Company and has made arrangements to proceed to Canada with Mr. J. W. Bleasdale, his assistant engineer, to commence business as consulting engineers. Mr. J. W. Speight, who has hitherto been connected as Consulting Engineer to the Penrith Co., has taken over the managership.

The salary of Mr. G. F. Nayler, Chief Assistant Electrical Engineer at Nelson, has been increased from £140 to £160 per annum.

Mr. E. Jaeger has been appointed London Manager of Messrs. Jaeger Bros., 18 Christopher Street, Finsbury Square, E.C., in succession to Mr. H. Steinbach.

A chief assistant is required in Technical Department of the Union Cable Co. (See an advertisement on another page.)

Laboratory assistant required at South Western Polytechnic. (See an advertisement on another page.)

Jointer wanted in South Wales, accustomed to E.H.T. three-core paper cables. (See an advertisement on another page.)

**An Unusual Application of the "Magnet" Iron.**—An interesting case has just come to our notice of the use of an electric iron. During the recent cold spell in the North, a customer of the General Electric Co., Ltd., became anxious for the safety of his motor-car, in consequence of the danger of the water in the radiator freezing. For some reason a supply of oil for the heating lamp usually employed in the garage could not be obtained. Possessing a 6-lb. "Magnet" Electric Iron, he hit upon the excellent idea of connecting it to a lamp-holder in the garage and placing it in the bonnet of the car. The effect was entirely satisfactory, and we are pleased to learn that the customer referred to has lost no time in purchasing a G.E.C. Electric Heater for his garage.

#### MISCELLANEOUS.

**F. H. LOVELL & COMPANY,**  
of  
**ARLINGTON, NEW JERSEY,**  
U.S.A.

#### DESIRE TO ANNOUNCE

That they maintain a large and well-equipped Brass Foundry, Machine-shop, and Finishing Rooms suitable for the manufacture or assembly of electrical and steam specialities. They are in close touch at all times with the U.S. Navy Department and the leading companies, whose patronage they have enjoyed for many years. They are therefore peculiarly fitted to handle under the new provisions of the new U.S. Act governing the free importation of material used in shipbuilding, such raw materials and such devices as can be imported in part and assembled here.

They solicit the inquiries of all those who are desirous of obtaining capable U.S. Agents for the handling of their products.

### MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith and Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £81 15s. to £82. (Last week, £81 10s. to £82.)

**Patent for Sale.**—A patent of electric current regulators is offered for working in this country. (See an advertisement on another page.)

It is desired to work in this country a patent for improvements in forecarriages for motor-cars. (See an advertisement on another page.)

**Armorduct Manufacturing Co., Ltd.**—This Company state that they have acquired the sole licence for the manufacture and sale of Mr. Napier Prentice's "Lightning" Cooking Oven, and that they will be placing it on the market some time in February. They also announce that they are making further large extensions at their Witton Works to cope with the increasing demand for their specialities.

**Electrical Engineering and Equipment Co.**—This Company has taken over the agency of the Vereinigte Isolatorenwerke of Berlin, with the exception of traction material.

**Bankruptcies.**—The public examination of Messrs. Samuel Lord and W. Sutton, electrical engineers, Redcross Street, Liverpool, took place last week. There are unsecured liabilities of £3,340 with only £3 10s. assets. The debtors traded as the Howe Electrical Engineering Co., and the failure is attributed to the large sum of money spent on the development of certain patents.

**National Telephone Co.**—Creditors are requested to send in particulars of their claims not later than February 1st, to G. Franklin, Telephone House, Victoria Embankment.

**Dissolution of Partnership.**—Mr. A. J. Boulton has retired from Messrs. Boulton, Wade & Tennant, Patent Agents, 111 and 112 Hatton Garden, E.C. The business will continue as usual.

**Willans & Robinson.**—The accounts for the year to June 30th, 1912, show a trading loss of £20,881, after setting aside £18,607 for depreciation and debenture interest. A scheme, which will involve the entire rearrangement of the share capital of the company, is to be submitted to the shareholders to-day. This embraces a working arrangement with another English engineering firm (one which has for six years paid 20 per cent. per annum to their ordinary shareholders), who will invest some new capital in the company, and will, it is suggested, be able to place regularly with the company a large number of orders at remunerative prices.

### CALENDARS AND SOUVENIRS FOR 1913

We are very pleased to receive a most substantial desk blotter and diary of subdued design in their usual style, from A. Graham & Co. (St. Andrew's Works, Crofton Park, S.E.). This firm have also presented us with a useful little book, giving the daily tide tables for the principal seaports of the United Kingdom, port charges, knot tables, distance tables, together with electrical tables, &c.

A tear-off wall calendar from the Westinghouse Brake Co., Ltd. (Chain Department, 82 York Road, King's Cross, N.), illustrates the Company's rocker joint chain.

A wall calendar from the Jandus Arc Lamp & Electric Co., Ltd. (Hartam Road, N.), is embellished with an excellent reproduction of an original water-colour, specially prepared for this occasion. The firm will be pleased to forward a copy of this calendar to any of our readers interested in their manufactures.

A small but bold and clear wall calendar—one sheet to a month—has been received from Nalder Bros. & Thompson, Ltd. (34 Queen Street, E.C.).

The Liverpool Electric Cable Co., Ltd., have printed on their wall calendar for 1913 a striking picture of their new works in Bootle, Liverpool. The calendar itself will be useful for office purposes, as the figures are printed in white on a dark green background, and stand out very prominently.

We have received a copy of a practical telephone card from the Benjamin Electric Co. (117 Victoria Street, S.W.).

## SUMMARY

An article, based on a paper and discussions at the Institution of Electrical Engineers, reviews the various methods possible for improving the power factor in A.-C. systems, and in particular the Miles Walker phase advancer, which is suitable for use with large motors. It is similar to the Scherbius machine with the addition of a field magnet. The question as to whether con-

densers are still too costly for general use was debated, and it appears that over-excited synchronous motors are too expensive to employ as phase advancers when large currents are in question. (Page 31.)

OUR "ELECTRICAL ENGINEERING Literary Section" contains a list of new publications, reviews of a number of technical books, and gives a selected list of recommended works on all branches of electrical engineering. (Page 33.)

ON the advice of Mr. J. F. C. Snell, the St. Marylebone Borough Council have decided to adopt the three-phase system of generation at their power station, and have ordered two 3,750 K.V.A. Oerlikon turbo-alternators. (Page 37.)

A GENERAL exposition of the steam end of turbo-generators was given on Tuesday by Mr. J. P. Chittenden before the Rugby Engineering Society. (Page 37.)

A NEW enclosed reversing switch and an electric tea-making equipment are described in short illustrated articles on pages 37 and 38.

THE prominent question of the improvement of power factor on A.-C. systems is well treated in reference to the use of over-excited synchronous motors or rotary-condensers in conjunction with induction motor-loads in our "Questions and Answers" columns. (Page 39.)

A FURTHER report has been issued regarding the conversion of the Berlin suburban railways to electric traction. Schemes for the adoption of electrical working on the local lines in Vienna are also under consideration. (Page 40.)

JUDGMENT for £12,515,264 was given by the Railway and Canal Commissioners on Monday last as the value of the National Telephone Company's undertaking. The straight line method of depreciation was held to be the more suitable, and "physical" life of plant was taken, though the lives assigned by the Company were reduced for various reasons. The only point upon which the Commissioners were not unanimous was the charge for raising capital, but this was allowed by a majority of 2 to 1.—The House of Commons Committee has recommended the appointment of an independent sub-committee to test and report upon wireless telegraph systems within three months.—The extension of the underground telegraph and telephone mains to the North of Scotland is stated officially to be a commercial impossibility. (Page 40.)

THERE is some difference of opinion in the Sheffield Corporation as to continuing the wiring department.—The West Hartlepool waste heat power scheme will shortly be put into operation.—The Dublin Corporation have decided upon a maximum salary of £200 per annum for shift engineers.—The Rhyl Corporation are

adopting the "rateable value" system of charging.—Opposition is threatened at the forthcoming audit of the Marylebone electricity accounts.—Considerable complaint is being made as to smoke nuisance from the Salford electricity works. (Page 41.)

A PATENT covering various details in the connections to and mechanism of a submarine relay by S. G. Brown expires during the current week after a life of fourteen years. Among the Specifications published by the Patent Office on Thursday last were three relating to wireless. The Bergmann A.-G. are protecting the use of a direct-coupled exciter to a rotary for induction motor control, an electrolytic excess-current meter is covered by E. Schuppiser, and the B.T.-H. Co. claim the use of wrought tungsten for contacts subjected to high temperature. (Page 42.)

THE Sheffield tramways and lighting power-houses are to be linked up. A 120 kw. reciprocating set and switch-gear is required at Colwyn Bay; rotary converter plant by an Indian company; traction battery, booster, and switchgear at Nelson; steam turbine plant at Lincoln, and a switchboard at Salford. Extensions are contemplated at Watford, £12,564, and Gravesend, £10,000. Street electric lighting is to be carried out at Nuneaton, and miscellaneous stores are required at Belfast and Cheltenham. (Page 43.)

**Electrical Concerts.**—Last Friday, by a peculiar coincidence, the Electroharmonic Society and the Batti-Wallahs held their smoking concerts simultaneously at the Holborn Restaurant—needless to say, in different rooms. At both there was a good attendance, and at the Batti-Wallahs Society in particular there were far more members and visitors present than usual; the total attendance at this concert was 157. Several members divided their favours between the two societies.

## ARRANGEMENTS FOR THE WEEK

FRIDAY, JANUARY 17TH.

*Royal Institution.*

9 p.m. Evening discourse. "Further Applications of the Method of Positive Rays," by Prof. Sir J. J. Thomson, F.R.S.

MONDAY, JANUARY 20TH.

*Institution of Electrical Engineers: Newcastle Section.*

7.30 p.m. At Armstrong College. "Electric Resistance Welding," by P. Bucher. (An abstract of the Paper and discussion in Manchester was published in our issue for January 2nd, p. 7.)

TUESDAY, JANUARY 21ST.

*Institution of Electrical Engineers: Newcastle Section.*

7.30 p.m. At Literary and Philosophical Society, Middlesbrough. Mr. Bucher will repeat his Paper as above.

*Institution of Electrical Engineers: Manchester Students' Section.*

7.30 p.m. At Municipal Technical School. "Street Photography," by S. E. W. Taylor.

THURSDAY, JANUARY 23RD.

*Institution of Electrical Engineers.*

8 p.m. "The Use of a Large Lighting Battery in Connection with Central Station Supply," by F. H. Whysall.

FRIDAY, JANUARY 24TH.

*Royal Institution.*

9 p.m. Evening discourse. "Recent Advances in Scientific Steel Metallurgy," by Prof. J. O. Arnold, F.R.S.

*Association of Mining Electrical Engineers.*  
East of Scotland Branch. Meeting at Dunfermline.

## The London Electrical Engineers.

THURSDAY, JANUARY 16TH. C. Company.—Company Training, 7 to 10 p.m.

FRIDAY, JANUARY 17TH. D. Company.—Recruit Training, 7 to 10 p.m.; Company Training, 7 to 10 p.m.

SATURDAY, JANUARY 18TH. D. Company.—Week-end run at Fort Coalhouse. No arms or equipment will be taken. Parade at Fenchurch Street Station at 3 p.m. Headquarters will be opened for Regimental business from 10 a.m. till 12 noon.

MONDAY, JANUARY 20TH. A. Company.—Recruit Training, 7 to 10 p.m.; Company Training, 7 to 10 p.m.

TUESDAY, JANUARY 21ST. B. Company.—Recruit Training, 7 to 10 p.m.; Company Training, 7 to 10 p.m.

THURSDAY, JANUARY 23RD. C. Company.—Company Training, 7 to 10 p.m.

FRIDAY, JANUARY 24TH. D. Company.—Recruit Training, 7 to 10 p.m.; Company Training, 7 to 10 p.m.

SATURDAY, JANUARY 25TH. A. Company.—Week-end run at Fort Coalhouse (as for D. Company last week). Headquarters open from 10 a.m. till 12 noon.

**MAINS ENGINEER TO APPLICANT FOR POST OF JOINTER:**—Oh, so you've worked on Low and High Tension mains—ever had a shock?  
**JOINTER:**—Yes, sir, four, sir, two of 'em fatal!

## PHASE ADVANCERS

THE question of the design of apparatus for improving the power-factor in A.-C. systems was discussed last week in a Paper by Professor Miles Walker (Manchester Municipal School of Technology), both at the Birmingham Local Section of the Institution of Electrical Engineers and at the London meeting. The Paper may be regarded as an extension of the one which Professor Walker read before the I.E.E. in 1909 (ELECTRICAL ENGINEERING, Vol. V., January 21st, 1909, p. 65, and May 6th, p. 420).

The apparatus now in use for improving power factor is as follows:—The over-excited synchronous motor, the static condenser, the Scherbius phase advancer, the Kramer phase advancer, the Kapp vibrator, and the Miles Walker phase advancer. The synchronous motor is expensive to instal, as a large machine is necessary. This is brought out, incidentally, in our Questions and Answers columns in this issue. The static condenser suitably designed for the purpose in view could be obtained in 1909, according to Mr. W. W. Mordey (ELECTRICAL ENGINEERING, Vol. 5, May 27th, 1909, p. 481), at a less cost than a synchronous motor, and with only a quarter the annual losses. In the discussion in London, Mr. A. W. Ashton spoke strongly in favour of condensers. The initial cost is, he said, about £2 8s. per k.v.a., and is practically independent of pressure. Further advantages of condensers are great strength mechanically, ability to stand overloads of 300 per cent. and a temperature rise of 30° above normal.

On the other hand, Mr. A. M. Taylor (Birmingham) had found, on going into the cost, that this was prohibitive, as the expense per kw. would amount to something like £5. He thought that, as the capacity necessary for the condenser varies inversely as the square of the voltage, it would be feasible to use a condenser in connection with a high-pressure transformer. To the cost of the condenser would then have to be added the cost of the transformer, but some saving might even then be effected.

Professor Walker, however, pointed out that the economy suggested is open to question, as the high voltage necessitates increasing the thickness of the dielectric in the condenser, and this causes the capacity to fall.

The Scherbius phase advancer manufactured by Brown, Boveri & Co. is in considerable use on the Continent, and gives excellent results. The overall dimensions of a set capable of bringing a 600-h.p. motor to unity power factor are 50 in. by 22 in. by 25 in., and its weight 750 lbs. Power factor curves for a 400-h.p. 32-cycle motor running at 160 r.p.m., with and without the advancer, are given in Fig. 1. The

FIG. 1.—POWER FACTOR CURVES OF 400 H.P. MOTOR. THE LOWER CURVE WITHOUT AND THE UPPER CURVE WITH SCHERBIUS PHASE ADVANCER.

winding, which is of the usual drum type, lies in holes in the laminated core. The field is produced by the armature itself and rotates at a certain slow speed. A smooth iron ring surrounds the armature to reduce magnetic reluctance. The required e.m.f. is produced by the cutting of the field by the armature conductors producing it. The generated e.m.f. is high at small loads, so that at normal loads the current is already leading. If it is required that the power factor never exceeds a certain value, the machine is designed to become saturated at this value.

The Kapp vibrator consists of an oscillatory magnet excited with a weak continuous current, and placed within a wound stator, one of which is put in series with each of the rotor phases of the motor. As the current pulsates with the frequency of the rotor slip, the magnet oscillates, and induces an e.m.f. in the stator winding. This e.m.f. is leading, and the power factor is thus improved. The "injected" e.m.f. can be controlled by adjusting the excitation of the magnet. Professor Kapp pointed out in the discussion that this machine is different from a rotary machine in that the injected e.m.f.

varies as current÷slip, instead of current alone. His vibrator is therefore better than the rotary phase advancer at light loads and for slips of small magnitude. Tests on a 25-h.p. 500-volt motor running at 1,000 r.p.m., with the vibrator, showed that at  $\frac{1}{4}$ -load the power factor was 0.82; at  $\frac{1}{2}$ -load, 0.98; at  $\frac{3}{4}$ -load, 0.94; and at full-load, 0.93. Tests are in progress with a view to the adoption of the vibrator on the three-phase traction systems in Italy, where 200,000-h.p. is in use. At 5 per cent. over synchronism, a train on test threw back power into the line to the amount of 35 per cent. at a power factor of 0.94. The suggested arrangement is shown in Fig. 2. The vibrators are in mesh connection.

FIG. 2.—PROPOSED ARRANGEMENT OF KAPP VIBRATORS ON 3-PHASE LOCOMOTIVE.

The magnetising currents from the vibrators are sufficient for machine No. II., with a little over for No. I.

The Kramer advancer is similar to the Scherbius, except that it is connected mechanically instead of electrically.

The Miles Walker machine is also similar to the Scherbius machine, with the addition of field magnets whereby commutation is improved, and it is probably the best construction for use with large motors. It is doubtful whether Scherbius advancers could be built to work sparklessly for motors of 2,000 h.p. The cases most suitable for the addition of phase-advancers are those where the motors run continuously in one direction. Large induction motor-generators, whether the continuous current load is steady or not, might be fitted with advancers.

Professor Walker gives the following as a suitable construction and design for an advancer direct-connected to an 800-h.p. 50-cycle induction motor running at 490 r.p.m., with three-phase star-wound rotor having a standstill pressure of 800 volts per phase. The working current  $Ow$  will be about 255 amperes. To find the rotor current necessary to make the motor run at 0.95 leading power-factor, the construction shown in Fig. 3 is adopted. The power-factor without the advancer will be about 0.88, equivalent to a lagging current  $wu$  equal to 47 per cent. of the working current, i.e., 120 amperes. For the rectification required, the advancer must supply to the rotor an additional 31 per cent. of leading current  $au$  making 200 amperes wattless in all. Adding as vectors, Fig. 3, the 200 amperes wattless to the 255 amperes working current, we get 324 amperes per phase for the rotor. If the rotor had a phase voltage of 400, we should have had 650 amperes, which, though more expensive, would give a possible design of advancer.

The armature is mesh connected. If the full-load slip of the motor is 1.45 per cent., the E.M.F. generated will be 20 volts between rings. Lay off as in Fig. 4 the vertical line  $OE_a$  to represent this voltage in phase A. Fig. 3 shows the angle of lead of the current on this voltage; therefore set off the line

FIG. 3.—CONSTRUCTION TO FIND ROTOR CURRENT TO GIVE A CERTAIN POWER-FACTOR.

FIG. 4.—CONSTRUCTION TO FIND VOLTAGE TO BE SUPPLIED BY ADVANCER.

$Oa$  to represent the current in phase A. Similarly  $Ob$  and  $Oc$  represent the currents in the other phases. Allow about 6 volts for pressure drop. This will be represented by  $E_a R$ . Provisionally allow about five volts for the reactive drop in the field coils of the advancer. This is represented by  $RX$ . There is no reactive drop in the armature, because the compensating winding wipes out its field. If a voltage  $XV$  is added parallel to  $ba$ ,

we shall get a resultant voltage  $OV$  in phase with  $Oa$ . Therefore excite the advancer with a current in phase with the sum of  $Oa$  and  $-Ob$  (shown by the dotted line  $ba$ ) and the current leads by the right amount. The voltage to be generated by the advancer is given by  $XV$ , which when scaled off gives us 33 volts. The projection of  $OV$  on the vertical line gives  $OV_r$ , which is greater than  $OE_r$ . If  $OV_r$  is greater than is necessary to drive the working current through the rotor circuit, the slip of the rotor will be reduced. If  $OV_r$  is not sufficient to drive the working current, then the slip will be increased. Thus the rating of the advancer is 33 volts between terminals, and 324 amperes per phase. It will be found, said Professor Walker, that the series-wound advancer will have more suitable characteristics for the case in hand than a shunt-wound or separately excited advancer. With a series excitation, the amount of leading current taken from the line increases with the load, so that the power-factor of the motor remains more nearly constant than where the excitation of the advancer remains constant. When the voltage to be generated is of the order of 30 volts or higher, and the current reasonably low, a closed armature winding is best. Theoretically, three salient poles (equivalent to two magnetic poles) are quite enough for a machine of the rating required, but six poles are more likely to fit in with standard parts. This gives six brush-arms, two in parallel in each phase. There will be 162 amperes per brush arm, and  $162 \div 1.73 = 94$  amperes per conductor. The remaining questions are of design. The armature need not differ from a continuous-current armature. The field winding will be provided with series exciting coils and compensating windings connected to the various phases in a suitable way. The main points to look to were summed up by Professor Walker as follows: (1) The six salient poles are equivalent to a 4-pole machine magnetically. (2) The voltage to be generated as a continuous-current machine is 1.41 times greater than the virtual voltage called for. (3) The fluxes in the poles are  $120^\circ$  apart in phase. The induced armature pressure per coil is only 0.86 of that which would be generated if the two poles were carrying the maximum flux at the same time. (4) The series winding on each pole must cause the flux to lead the current in the armature conductors under the pole. (5) The phases of the currents in the armature and field must be looked to when arranging the compensating winding. (6) A commutating flux should be provided. The size of armature most suitable will come out to about 46 cms. dia. and 18 cms. long.

In practice it will be found unnecessary to adjust the speed exactly. If it is necessary, however, this can be done either by changing the speed of the advancer or by diverting some of the series field current. It is more economical to drive the advancer at high speed. In the machine described, commutation is made better by giving each armature coil a span of somewhat less than the full pitch, and arranging the positions of the brushes so that one of the limbs of each coil is moving in the fringing field of a pole excited by a current at all times proportional to the current under commutation. The alternation of the current in the armature and field causes a harmful e.m.f. to be set up in each coil under commutation; but as the frequency is so very low (say one cycle per second), this e.m.f. is not sufficiently great to create any disturbance. In the machine considered, it only amounts to one-sixth of a volt.

Several cases are quoted in the Paper of machines in actual operation which are giving good results. In one case three 400-h.p. slow-speed motors for pumping water for the Port of London Authority gave a power-factor of only 0.55 until phase advancers were added, when they took a slightly leading power-factor, a rebate of 10 per cent. being allowed. In another case a 750-h.p. motor driving a rolling mill took 1,000 k.v.a. at 0.64 power-factor, which was changed to 800 k.v.a. at 0.8 power-factor when the advancer was added. Other equally good results were cited by various speakers.

Besides the points connected with design already given, several points were raised in the discussions. Professor G. Kapp, Professor S. P. Thompson, and Professor Walker all dealt with the cheapening of the cost of construction of induction motors rendered possible by the advent of the advancer, whereby more iron and less copper could be used. The cost with an advancer should not exceed the cost of an ordinary induction motor, while the power-factor would be better. Dr. S. P. Smith (Central Technical College) gave several reasons why the advancer should be put at the generating station, and not on the consumer's premises. By installing an advancer (a commutating machine), all the advantages of the induction motor were done away with, and the factor of safety reduced. The consumer paid for something he did not get. It was, he said, a fundamental fault to put in a second machine, though there would no doubt be a few cases where this course would be desirable.

Professor Kapp described the results obtained in Italy with Professor Arno's discriminating meter. It had been found that the cost of a consumer to the power company could be given by  $K_i r^2 (aEI \cos \phi + bEI) dt$ , where  $a$  may be taken as  $\frac{2}{3}$  and  $b$  as  $\frac{1}{3}$ . Working out for the case of a machine giving a power-factor 0.88 at full load, and assuming that it ran for 3,000 hours at about  $\frac{1}{2}$  load ( $\cos \phi = 0.8$ ), the meter would register 1.08 K, whereas an ordinary meter would register K. Taking the cost of the Miles Walker advancer as £170, and current at  $\frac{1}{2}$  d. per

unit, the profit would be £170, say £85 for the consumer and £85 for the company. He held that by this system, where a consumer could get 50 per cent. profit on the capital cost of an advancer, he could be easily induced to instal one himself.

Mr. W. E. Burnand has sent a long communication in which he advocates charging the wattless component at bare cost and the true watt component at cost plus profit. This is effected by adjusting the meter so that with full-load current at zero power-factor, the meter runs at about  $1/5$  full-load speed instead of standing still. For small motors up to 20 h.p., he would strengthen up the transformer of the auto-starter and have two or three running positions at different voltages; some saving is effected in a few cases, though, of course, the system is not always applicable.

**Institution of Electrical Engineers.**—The following is the result of the ballot for new members and transfers from one class to another at the meeting on Thursday:—*Graduates*: W. C. Bexay, W. Brodie, C. E. Covell, B. Drane, H. G. Furlong, L. B. Giles, F. H. Jennings, I. E. Poyser. *Students*: A. Alves, A. E. Ammar, S. G. Anderson, A. Arias, G. G. Dawson, V. G. de Ferranti, E. A. do Rio, W. O. Fenwick, G. V. Fraser, R. Gray, E. A. Guthrie, G. Haigh, A. T. Hitch, J. C. Holden, D. H. Jaques, W. W. Keen, W. H. Kerman, D. J. McCourt, G. S. Marston, A. Morales, K. V. Ramana, W. J. Rawlings, B. Rowe, O. W. Sherwell, M. Singer, E. Wolf. *Candidates transferred: Student to Associate Member*:—F. E. Windross. *Student to Graduate*:—F. Bailey, J. E. Blair, C. M. Gillies, G. E. Graham, C. B. Gresham, G. K. Loveday, F. L. Otter, N. B. Patel, G. H. Reay, N. N. Roy, A. S. Sarkaria, C. W. Saunders, G. F. Schmidt, W. C. Stewart, H. M. Theaker, C. Vandermin, H. P. Young.

**An American Opinion on Electric Restaurants.**—The following, taken from the *Electrical Review and Western Electrician* (Chicago), is interesting:—"The recognition of the future possibilities to the central station by electric cooking seems to be greater in England than in this country, in spite of the fact that we usually regard ourselves as most enterprising, and that most of the central stations in England are municipally owned." The large and increasing number of electric restaurants in London on a commercial basis is then commented on. The article continues:—"Why it is that more effort along this line is not made by the central-station companies in this country is somewhat of a mystery. . . . The usual American enterprise has not been in evidence in this particular connection, and until some persistent pioneer efforts are made to acquaint the general public in this way with the possibilities and advantages of electric cooking, we can hardly look for a very rapid introduction of the electric range."

**The Action of Electricity on Concrete.**—The results of some extensive experiments in this connection were presented at the last convention of the National Association of Cement Users in Pittsburg. A report is contained in the *Electrical World* of New York. It appears that on unreinforced concrete the only effect is a migration of the water-soluble elements. Non-reinforced concrete buildings are therefore immune from trouble due to stray earth currents. They might, however, be injured by the earthing of cables carried in conduits embedded in the concrete, since these conduits would then act as electrodes. It is recommended that waterproofing membranes should be applied to the surface of reinforced concrete in preference to adding waterproofing substances to the concrete itself as preventatives of electrolysis. Painting or otherwise coating iron with an alkali-resisting metal preservative before embedding it in concrete may serve to minimise the dangers of electrolysis, but no such coating has been found that does not prevent the formation of the bond between the concrete and iron when the concrete sets.

**Phasing out A.C. Apparatus.**—At a meeting of the Newcastle Students' Section of the Institution of Electrical Engineers on the 6th inst., Mr. J. Hacking read a Paper containing a very complete description of the various tests to be gone through to determine whether the various phases of newly-installed A.C. apparatus bear the correct relationship to one another and to the corresponding phases of other apparatus in parallel. In addition to tests on the simpler machines, tests on rotary converters, induction regulators, and direct-boost regulators are gone into in considerable detail. The author states that if a self-starting rotary is started up in the right direction from each delta in turn, it does not necessarily follow that the connections are right, as is sometimes believed. For example, it is quite conceivable that each delta would have the correct vector rotation, but that one of them might have a double crossing as compared with the other. Further, if the vectors of the two meshes exactly coincide, each will have the same vector rotation, but it is obvious that the connections will not answer. Rotaries fitted with boosters may have them connected either between the slip rings and the armature winding, or between the transformer secondary and the slip rings. In the latter case, it must be remembered that if any crossings are required to give the machine correct phase rotation, they should be made on the transformer side of the booster. If made at the slip rings, the boost on two phases will be changed over.

## "ELECTRICAL ENGINEERING" LITERARY SECTION

### NEW PUBLICATIONS

*We shall be pleased to post any of the undermentioned works to any address in the United Kingdom, Colonies, or Abroad at the prices given. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203-6 Temple Chambers, Temple Avenue, London, E.C., accompanied by a remittance.*

"Notes on the Materials of Motor-Car Construction." By A. E. Berriman. 171 pp. 11½ in. by 8½ in. 150 figures. (London: St. Martin's Publishing Co.) 5s.; abroad, 5s. 9d.

"Design of Electrical Machinery." By W. T. Ryan. Vol. III.: Alternators, Synchronous Motors, Rotary Converters. 129 pp. 9½ in. by 6 in. 103 figures. (London: Chapman & Hall, Ltd.) 6s. 6d. net; abroad, 6s. 11d.

"Hazel's Annual for 1913." Edited by H. Hall. 592 pp. 7½ in. by 5 in. (London: Hazell, Watson & Viney, Ltd.) Price 3s. 6d. net; abroad, 4s. 2d.

"The Practice of Electrical Wiring." By D. S. Munro. 248 pp. 7 in. by 4 in.; 97 figures. (London: H. Alabaster, Gatehouse & Co.) Price 3s. net; abroad, 3s. 3d.

Poems by E. L. Hill. 60 pp. 7½ in. by 4½ in. (London: Electrician Printing and Publishing Co., Ltd.) 2s. 6d. net; by post, 2s. 8d.

"The Practical Electrician's Pocket Book for 1913," edited by H. T. Crewe. 440 pp. and Diary. 5½ in. by 3½ in.; about 250 figures. (London: S. Rentell and Co., Ltd.) Cloth, 1s. net; by post, 1s. 2½d. Rexine, 1s. 6d. net; by post, 1s. 8½d.

"Der Spannungsabfall des synchronen Drehstrom-Generators bei unsymmetrischer Belastung." By L. G. Stokvis. 96 pp.; 9 in. by 6 in.; 25 figures. (Munich: R. Oldenbourg.) 4s. net; by post, 4s. 3d.

"Foundations and Machinery Fixing," by F. H. Davies. 152 pp. 6½ in. by 4½ in. 52 figures. (London: Constable & Co., Ltd.) 2s. net; by post 2s. 2d.

"Fortsschritte der Elektrotechnik," edited by K. Strecker. Part IV., 1911. 1,410 pp. 9½ in. by 6½ in. (Berlin: Julius Springer). 14s. net; by post 14s. 4d. Abroad 14s. 7d.

"Technical Electricity," by H. T. Davidge and R. W. Hutchinson. 590 pp. 7 in. by 5 in. 273 figures. (London: University Tutorial Press, Ltd.) Third edition. 5s. 6d.; abroad 6s.

"Electrical Photometry and Illumination," by H. Bohle. 222 pp. 9 in. by 6½ in. 200 figures; 35 tables. (London: Charles Griffin & Co., Ltd.) 10s. 6d. net; abroad, 11s.

### REVIEWS OF BOOKS

**The Practical Telephone Handbook.** By J. Poole. 624 pp. 7½ in. by 5 in. 535 figures. (London: Whittaker & Co.) 5th edition. 6s. net; by post, 6s. 8d.

Owing to the rapid growth of telephony in this country during recent years and the consequent continual increase in the number of telephone engineers who have had to be trained, there has been a constant demand for Mr. Poole's excellent work on the subject. This, combined with the wisdom of the publishers in limiting the size of each edition, has enabled the book to be revised and brought up to date frequently, and it is safe to prophesy that the present edition—the fifth—will be exhausted even more rapidly than its predecessors. The publishers have been able to keep the price of the book extremely low for a high-class work of this character, so that it is well within reach of every member of the telephone industry and every student.

In almost every section of the book the author has displayed due sense of proportion. He has not attempted, for instance, to describe every telephone instrument on the market, but has selected a sufficient number of typical ones. He has also resisted the temptation to make use of the diagrams of the large number of junction circuits which must be at his disposal; his treatment of this part of the subject, however, is sufficient to enable the student subsequently to tackle with confidence the most complicated circuit which he is likely to meet in practice. The same applies to party-line systems;

those chiefly in use in this country are dealt with, but the author has refrained from describing the enormous number of highly ingenious systems which have been introduced in America from time to time. Exchange apparatus and equipment, underground and overhead construction, long-distance work, and "loading," testing, automatic telephone exchanges, and wireless telephony are all well described with accuracy of language and without too elaborate detail, but on the point of accuracy we must except one name, "Peel-Conner," which is wrongly spelt.

The book is not above reproach from the typographical point of view, owing to the revision from edition to edition and the natural desire of the publishers to utilise standing type or stereotypes, but as the student obtains the benefit of this by the low cost of the book we do not think that he will complain.

**Common Battery Telephony Simplified.** By W. Atkins. 164 pp. 7½ in. by 5 in. 150 figures. (London: Electrician Printing and Publishing Co., Ltd.) 3s. net; abroad, 3s. 3d.

As an elementary book to enable those who are already acquainted with the fundamental principles of telephony to extend their knowledge to the common battery system, this publication will be of great utility. The author has, with great wisdom and moderation, employed simple diagrams to illustrate his teaching rather than complete wiring diagrams. This is particularly fortunate, as in the present volume the illustrations show a distinct falling-off in the excellence of engraving, which has usually been a prominent feature in the publications issued by the "Electrician" Co., and, if the more detailed diagrams had been employed, there might have been considerable difficulty in tracing out the connections.

**The Science of Illumination.** By L. Bloch. Translated by W. C. Clinton. 108 pp. 8½ in. by 5½ in.; 47 figures. (London: John Murray.) 6s. net; abroad, 6s. 5d.

In the space of 146 pages of text and 30 of tables it cannot be expected that the subject indicated by the principal title of this book can be adequately treated. The sub-title, "An Outline of the Principles of Artificial Lighting," better describes it, and examination shows that after the usual preliminaries, the greater part of the contents deals with street lighting. The author assumes that his readers are not only well versed in integral calculus, but that they enjoy that mode of working in cases where very elementary geometry is quite sufficient. He ignores such commonplace matters as units and standards of light and considers the description of more than one photometer to be outside the scope of his work. Fortunately, the translator has recognised that the book in its original form would be useless for engineers except as a collection of mathematical exercises, and he has added in brackets some necessary statements about units and standards, illustrated descriptions of some modern photometers and various other practical matters. Besides this, he has made some alterations and has recalculated some of the tables, giving the foot-candle values. Many very clumsily executed diagrams have been redrawn, and the book has been lifted from a pedantic essay into one which may prove to be of use to those who care to follow the methods of calculation indicated.

Like some American writers, Dr. Bloch prefers to deal with the flux of light rather than with candle-power and illumination, and this accounts for his free use of integrals. A set of diagrams and tables at the end of the book are arranged for certain typical cases, and it is claimed that these enable minimum and mean illuminations on given areas to be calculated. On page 71 he takes a lamp of 32 horizontal candle power and a given polar diagram and proceeds to calculate the candle power at 45° by an involved process utilising the tables. He uses (without explaining) the well-known mean spherical reduction factor of 0.8, but says this gives the hemispherical candle power. His result is 23, but the commonsense graphical result from the curve is obviously about 24. The translator makes some strange confusion about surface-brightness on page 102.

**The Practice of Electrical Wiring.** By D. S. Munro. 248 pp. 7 in. by 4 in. 97 figures. (London: H. Alabaster, Gatehouse & Co.) 3s. net; abroad, 3s. 3d.

It is evident that the author knows his subject well, but he makes one mistake, namely, that he assumes almost equal knowledge in the reader. In fact, the book will appeal chiefly to two classes: those who have knowledge and experience and can meet the author on equal ground, and those who are equipped with the necessary knowledge and practical training, but whose experience has been but short. The former will find much in the work with which they agree and sufficient upon which their opinions differ with those of the author to enable them to derive the same profit by its perusal as from a keen discussion on ways, means, and methods with a fellow craftsman. For the readers who lack only the experience there is a gold mine of information in the volume. But for the learners who have practical experience only and desire to be taught the theoretical and technical side of the business, or those who have received their student training, but are only beginning to take up practical work, the book cannot be so strongly recommended.

**Technical Electricity.** By H. T. Davidge and R. W. Hutchison. 590 pp. 7 in. by 5 in. 273 figures. (London: University Tutorial Press, Ltd.) Third edition. 5s. 6d.; abroad, 6s.

Many of the suggestions contained in our review (*ELECTRICAL ENGINEERING*, Vol. 5, October 14, 1909, p. 894) of the second edition of this very popular treatise have been acted upon in this, the third edition, so that now it is even more useful than formerly. The sections on incandescent lamps, accumulators, boosters, etc., have been brought quite up-to-date and are very representative, while the space devoted to testing has been considerably extended, and includes good descriptions of the principles and construction of the ohmmeter, megger, ducter, and other well-known instruments. Somewhat excessive prominence is still given to one type of flame arc lamp, but some others are mentioned. The elementary expositions of the principles of the dynamo and motor are very good. Considering the book as a whole, one may confidently recommend it to those desiring a general knowledge of the subject or those commencing its study from a practical point of view.

**Hilfsbuch für die Elektrotechnik.** By K. Strecker. 968 pp. 8 in. by 5½ in. 800 figures. (Berlin: Julius Springer.) Eighth edition. 18s. net; by post, 18s. 8d.

This is a thoroughly practical and reliable text-book covering in a very efficient manner the whole range of electrotechnics, from the first principles of electricity and magnetism to heavy power station and traction work. The various branches of electrical work and the different classes of apparatus are not, of course, dealt with in very great detail, but the author and his collaborators, including such eminent men as Drs. Arendt, Benischke, Görges, Orlich, Ritter, Seibt, and Wikander, have succeeded in presenting clearly representative types of apparatus, and in stating concisely the more important facts and figures in each section. Heavy electric traction is discussed with an unfortunate bias towards single-phase working, but, considering the limited space, the amount of information contained in this section is remarkable. Electrochemistry and electrometallurgy are dealt with in a highly interesting chapter, which includes short descriptions of the most recent electric steel furnaces, smelting furnaces, the arc furnaces employed in the electrical production of nitrates, and ozone generators. As a result of the very practical selection of matter, this volume will be of considerable use to engineers in practice, besides being an excellent text-book for students.

**Design of Electrical Machinery.** By W. T. Ryan. Vol. III. Alternators, Synchronous Motors, Rotary Converters. 129 pp. 9½ in. by 6 in.; 103 figures. (London: Chapman and Hall, Ltd.) 6s. 6d. net; abroad, 6s. 11d.

If one with a knowledge of electrical and magnetic phenomena proceeded to design an alternator or rotary-converter on the lines indicated in this book there is no doubt that a passable machine would result. Unless, however, it was required to be a machine of practically standard pressure, current and speed, it would be a piece of luck if it was anything like the cheapest or best machine possible. The author does not claim that this book deals fully with the subject, but much better use of the space could be made than by half-filling it with photographs of machines apparently from manufacturers' catalogues. The complete set of working drawings reproduced would be very useful if the

text contained some reference to them and discussed the design from a mechanical point of view, noting the stress liable to arise in the various parts and giving methods to determine them. The author is quite correct when he says that electrical machine design is an art, but it is open to much more comprehensive treatment than that meted to it here. There is one useful feature—all calculations are made in inch measure.

**The Principles of Applied Electrochemistry.** By A. J. Allmand. 547 pp. 8½ in. by 5½ in. 136 figures. (London: Edward Arnold.) 18s. net; abroad, 19s.

A few years ago there were very few books on electrochemistry, but recently there have been quite a large number, both practical and theoretical, published. The first section of the book before us deals chiefly with fundamental phenomena and the theory of the electrochemistry of aqueous solutions, and is very complete. The chapter on electromotive force is lucidly written, and another deals in detail with cathodic and anodic processes. The phenomenon of over-voltage is discussed here, but its technical importance, however, is dealt with further on. Part II. deals with the technical part of the subject, commencing with a chapter on primary cells. In Chapter XVI. we would draw attention to the description of the Edison alkaline cell, which is very clearly written. The actual technical part of the book starts with a chapter dealing with copper, silver, and gold. Theoretical considerations are first discussed, and then it is shown how theory and practice agree. This combination of theory and practice is well set out and enhances the value of the book. The work is certainly one of the most valuable which have been published in this country. We have only one slight complaint to make. In his preface, Dr. Allmand says: "To those who wish to study the subject further, I recommend, besides the books of Haber and Foerster mentioned above . . . the following," which, so far as electrochemistry is concerned, are all German, with one exception, a book which is not yet published. Surely he might have mentioned some of the numerous English and American works on the subject.

**Electroplating.** By W. R. Barclay and C. H. Hainsworth. 399 pp. 7½ in. by 5 in. 62 figures. (London: Edward Arnold.) 7s. 6d. net; abroad, 8s.

This book has primarily been written for the practical electroplater, that is, for the man who has had little or no scientific or technical training. The authors commence with a chapter on fundamental chemical principles, explaining constitution of matter, elements, compounds, chemical equations, valency, etc., all in fourteen pages—and it cannot be done. Chapter II. deals with chemical and electrochemical action. On page 16 it is hardly correct to say that pure zinc is not soluble in dilute sulphuric acid. Pure zinc dissolves much less readily than impure zinc, and, as is stated, solution takes place more readily when it is connected up with a piece of copper, both being placed in the same solution of sulphuric acid. We are afraid that the practical workshop plater will become hopelessly muddled with the chapter on electroplating when he is brought into contact with joules and calories. These introductory chapters are, as a matter of fact, quite well written, but they are not for those who have had no elementary chemical or electrical training. If the authors could be sure that the practical electroplater would first study the elements of chemistry and electricity, then Chapter I. should be dropped, and the man with his elementary training would, with careful study, be able to master the other chapters leading up to the actual practical part of the work. The working details of the practical side are well set out, and this portion of the book is of undoubted value, and there is full evidence that it is written with practical knowledge.

**Poems by E. L. Hill.** 60 pp.: 7½ in. by 4½ in. (London: Electrician Printing and Publishing Co., Ltd.) 2s. 6d. net; by post, 2s. 8d.

When first we saw a volume labelled "Poems" among the technical tomes waiting for our cruel reviewer's paper-knife, we thought that a well-known publisher had played us a practical joke; but when we noticed Mr. Hill's name modestly nestling in the corner of the cover, our frown relaxed into a smile of welcome for the work of a brother electrical engineer. We have known Mr. Hill's comic muse, and laughed with him over divers quaint conceits, but dipping into this volume reveals him to us as a poet of serious mind. The collection before us includes some thirty miscellaneous pieces and ten sonnets. It commences with an affectionate ode

addressed to his dog, whose portrait forms the frontispiece, and ranges from light shimmering reflections of childish happiness to patriotic war songs and deep musings on the undercurrent of our modern life. We are pleased to see among the sonnets one in memory of the late Dr. John Hopkinson, of whom Mr. Hill truly writes, "The world is poorer by the death of one whose work Death cannot touch."

**Der Spannungsabfall des synchronen Drehstrom-Generators bei Unsymmetrischer Belastung.** By L. G. Stokvis. 98 pp. 9 in. by 6 in. 25 figures. (Munich: R. Oldenbourg.) 4s. net; by post, 4s. 3d.

This is a thoroughly mathematical study of the reactions in an unsymmetrically loaded three-phase generator, resulting in a determination of the pressure drop under any conditions. The author divides the armature reaction into six rotating components, three synchronous and three inverse, and the phase pressure is shown to be the resultant of seven electromotive forces. A factor is deduced to express the influence of the closed field circuit on the reactance of the armature, and finally a diagram expressing the whole theory in a graphical form is developed. An experimental determination confirming the theoretically deduced figures is appended. The work will be of interest to those concerned with the special case of three-phase generators supplying groups of single-phase furnaces or single phase railways and very unsymmetrically loaded.

**Die Veranschlagung elektrischer Licht- und Kraft-Anlagen unter Benutzung Vordruckter Formulare.** By B. Jacobi. 207 pp. 9½ in. by 6½ in. (Munich: R. Oldenbourg.) 7s. net; by post 7s. 5d.

Herr Jacobi, an engineer who has had considerable experience in the design and erection of electrical installations, presents in book form a series of 20 schedules of apparatus and material required for different kinds of plant, the object of which is to enable estimates of the total installation cost to be rapidly carried out. The schedules are similar to those in such widespread use for electrical machine design, but there will be many who will doubt the wisdom of applying this method to plant installations under widely varying conditions. However, for certain classes of estimating work these schedules will undoubtedly save time and reduce the risk of omission of small items. They can be obtained separately foolscap size, and printed in copying ink on paper suitable for writing on at one halfpenny per schedule. The explanatory notes published with the smaller schedules in the book seem to be largely superfluous. The schedules cover generator, motor, transformer, motor-generator, and accumulator installations, switchgear for each kind of plant, overhead transmission lines, cable networks, distribution boards, and lighting installations.

**Die Krankheiten des Stationären Elektrischen Blei-Akkumulators.** By F. E. Kretschmar. 162 pp. 8½ in. by 5½ in. 83 figures. (München: R. Oldenbourg.) 6s. net; by post, 6s. 6d.

The author of this handbook has set out in a clear and thoroughly practical manner the fruits of a long and rich experience in the management of storage batteries of various types and under many different conditions of operation. The symptoms of disease or other trouble and methods of diagnosing and curing the various ills are clearly set forth, and many invaluable hints as to correct management for obtaining the best work out of a battery are scattered throughout the volume.

**Deutscher Kalender für Elektrotechniker, 1913,** edited by G. Dettmar. Part I., 624 pp., 6½ in. by 4 in., 235 figures. Part II., 347 pp., 6½ in. by 4 in., 154 figures. (Munich: R. Oldenbourg.) 5s. net; by post, 5s. 5d.

This electrical pocket book is unique of its kind in that it is to be found in the possession of almost every trained electrical engineer in Germany. For the present edition, which is edited by Dr. G. Dettmar, the well-known Secretary of the Verband Deutscher Elektrotechniker, every part has been thoroughly revised, and a new section added dealing with electrically-operated railway points and signals. The authorship of the various sections is a sufficient assurance of their excellence. Dr. W. Lincke is responsible for those on electricity and magnetism, and Messrs. Kleinath, Paulus, and Linke for that on instruments and electrical measurements, which is one of the most useful in the volume. Dr. J. Teichmüller adds some valuable notes on distribution systems, including cost figures for estimating. The sections on electrical machinery and apparatus, and a particularly useful summary of power-station statistics, are by the editor himself. The electrical rules, standards, and recommendations issued by the Verband Deutscher Elektrotechniker occupy a considerable portion of the volume. A supplementary volume gives a mass of condensed up-to-date information on electric traction, telegraphy, and telephony and kindred subjects, electrochemistry and electrometallurgy, and finally useful reference sections on mathematics, mechanics, and general physics.

**The Practical Electrician's Pocket Book for 1913.** Edited by H. T. Crewe. 440 pp. and diary. 5½ in. by 3½ in. About 250 figures. (London: S. Rentell and Co., Ltd.) Cloth, 1s. net; by post, 1s. 2½d. Rexine, 1s. 6d. net; by post, 1s. 8½d.

The editor of this popular annual pocket book (Mr. H. T.

Crewe) has not shirked his task of revising last year's edition and bringing it up to date for this year, and we find evidences of commendable thoroughness in this direction. There has been some condensation where advisable, and one of the principal new articles is that dealing with electric coal-cutting machinery. New matter has also appeared on sizes of cable for electric lighting, average errors of instruments, electric power requirements, power factor meters, the control of lighting circuits, wireless stations of the world, the new Home Office mining rules, &c. The size of the work has thereby been increased by over 40 pages, and in its present form it should prove of considerable utility to those employed in many branches of the electrical industry.

**The Arbitration Clause in Engineering and Building Contracts.** By E. J. Rimmer. 24 pp. 7½ in. by 5½ in. (London: Constable and Co., Ltd.) 2s. net; by post, 2s. 1d.

The insistence of many municipalities upon the insertion of a clause in their engineering and building contracts appointing their engineer arbitrator in cases of disputes has been the subject of much controversy for many years, although it is a fact that borough engineers themselves do not all take kindly to having this duty thrust upon them. It may be regarded as a product of the Town Clerk's department; but it does put a municipal officer in a somewhat invidious position at times, as although he is the servant of one of the parties to the contract, he has, nevertheless, immediately a dispute arises, to clothe himself in a mantle of impartiality with the rapidity of a quick-change artist, and is supposed to deal with the difficulty in a truly judicial manner. This book makes a few suggestions which it is hoped will lead to the adoption of a form of contract under which the employer will be free from the fear of expensive litigation and the contractor free from the fear of unfair arbitration. Some recent cases have given prominence to the inadequacy of the average arbitration clause; but the matter is such a controversial one, and the divergence of opinion so wide, that any attempt at designing a standard clause is almost foredoomed to failure. The author does not do this, but his suggestions are well worth consideration, and will no doubt be adopted in some cases.

**The Electrical Engineer's Diary, 1913.** 11½ in. by 8½ in. (London: S. Davis and Co.) 2s. 6d. net; by post 2s. 10d.

This annual work of reference now ranks as one of the regular publications of the electrical industry, and worthily so, inasmuch as it contains some most important information which is not to be obtained in any other work. Particular attention may be drawn to the list of streets in the London area in which electric supply mains are laid, which wiring contractors could only secure otherwise at the expense of much trouble. In considerable detail the application of electricity to various industries is dealt with, and figures of power and cost are given for some forty industries, in addition to domestic applications. Another section gives technical information both on electrical questions and also mechanical engineering matters allied to the use of electricity. A model specification of electrical wiring installations issued by the Electrical Contractors Association is followed by the Home Office regulations for the use of electricity in factories and workshops, and also in mines. There is, further, an exceedingly useful feature in an index to manufacturers, which has for its object the easy ascertaining of the names of makers of articles with a distinctive or trade name; and, finally, the three days to a page diary interleaved with blotting paper.

**Notes on the Materials of Motor-Car Construction.** By A. E. Berriman. 171 pp. 11½ in. by 8½ in. 150 figures. (London: St. Martin's Publishing Co.) 5s.; abroad, 5s. 9d.

Primarily, this finely illustrated work, which is by an author well known in automobile journalism, is a description of the methods, ideals, and objects of certain departments of the manufacturing works of the Daimler Co. Incidentally, however, a great deal of most interesting information is given regarding the selection and treatment of steels and other materials, and special prominence is given to micrographic study of the subject. Written in an easy style for the general reader rather than the expert, the work should arouse general interest in modern metallurgical methods as well as admiration for the complete way in which they are carried out in the particular works referred to.

**Hazell's Annual for 1913.** Edited by H. Hall. 592 pp. 7½ in. by 5 in. (London: Hazell, Watson and Viney, Ltd.) 5s. 6d. net; abroad 4s. 2d.

Once more does Hazell's Annual provide us with a connected story of the events of the past year and a guide to the questions likely to come to the fore in 1913. The index now numbers 34 pages, and there are no less than 7,000 references. There are few matters of interest, whatever one's tastes, upon which information is not given. Among the maps is one showing the position of the stations under the proposed Imperial wireless telegraph scheme, and in addition there are references to every phase of the electrical industry.

## "ELECTRICAL ENGINEERING" LIST OF SELECTED TECHNICAL BOOKS

We shall be pleased to send any of the following books to addresses in the United Kingdom at the net published prices named, unless otherwise stated. The increased price for sending abroad is also quoted after each book. All the books listed have been recommended by our editorial staff and reviewers.

Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203-206 Temple Chambers, Temple Avenue, E.C., and should be accompanied by a remittance.

Electric Traction on Railways. P. Dawson. 25s. net; abr., 26s. 4d.

### THREE-PHASE EXTENSIONS AT MARYLEBONE New Plant Ordered.

**A**N important decision was come to by the St. Marylebone Borough Council at their meeting last Thursday, when they decided to accept the tender of Maschinenfabrik Oerlikon for two 3,750-k.v.a. 6,600-volt 50-cycle (2-pole) turbo-alternators running at 3,000 r.p.m. This decision is the outcome of a report by Mr. J. F. C. Snell (whose advice was taken at the suggestion of the Council's Engineer and Manager, Mr. A. H. Seabrook), in which he recommends the adoption of a three-phase 6,600-volt system for all future extensions at the Richmond Street power-house of the Council.

Mr. Snell's report is only a preliminary one, and deals with the choice of systems, but in a full report yet to be presented, the question of the sizes of rotaries to be adopted, the high- and low-tension switchgear, three-core cables, &c., will be discussed. Further, Mr. Snell will deal fully with the financial aspect, anticipating that the London County Council will, when the matter comes before them in regard to the necessary loan, raise the question of bulk supply from some outside authority. He points out, however, that the economical production at Marylebone is such as entirely to negative any hope of getting terms for bulk supply under existing conditions which could be good enough to compare with present or future costs. Mr. Snell has also considered the alternative systems: battery extension, Diesel engines erected at the sub-stations, and finally, extension of the present 600-volt continuous current generation. None of the systems, however, in his opinion, compete with three-phase, the total cost of which under the proposed scheme will be £42,000, or only £7 per kw. installed. The tender of the Maschinenfabrik Oerlikon for one machine was so low that Mr. Snell immediately advised the Council to purchase a second set at once.

The preliminary note does not give any further technical details than those given above, and Mr. Snell's complete report will therefore be awaited with considerable interest.

### LARGE TURBO GENERATORS

**A** PAPER on this subject was read last week before the Rugby Engineering Society by Mr. J. P. Chittenden. The paper dealt with the steam side of the unit only. The author said that to obtain the best results the maximum number of stages for various types and speeds of 1,500 and 3,000 r.p.m. comes out for multi-stage simple impulse, 15 to 16 and 8 to 10; multi-stage compound impulse, 4 to 6 and 2 to 3; multi-stage pure reaction (blade couples), 70 to 80 and 40 to 50 respectively. Apart from the high economy and reliability of large units for loads such as traction, the ability of turbine plant to hold automatically momentary overloads, even up to 100 per cent., without detriment to the plant itself and with practically no loss in efficiency or increased first cost, is a very important point. As to the question of reliability, said Mr. Chittenden, there is no doubt that the steam turbine can more than hold its own with other prime-movers, and, further, it has the great advantage that even should a mishap occur, it is seldom a serious one, and temporary repairs can be executed in a very short space of time, the turbine put back on load and continue its duty without much loss in economy while awaiting replacements from the manufacturers. The paper reproduced from the technical papers descriptions of some large turbines recently constructed, and the results of efficiency tests upon them.

### A POWER STATION WEIGHBRIDGE

**T**HE provision for coal weighing found in electric supply stations is not always as perfect as it should be, and some details of a new weighbridge which has recently been installed by Messrs. W. and T. Avery (Birmingham), at the Sunderland Electricity Works, are of some interest. The erection of the self-contained machine and the alterations to the gantry which involved pulling down one section and rebuilding it with the weighbridge fixed with the rails on a level with those of the gantry, were carried out within twenty-seven hours without interfering with the coal supply.

The machine is of the three-lever type avoiding torsional strains, and the swing of the platform in the direction of the traffic minimises shock on the bearings. The machined and bolted joggle joints prevent any shifting under stress and interchangeable hardened steel wearing parts are provided. The platform is 17 ft. by 6 ft. with standard gauge rails. The pillar is of the arch pattern, and the steelyard is the ticket-printing type, which indelibly prints the weight on a ticket

at the time of weighing, both gross and tare weights being printed on the same ticket. There are no loose weights, and the steelyard is graduated to its full capacity of thirty tons by divisions of 7 lb. It is also fitted with Avery's Patent steel notched protection bar, which preserves the accuracy of the markings.

### AN ENCLOSED REVERSING SWITCH

**T**HE small drum-type reversing switch (illustrated) has been designed by the General Electric Co., Ltd., especially for the use of Witton-Kramer tools. This switch is constructed with a portable handle; its glands are arranged to serve as efficient cord grips to hold securely the incoming cables, and the fingers are renewable. The revolving drum is

ENCLOSED REVERSING SWITCH.

cast-iron, and the entire switch is rainproof. It is suitable for any motor up to 2 h.p. at 240 volts, and its dimensions are 9½ in. by 8½ in. by 5½ in. The Company has brought out several other switches for portable tool work. These are of the "push-on" and "push-off" type, in aluminium cases, and they are provided with small rollers to reduce friction to a minimum.

### WILLANS & ROBINSON

**T**HE Press were not admitted to the Annual General Meeting of Willans and Robinson, Ltd., last Thursday, but we are informed that the report and accounts for the year ended June last were adopted. As mentioned in our last issue, there had been a heavy loss on the year's trading up to June, but it was stated that larger contracts under better conditions, and at somewhat better prices, have been secured during the year, and the Company's shops are now well supplied with work. More working capital is, however, required, and the scheme for rearrangement of the capital of the Company, mentioned in our last issue, was passed. The alterations are mainly as follows: Issue of £30,000 new 6 per cent. (Class A) cum. pref. stock, with option to subscribers to take up one ls. ordinary share with each £5 allotted (this new stock to be offered in the first instance to the existing shareholders). Issue of 4 per cent. (Class B) cum. pref. stock to be allotted to existing shareholders in exchange for present shares as follows: pref. shares, £2 stock for every £5 share; ordinary shares, 2s. 6d. stock for every £1 share. (This means the writing-down of £333,330 preference shares and £66,666 ordinary shares, making a total of £399,996 to a total of £141,665.) Issue of 30,000 new ordinary ls. shares, 6,000 of which are to be reserved for subscribers of Class A and 24,000 will be subscribed by "incoming parties," whom it is proposed, as mentioned in our last issue, shall be associated with the Company. It will be seen that the existing cumulative preference shareholders will lose their arrears of dividend, and that the new preference stock created will take precedence over the stock at a lower face value which they receive in exchange for their present holding. Including the present 4 and 5 per cent. mortgage debentures, which remain unchanged and total £248,828, the revised capital will be £421,993, as against the present capital of £648,824. At a subsequent extraordinary general meeting the necessary resolutions were confirmed.

**BINDING "ELECTRICAL ENGINEERING."**—Vol. VIII. of "Electrical Engineering" (Jan.—Dec. 1912) closed with our issue of December 26th, 1912. Readers can have their volumes bound by their own bookbinder; or, they may send their numbers to THE KILOWATT PUBLISHING Co., Ltd., Temple Chambers, London, E.C., carriage paid (with the reader's name and address), and a remittance of 4s. 6d. under separate cover. The volumes will then be bound and returned carriage paid to any address in the United Kingdom, or carriage forward to the Colonies or abroad. Binding Cases (including index, but not including binding) 2s. each, or post free 2s. 4d. (Abroad 2s. 6d.) Index alone, 1d. (Post free 2d.).

## CATALOGUES, PAMPHLETS, &c., RECEIVED

**NURSERY REQUISITES, &c.**—A folder from the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.) describes the "Magnet" Convertible outfit. The set comprises flat iron, copper kettle, saucepan with china milk heater, frying-pan, special stand, and adaptor. Self-contained milk steriliser and food warmers and radiators are also listed. Other leaflets deal with the well-known toasters, and with holophane type office shades.

**METERS.**—Simplex Conduits, Ltd. (Meter and Motor Department, Garrison Lane, Birmingham), have issued a supplementary sheet relating to the electricity meters which they supply. It gives revised prices and specifications of new types, in addition to those shown in the firm's general catalogue issued last November. The testing and calibrating plant at the com-

pany's works has already been referred to in our Paper, and the company is able to quote for similar plant for supply stations or technical schools, and will furnish specifications on application. The illustration above shows the induction type of A.C. watt-hour meter, which has the following specification:—torque, 5 c.m.g.; shunt loss per 100 volts, 0.9 watt; series loss, 1 watt; weight of rotor, 20 grammes; r.p.m., 60; starting current, three-quarters per cent. of rated max.

**CARBON BRUSHES.**—Dr. Lessing's coppered carbon brushes of medium and high conductivity, of metal, graphite, bronze carbon, and a special quality for traction motors, are listed in a folder to hand from the Electrical Engineering and

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

Equipment Co., Ltd. (109-111 New Oxford Street, W.C.). In addition to these brushes, Dr. Lessing's manufactures include welding carbons, carbon electrodes, carbon battery plates, packing rings for high-speed engines and steam turbines, carbon switch contacts, &c. The company will be pleased to send particulars of any of these lines to readers who may be interested.

**ELECTRIC LIFTS.**—A very handsomely produced pamphlet with coloured frontispiece describing the "Graham" electric lift is being sent out by the lift department of Scholey and Co., Ltd. (151 Queen Victoria Street, E.C.). Very full particulars of the working of these lifts are given, aided by excellent illustrations of parts of the mechanism, and photographs of typical examples of cars are reproduced. We had the pleasure not long ago of inspecting one of the first "Graham" lifts installed in London, and an illustrated description of the system appeared in *ELECTRICAL ENGINEERING*, Vol. VIII., page 303 (June 6th, 1912). It will be remembered that among the principal features are the simplicity of the overwinding gear and the accuracy of the floor-levelling device.

**D.C. DYNAMOS, MOTORS, AND STARTERS.**—Simplex Conduits, Ltd. (113-117 Charing Cross Road, W.C.), have issued a supplementary sheet to their general catalogue dealing with D.C. dynamos, motors, starters, and regulators. The motors listed range in size from 1/100th to 20 B.H.P., and the dynamos from 0.015 to 17 kw. They have a complete line of these machines, which are made in closed ventilated, semi-enclosed, and totally enclosed patterns.

**"THE VICKERS BOOK."**—The 1912 edition of this book gives on every one of the 64 pages a fine reproduction of one of the many specialities manufactured by Vickers, Ltd. (Vickers House, Broadway, Westminster, S.W.). Besides dynamos, motors, control gear, turbines, &c., every class of locomotion is represented, from aeroplanes to warships, together with photographs of details.

**ALUMINIUM TRANSMISSION LINES.**—In this illustrated booklet the British Aluminium Co., Ltd. (109 Queen Victoria

Street, E.C.) have collated some of the more important information issued in previous leaflets and folders, and have added new matter. Particulars of existing schemes, technical points in construction, and results of sundry tests are given. A strong case is made out for the use of aluminium at the ruling prices.

**SMALL DYNAMOS AND POLISHING MOTORS.**—Leaflets from Isaria, Ltd. (208 Tower Bridge Road, S.E.) give particulars of D.C. dynamos from 20 to 200 watts, and of small polishing motors for D.C. and single or three-phase A.C. circuits. Copies of these lists may be obtained on application.

**MERCURY VAPOUR RECTIFIERS.**—A leaflet has been issued by the Westinghouse Cooper Hewitt Co., Ltd. (80 York Road, King's Cross, N.), giving particulars of their rectifiers or converters in sizes suitable for cinematograph work.

**FOOD PRESERVATION.**—The application of the Ozonair apparatus to the problems of food preservation and water purification in ice factories is described in a publication by Ozonair, Ltd. (96 Victoria Street, S.W.).

**A CONTINENTAL COURIER.**—Under this name the Great Central Railway have issued a booklet giving itineraries for sight-seeing in Hamburg and Berlin. A feature is the addition of approximately correct phonetic anglicised pronunciations of the places to be visited, and of other useful words and expressions.

## TEA MAKING BY ELECTRICITY

WE illustrate here the arrangement employed at their head office (67 Queen Victoria Street) by the General Electric Co., Ltd., for making tea for the staff. A small space in a corner of an office is occupied by the compact equipment, and the water is heated by a five-gallon electric urn of G.E.C. manufacture which boils from cold in about an hour. The urn is 11½ in. high by 14½ in. diameter, of

ELECTRIC TEA-MAKING AT THE G.E.C. OFFICES.

rolled copper, highly finished outside, heavily tinned inside, and is fitted with a large-bore tap for quick pouring; it is arranged for three circuits, so that part of the current can be utilised when the maximum 2,000 watts are not required. As boiling water is drawn from the urn, cold water may be added, so that no time need be lost to have a constant supply of boiling water for the teapots.

**A Report on the U.S.A. Patent System.**—A lengthy report on the U.S. Patent Office has been sent to Congress. It is recommended that the Commissioner of Patents be relieved from judicial work, so as to give him more time for supervision of the examining staff, whereby it is hoped to reduce the number of invalid patents issued. An important recommendation is that the life of a patent be so limited as to expire 19 years from the date of filing the application, excluding the time, not exceeding two years, during which an application may be involved in opposition. The commission reports that under the law, which allows an applicant one year in which to answer any action of the Patent Office, there have been many applications kept pending in the Patent Office for ten years or more. The commission believes that the remedy is to make the term of the patent commence from the date of filing the application, as is done in other countries. It is further recommended that an abstract of a patent be published in the *Official Gazette* instead of the first five claims of a patent, as at present.

# QUESTIONS AND ANSWERS BY PRACTICAL MEN

## RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelopes.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

## QUESTION No. 1,322.

Show the relative current values, &c., in the transformer windings, motor, and mains of two auto-transformers "V" or open-delta connected, and used for starting a 3-phase, 3-wire motor by means of 60 per cent. voltage tapplings. Also show why these transformers must have a total capacity of 115.6 per cent. when compared with 3 star-connected transformers used for the same purpose.—A. J.

(Replies must be received not later than first post, Jan. 23rd.)

## ANSWERS TO No. 1,322.

A 3-phase, 500-volt, 50-cycle system of about 1,000 k.v.a. has a power factor of about 0.7, which it is desired to improve by installing a rotary condenser. Can any of your readers tell me the smallest possible size of synchronous motor which can be put in to bring the power factor of the whole system up to 0.9? I should also like to have a method of calculating this.—Cos  $\theta$ .

The first award (10s.) is made to PHRY for the following reply, which we have slightly abbreviated:—

The rating of the machine required may be determined as follows: 1,000 k.v.a. at 500 volts 3-phase corresponds to a total current per phase of  $\frac{1,000}{500 \times \sqrt{3}} = 115.5$  amps. At 0.7 power factor the load current in phase with the volts will be  $115.5 \times 0.7 = 81$  amps., and the wattless current  $\sqrt{115.5^2 - 81^2} = 82.5$  amps. With the same load of 700 kw. at 0.9 power factor, the generators will be delivering  $700 \div 0.9 = 778$  k.v.a., or 90 amps. per phase, and the wattless current will be  $\sqrt{90^2 - 81^2} = 39$  amps. This means that the synchronous motor must supply  $82.5 - 39 = 43.5$  amps. per phase of wattless current; i.e., its rating must be  $43.5 \times 500 \times \sqrt{3} = 375$  k.v.a. The rating for any given case may readily be obtained graphically, as shown in Fig. 1, where OA

FIG. 1.

represents to scale the power load, in this case 700 kw. AB is drawn at right angles to OA, and from centre O are described arcs of radius = power load and power load  $\cos \phi$ , where  $\cos \phi$  and  $\cos \phi_1$  are the power factors before and after installing the synchronous condenser. The length BC gives the rating of the synchronous machine in k.v.a. If it is required to bring the power factor to unity, B will evidently coincide with A, and AC will be the required rating. In the case considered, the total rating is: generators, 778 k.v.a.; synchronous motor, 375 k.v.a.; total, 1,153 k.v.a. If the present generators are overloaded, it would be better policy to spend the money on

a small generating set to take part of the load and act as a standby, rather than on a synchronous condenser in the generating station, which would be useless if the main generating plant was out of commission. If, however, the generators are supplying the greater part of the load over a fairly long feeder, the case is altered. Assuming that the CR drop in the line is 10 per cent. of the generated volts, and the inductance negligible, then the received voltage will be 450, and the loss in the line 100 kw. If now the power factor at the generators is raised to 0.9 by installing a 375 k.v.a. synchronous motor at the receiving end of the line, the total current required from the generators will be 90 amps., and the drop in the line will be reduced from 50 volts to  $\frac{50 \times 90}{115.5} = 39$  volts. Thus the voltage at

the generators may be reduced to 490, and the rating of the generators will be  $90 \times 490 \times 3 = 762$  k.v.a., or, adding the rating of the synchronous motor, 1,137 k.v.a. in all. At the same time the line current is reduced from 115.5 to 90 amps., and the loss in the line from 100 kw. to 60.5 kw., a saving of nearly 40 kw., which would probably offset the prime cost of the synchronous motor, even allowing for the losses in the motor itself. Thus the increase in capacity of the generators would be clear gain. Further, it is possible that the synchronous motor could be used to drive a portion of the load, taking the place of one of the induction motors otherwise required. If this can be arranged, the rating in k.v.a. of the synchronous motor required would be  $\sqrt{W^2 + K^2}$  where W is the wattless k.v.a. required for power factor control, and  $K = \text{h.p. of load} \times 0.746 \div \text{efficiency of motor}$ . The curve in Fig. 2 gives the approximate rating in k.v.a. of synchronous motors to deliver from zero to 450 h.p., and at the same time 375 k.v.a. in wattless current. It will be seen that a considerable useful output can be obtained without materially increasing the rating. In addition to this, it should be remembered that if the synchronous motor is used to displace a large induction motor, its rating in wattless k.v.a. will be reduced, since the magnetising current formerly taken by the induction motor will be eliminated. A supply of direct current to excite the field of the synchronous motor is, of course, a necessity.

The second award (5s.) is given to J. E. R. R. for the reply given in abridged form below:—

It is not stated whether the improvement is desired in order to reduce the current in the generator or to keep the load on the generator at 1,000 k.v.a. and utilise the increase in the load component for other work; as will be seen from the diagram, Fig. 3, this will mean a big difference in the size of the condenser to be installed. The rotary condenser may take the form of a rotary converter or a synchronous motor. To run the machine simply for its leading power-factor alone is rather an extravagant method; it would be cheaper if the motor or rotary were put down as near the inductive load as possible and the driving power or D.C. supply made use of. In the diagram the existing conditions are given by the triangle ABF. AB is the apparent load, 1,000 k.v.a. AF is the load component =  $AB \cos \phi = 700$  kw. FB is the idle component =  $AB \sin \phi = 715$  k.v.a. By reducing the apparent load and keeping the true load equal to 700 kw., i.e., by making the point B more along BF, we reduce the angle  $\phi$ , or we can keep AB constant at 1,000 k.v.a., by moving it round arc BTS and increase AF. In the former case, the idle component decreases from FB to FD, or from 715 k.v.a. to 340 k.v.a. The rotary or motor will have, therefore, to deal with 375 k.v.a. Adding 10 per cent. for losses, we then require a machine of 410 k.v.a. capacity, and in the latter case the idle component decreases from FB to PT, or from 715 k.v.a. to 440 k.v.a., and the load component goes up to 890 kw. Adding 10 per cent., we therefore require a 300 k.v.a. machine. If the condenser does other useful work, we can produce BF to L, and mark off FL = BH, which will give the required reduction of wattless component. Marking off FJ = 30 kw. to represent the losses in the condenser, and joining L to P, we see that an input LP of 340 k.v.a. is taken, and LF = 275 k.v.a. is available to rectify the wattless component of the system, while PJ = 160 kw. of useful work. "Cos  $\theta$ " would be well advised to consider installing three or four induction motors fitted with phase advancers. For further information on this subject see I.E.E. Journal, Vol. 42, p. 599, and Vol. 43, p. 618. [ELECTRICAL ENGINEERING, Jan. 21st, 1909, pp. 65, 420; May 27th, 1909, p. 481, also July 25th, 1912, p. 420, and this issue.]

FIG. 3.

## ELECTRIC TRACTION NOTES

The Brighton Corporation have agreed to pay the Brighton, Hove & Preston Omnibus Co. the sum of £12,100 for their trolley omnibus powers and parliamentary expenses incurred in obtaining their Bill two years ago. This includes handing over to the Corporation sixteen electric omnibuses and a garage built specially for their accommodation.

The conclusion of the second report of the Prussian Railway Authorities on the electrification of the Berlin "Stadt-Ring & Vorortbahn" (see *ELECTRICAL ENGINEERING*, Dec. 12th, p. 696) is published in the *Elektrotechnische Zeitschrift* of Dec. 19th. It includes detail estimates of the cost of running the system in 1916 with steam and electric traction respectively, and shows that the latter will be nearly 14 per cent. lower. The system is being worked at a very heavy loss by steam, the deficit for 1916 being estimated at £694,000. With electric traction the deficit is estimated at £400,000, which figure includes interest and depreciation, so that a saving of £294,000 is estimated. The report gives no hope that this serious deficit will be converted into a profit unless an increase in traffic far in excess of that expected follows the electrification. In view of the large proportions of the whole cost taken up by the 557 expensive single-phase locomotives, it would appear that a direct-current scheme would be more successful.

At a recent meeting of the Commission appointed to deal with the traffic question in Vienna, the Government Railway Minister, Dr. F. von Forster, stated that the two financial groups interested in the electrification of the Vienna Stadtbahn, namely, the Vienna Banking group and a French Financial group, had prepared complete schemes, and that these would shortly be discussed by the Government authorities. He further stated that the traffic receipts on the system had increased during the last few years at the average rate of 10 per cent., but that increased working costs, particularly labour and salaries, prevented a similar improvement in the financial results of the railway.

The Hungarian State Railways Authorities have finally decided to postpone indefinitely the electrification of the Triest-Opicina main-line tunnel sections of their system, as the smoke nuisance, the chief reason for electrification, has, it is said, been successfully overcome by the introduction of oil-fired locomotives. It is also stated that the investigation as to the relative economy of steam and electric traction for this particular case was not favourable to the latter. The single-phase system was adopted for the basis of the calculations, and in this case also the cost of the rolling stock would be the determining factor, as the line in question is very short with comparatively heavy traffic. No figures have been published, however.

It is planned to make a change over from 6,600 volt 25 cycle single-phase to 1,200 volt D.C. working on the lines of the Pittsburg and Butler Street Railway (United States of America), in the early months of this year, says the *Electric Railway Journal* (New York). The line is about thirty-three miles long and connects at each end with 600 volt D.C. systems. The district served is thickly populated and very hilly. The present single-phase system has been working since 1907.

An Edison storage battery car has recently given very satisfactory results on the Chicago Great Western Railway. The car, says the *Electric Railway Journal* (New York), is 50 ft. long, it has two bogies, and carries four 20 h.p., 200 volt, 720 r.p.m. series motors. Two are mounted on each truck, one wheel of each axle being driven by a gear (ratio 3.5 to 1) fastened to the inside of the wheel hub. A maximum speed of 35.6 m.p.h. on the level has been attained for an energy consumption of 30.4 watt hours per ton mile. The weight of the car with batteries is about 29 tons, and the train resistance is 15.2 lbs. per ton on the level. The normal distance on one charge is about 80 miles, but 100 miles may be reached on overcharge. On a trip between Silver Lake and Jersey City, including grades both ways, the car was found to consume about 5.65 ampere hours per car mile at a voltage between 238 and 225, the air compressor requiring 0.10 ampere hour per car mile in addition.

An editorial in a recent issue of the *Electric Railway Journal* (New York), commenting on the trolley omnibus, states that it is not likely that its development in America will be large. There is so far only one such line in existence in America—near Los Angeles. The reasons given are, first, that the roads are not kept in good enough condition in America for such vehicles, and, secondly, that track rights are more readily obtained.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

### The Telephone Arbitration Award

The National Telephone Co., Ltd., were on Monday awarded £12,515,264, with costs, by the Court of the Railway and Canal Commission, as the purchase price to be paid by the Post Office for the Company's undertaking. This is about £8,000,000 less than the Company's original claim, and about £3,000,000 in excess of the Post Office offer. Comparing the award with the original claim, we find that under Headings 1 to 4, comprising the bulk of the overhead and underground plant, exchange and subscribers' equipment, the claim was for £20,264,851, depreciated to £17,631,606, whereas the award was for £13,456,016, depreciated to £10,459,796. During the case the Company amended their claim for part of this equipment (less depreciation) from £19,550,315 to £18,133,193, and the Post Office offered £12,143,865 instead of £11,617,159. Headings 5 to 12, including certain other plant, land, stores, buildings, licensed telephonic business at Portsmouth, Brighton, and Hull, the private wire business, &c., were settled out of court in the Vacation for £2,055,468. The original claim was for £3,293,094.

The sum awarded under Headings 1 to 4 included £247,189 to cover the cost of raising capital; the Company's claim for this was for £757,657. The Hon. A. E. Gathorne-Hardy concurred with Mr. Justice Lawrence's award in all particulars, while the third arbitrator, Sir James Woodhouse, agreed in all points except the allowance for the cost of raising capital, which he thought should not have been granted, but the finding of the majority of the arbitrators, of course, holds.

On the question of the allowance to be made for supervision of constructional works, the Judge said that although the evidence of Mr. F. Gill was as remarkable for the care and ability he had brought to bear on the inquiry as it was for his fairness and candour in the witness-box, his results were not completely satisfactory, as the typical period taken for this part of his estimate was one when construction was less than it had been, for the company was beginning to approach the termination of its licence, whereas the staff was not materially diminished. That tended to increase the ratio which general charges bore to construction. On the other hand, he could not adopt the percentages put forward by the Post Office. Some of their documents handed into court were very misleading, and should not have been produced.

He was surprised that the Post Office disputed that the cost of obtaining subscribers' agreements ought to be included in the valuation, and he allowed a sum for this.

With regard to depreciation, he held that the company's sinking-fund method of estimating this was a proper method to adopt in a going concern, especially where revenue is largely used for capital purposes, but it should not apply with value of plant as between a vendor and vendee. He therefore adopted the straight line method put forward by the Post Office, and took as a basis of the life of the plant the "physical" life, as contended by the company, and not the "effective" life, as contended by the Post Office; whereby they took into account probable expansion of business, obsolescence, and defective plant, &c. He held that the measure of the probable expansion of business did not enter into the calculation, and also that the assumption that the expansion would be at the same rate as in the past was not supported by any evidence other than that of hope and expectation. He did not think that there would be any great expansion unless the service were improved and rates lowered. As, however, some of the plant taken over was shown to be defective and other obsolete, he had been compelled to reduce the physical life somewhat. In this way he had allowed also for withdrawal of wayleaves, defective spare conduits in cement blocks, defective spare wires overloaded poles, and increased cost of maintenance of poles and struts in the later years of life, and absence of bonding at man-holes. The rejection of the company's method of reckoning depreciation is largely responsible for the great reductions in the total sums awarded.

According to *The Times*, it is probable that there will be an appeal on at least one point, this being on the cost of raising capital. The announcement of the award on the Stock Exchange caused a drop in the quotation of the company's deferred shares from about 138 to 109.

## The Marconi Inquiry

The most important event in connection with the inquiry into the proposed Imperial wireless telegraph scheme by the House of Commons Committee since our last issue, is the presentation of an interim report by the Committee, in which they express the opinion that steps should be taken at once for the purchase of the sites mentioned in the contract, irrespective of whether the contract is finally adopted or not. They further state that in regard to the installations, either the Government must select a particular company, or else leave themselves free to adopt or reject from time to time any system. Whichever solution is ultimately recommended, however, the Committee point out that it is in their opinion necessary for the Committee or the Government to come to a conclusion as to the technical and scientific merits of the various systems. For this purpose it is believed that the best result will be reached by the immediate appointment of a highly qualified technical committee, apparently of a permanent character, as it is suggested that this committee would be able to advise not only as to the system to be adopted in the first instance, but as to any changes of system that might from time to time be necessary. Unless this course is adopted, the Committee state that they themselves will be compelled to enter upon a scientific inquiry, for which, however, they do not feel competent, quite apart from the fact that such an inquiry would involve very considerable delay in reaching any conclusion on the other matters before the Committee. The adoption of this report, it may be mentioned, was by 9 votes to 4, one member being absent. On this report being presented by the Committee on Monday, Mr. Herbert Samuel expressed the willingness of the Government to act upon the suggestion of the Committee, but in regard to the appointment of a technical committee, suggested that a time limit should be placed upon the receipt of their report, and that, at any rate, it should not come later than the final report of the Committee. The Government, he said, would not be justified in entering into any contract for a system which had not been submitted to adequate practical tests, and the question resolved itself into what systems were in a position to submit themselves to such tests within a comparatively brief period. The Government, he added, attached importance to three things: (1) getting the stations in operation quickly; (2) having stations which can be relied upon to work day and night; (3) having complete freedom to change the system from time to time. After this statement by the Postmaster-General, the Committee adjourned and met again on Tuesday, when, however, the proceedings were private.

At this private meeting slight modifications of the interim report were made. It is now suggested that the Committee should consist of independent experts, with a chairman of judicial or administrative capacity, and that it should report within three months. Further, the Committee desire the report endorsed by Parliament before they sit again.

Major Archer-Shee, in the House of Commons on Tuesday, asked the Postmaster-General whether an offer by Messrs. Siemens Bros. & Co. to supply a Telefunken wireless equipment having a range of 2,000 miles had been made and withdrawn owing to an arrangement with the Marconi Co. Mr. Herbert Samuel said that no tender had been made. It appears that, in the course of a conversation between a representative of Messrs. Siemens and the Secretary to the Post Office, a casual question was asked as to the cost of such a station, and a figure of £23,000 was quoted for a simplex plant delivered in this country. The offer did not include erecting, and generally was not intended to meet the conditions of the Imperial scheme.

A deputation from the Northern Scottish towns waited upon the Postmaster-General on Thursday with a request for an extension of the underground telegraph and telephone system. In such places as Dundee, Aberdeen, Arbroath and Montrose, the question of communication to the North of Scotland has been the subject of much complaint by business men there for many years, but even now they have received what is

tantamount to a refusal of the Post Office to do more than exists at present. The financial aspect of the question, the Postmaster-General pointed out, prohibits any large extension of the telegraphic and telephonic facilities with the North of Scotland. Underground cables have been put completely out of the question, but the use of "phantom circuits" is being experimented with in the hope of relieving the congestion which takes place from time to time.

It is announced that the Marconi Co. have been given a contract by the Brazilian Government for the provision of large wireless telegraph stations at Rio de Janeiro, Santa Martha, Bauru and Ladairo. These stations are to form the southern nucleus of the Brazilian internal wireless telegraph scheme which was outlined at the recent Radiotelegraphic Conference in London. The complete scheme comprises thirty stations.

According to the *Zeitschrift für Schwachstromtechnik*, the German Government contemplate the laying of an additional telegraph cable to relieve the traffic between England and Germany, from Norderney to Bacton (Norfolk). A sum of 1·8 million marks has been voted for the purpose.

Telegraphic conditions remained fairly quiet during the past week. On the 8th inst. the Bangkok-Kedah line was restored, as well as that between Teheran and Meshed.—The Bonny-Duala cable was in working order again on the 9th inst., and the Fao route was down beyond Bagdad on the 10th inst.—The Ottoman Government states that messages to Smyrna and some other places are subject to delay.

## LOCAL NOTES

**Altrincham: Street Lighting.**—The local electric supply company is designing a street lighting scheme.

**Belfast: The New Power House.**—It is not probable that the Corporation will accede to the request of the recent deputations of ratepayers to postpone the construction of the proposed new power house, the erection of which was recommended by the City Electrical Engineer, Mr. T. W. Bloxam, and supported by Mr. S. L. Pearce, of Manchester, who was consulted. The proposal to defer the matter until tests of a Diesel engine have been made at Messrs. Harland & Wolff's works seems rather ridiculous, especially as it appears that the engine in question has not even been built as yet. The building of this engine, we believe, is not being entrusted to any of the three makers of Diesel engines in this country well known to our readers, but we understand it will be of the Burmeister & Wain type, a large firm of Copenhagen shipbuilders with whom Messrs. Harland & Wolff have working arrangements.

**Blackrock: Electric Lighting.**—The Council have appointed Mr. S. L. R. Price, of Pembroke, to report upon the electric lighting scheme of the Dublin & Southern District Electricity Co.

**Dublin: Salaries of Shift Engineers.**—The Corporation have passed a recommendation of the Electricity Committee to the effect that shift engineers in the Corporation electricity works should be granted a maximum salary of £200 per annum, instead of £156 as at present. The Committee expressed the view that these members of the staff are not properly paid in Dublin, and that four good men have during the past three or four years left the service to take up similar positions in India and South Africa at much better salaries.

**Dundee: Addition to Power Load.**—Another large works has adopted electrical driving. Nearly 250 h.p. has already been installed, and an additional 300 h.p. is ready for connection to the Corporation mains.

**Edinburgh: Supply in Outside Districts.**—A sub-committee is considering the general question for supplying to districts outside the Borough boundaries, with a view to applying for the necessary parliamentary powers.

**Hove: Electricity Supply.**—There is likely to be some

## "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

### Specifications Published Jan. 9, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications. Names in italics indicate communicators of inventions from abroad.

28,459/11. **Flexible Low Pressure Armoured Cables.** M. KALLMANN. Flat thin conducting strips, e.g., copper tape, insulated from, and protected by, flat metal armouring, such as steel tape, are made up into a solid thin cable by an adhesive compound, and with a maximum of flexibility. In addition to the adhesive compound, braiding may be used. Six figures.

28,486/11. **Pressure Regulation of D.C. Dynamos.** BROWN, BOVERI. The excitation is pulsatingly varied. The oscillating system to effect this consists of a single electro-magnet, excited according to the pressure of the machine, together with an oscillating armature, whose period oscillation is less than that necessary for the regulation, and a retracting spring. The damping is supplied by a short-circuited winding on the field-magnet poles. The resistance to be short-circuited by the oscillating system is in the dynamo shunt field circuit. One figure.

535/12. **Tungsten Contacts.** B.T.-H. (*G. E. Co., U.S.A.*). Wrought tungsten is used for the contacts of X-ray or cathode tubes and other apparatus subjected to high temperatures.

1,903/12. **Transmitting Power from Windmills.** W. A. JACK. Magnets are mounted on the axle, and a wound stator is mounted in the head frame. A.C. or D.C. machines may be used. Two figures.

3,055/12. **Wireless Receivers.** MARCONI's and H. J. ROUND. To avoid the results of natural electric waves, commonly known as X's, two aeriels are used, one tuned to the signals to be received, and the other slightly different. The currents set up on the latter are led to the stator of an alternator whose rotor is rotated so as to bring up the frequency to that of the other aerial, which is coupled to the oscillating circuit containing the rotor. These two X frequencies are put in opposition in a third circuit, in which is the detector. One aerial with double tune may be used. Three figures.

3,445/12. **"Call-up" Signals for Wireless.** F. L. MUIRHEAD. The signal is made by a prolonged dash to distinguish it from atmospherics or those of ordinary working. The core of an electro-magnet is kept in slow constant rotation. A contact-maker on the armature normally rests on a stop, but is moved to a contact stop when the magnet is energised, and completes a signalling circuit. To cover the distance between the stops may require the armature to be energised for 50 seconds, so that the "dash" must be of at least this duration. Three figures.

3,532/12. **Parallel Working of Rotary Converters on A.C. and D.C. Side.** B.T.-H., H. W. TAYLOR, F. P. WHITTAKER, and H. N. SPORBOG. The alternator supplying the rotary has one insulated winding for each rotary. The windings may be of different voltages and provided with tapplings, no transformers being used.

12,134/12. **Speed Regulation of Induction Motors.** BERGMANN A.G. A rotary converter is fed from the slip-rings. Direct coupled to the induction motor is a D.C. motor fed by the rotary. The field of the D.C. motor is supplied by an exciter mounted on the shaft of the rotary. Two figures.

13,602/12. **Excess Current Meter.** E. SCHUPPISSE. On constant pressure circuits an electrolytic meter is connected across a shunt in the usual way, but a constant resistance is also connected between the anode and the positive main, and another between the anode and the negative main. Until a certain current is exceeded the P.D. across the meter is not sufficient to cause it to register. One figure.

18,632/12. **Short Range Wireless.** H. HEINICKE and M. JASPER. The secondary of the oscillation circuit is connected to an oscillator with its spark gap at the focus of a parabolic mirror. The circuits are adjusted so that the higher harmonics are transmitted into space. A thermopile is used for receiver. One figure.

### Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free. Summaries of some of the more important of these patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** B.T.-H. and YOUNG [Distributing] 627/12; HOLMES and AUTOMATIC ADVERTISING CO. [Electric control of electrically-driven apparatus] 1,569/12; PATON [Fixing aerial lines to insulators] 5,636/12.

**Electrochemistry:** R. HOE & Co. and LONGEE [Blackleading machines for electrotypers] 1,968/12.

**Ignition:** BENTALL and BINGHAM [Magnetos] 5,629/12; TOWNSON [Automatic timing] 6,077/12.

**Switchgear, Fuses, and Fittings:** GIBSON [Wall plugs] 28,837/11; TURNER [Motor controllers] 29,138/11; RAILING and STRACHAN [Switches] 4,577/12; WATSON [Combined switch and plug terminals] 6,673/12; OLIVER [Time switch for lamps] 23,993/12.

**Telegraphy:** PODGOURSKEY [Signalling presence of water in ships] 8,909/12.

**Traction:** ESTLER [Trolley collectors] 5,469/12; ALBERT THODE & Co. [Electro-magnetic brakes] 18,440/12.

**Miscellaneous:** FRIED. KRUPP [Magnetic separators] 29,224/11; EDMUNDSON'S, HIGHFIELD and GRIPPER [Portable battery lamps] 29,309/11; BEVILLE [Signs used with arc lamps] 229/12; LAWTON [Drying new multiple channel conduits] 2,348/12; QUERTIER [Indicating distance, time, speed, &c.] 7,617/12; Soc. COURTAUD, G. GARNIER, GIL. [Indicating] 7,780/12; MEYER & NEUHUTTEN VERWERTHUNGES GES. [Advertising] 12,133/12.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Distributing Systems, &c.:** CIE. GÉNÉRALE RADIOTÉLÉGRAPHIQUE [Charging condensers in parallel and discharging in series] 29,375/12.

**Dynamos and Motors:** HEYLAND [Improving commutation] 29,409/12; Soc. DITE S.T.A.R., 29,522/12.

**Electrometallurgy and Electrochemistry:** ERDMANN [Production of metallic oxides for catalytic reactions] 27,718/12; HENRI, HELBRONNER and VON RECKLINGHAUSEN [Sterilisation of liquids] 28,660/12.

**Ignition:** R. BOSCH [Starting systems] 24,533/12; KETTERING, 29,091/12; [Starting systems] 29,070/12, 29,071/12; and 29,083/12.

**Telephony and Telegraphy:** KRAUSE [Production of oscillations] 28,595/12; SIEMENS & HALSKE [Subscribers telephone connections grouped according to number of calls] 28,751/12.

**Miscellaneous:** Soc. L. BLÉRIOT [Electro-magnets] 28,864/12.

### Appeal from Comptroller's Decision

20,207/11. **Spark-plugs.** H. G. LONGFORD, W. W. LONGFORD, and W. A. CLARK. An appeal against the Comptroller's decision to grant this patent has been lodged.

### Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

1,434 of January 21st, 1899. **Submarine Telegraph Relays.** S. G. BROWN. A tongue is fixed to one end of a relay circuit, and makes or breaks circuit with a rotary drum having insulated sections connected to the other end of the relay circuit. The object of the rotary drum is to reduce friction. If a varying zero is set up, a correcting current is set up in the relay through correcting segments and an auxiliary relay. The receiving instrument is short-circuited by coils of high self-induction but low-resistance. Condensers in series with the line are not required. For duplex working, the incoming current enters the shunt at its mid-point, so that it behaves as a pure resistance.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Arc Lamps:** GEB. SIEMENS [Negative electrode for search-lights] 14,847/07.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** HENLEY's and W. H. NICHOLS [Junction box for metallic covered cables] 21,167/06.

**Electrochemistry and Electrometallurgy:** H. J. WESSELS [Sterilising liquids by ozone] 20,622/04; S. O. COWPER-COLES [Manufacture of seamless iron tubes and cylinders: a coating of another metal may be given] 21,081/06 and 21,082/06.

**Switchgear, Fuses, and Fittings:** D. J. O'BRIEN and T. A. ROTTANZI [Reflector casing for tubular lamps] 20,854/05; H. W. VAN RADEN and C. B. ROBINSON [Washer to prevent corrosion of primary and secondary battery terminals] 21,043/06; A. P. LUNDBERG, G. C. LUNDBERG, and P. A. LUNDBERG [Three-pin plug and socket combined with tumbler switches] 21,590/06.

**Traction:** B. T.-H. (*G.E. Co., U.S.A.*) [Regenerative braking with A.C. series motors] 21,004/06.

**Miscellaneous:** F. KLEINSCHMIDT [Storing live fish by injections of ozone into the tanks] 20,463/03.

## SUMMARY

THE Home Office has appointed a Departmental Committee to inquire into factory and workshop lighting. (Page 46.)

IN a lecture given last week at Greenock, Dr. S. Z. de Ferranti gave a few particulars of the high temperature steam turbine on which he has been experimenting for some time. By initial and interstage superheating, he has obtained a steam consumption of 7 lb. of steam per b.h.p.-hour, and the turbine is made able to stand these high temperatures by the use of electrically-welded blading. (Page 47.)

A DESCRIPTION is given of the electric driving arrangements in a wood-working establishment, and the

general conditions of motor control for this class of work are discussed. (Page 48.)

WE describe Messrs. Eckstein, Heap & Co.'s new works, and illustrate two interesting details in their switches and fuses. (Page 49.)

WE give the reasons why the House of Commons disagreed with the House of Lords' amendments to the Sheffield Corporation Bill, and wishes to grant the Corporation full wiring powers. (Page 49.)

A NEW automatic starter is described in an illustrated article entirely. (Page 50.)

THE selection of self-contained country house lighting plant is dealt with in our "Questions and Answers" columns. (Page 51.)

THE Mercedes-Stoll system of trolley omnibuses is being installed at Aberdare, and is also to be given a trial at Bradford. Further extensions of the Dundee trolley omnibus system have been postponed for three months. The proposed London Traffic Board was discussed at the L.C.C. meeting on Tuesday. (Page 53.)

MARCONI's Wireless Telegraph Co. have asked to be released from the proposed agreement for an Imperial wireless telegraph scheme.—The use of "phantom circuits," which was mentioned by the Postmaster-General at a recent deputation concerning communication with the North of Scotland, is not likely to be found applicable on these long-distance land-lines, but on the other hand it is also suggested for a new line to be constructed between New York and San Francisco.—A legal action is proceeding in London with regard to the extended use of the Marconi system in Russia. (Page 53.)

A PATENT specification by F. Braun relating to the use of long wave-lengths in wireless so as to get round obstructions more readily, expires during the present week after a full life of fourteen years. Among the specifications published by the Patent Office on Thursday last is one by P. S. Turner, covering a controller for D.C. motors whereby shunt and series armature resistance may be inserted to obtain creeping speeds and fine speed regulation. A combined switch and plug is protected by W. E. Watson, and the B.T.H. Co. and A. P. Young have a relay for protecting generators using Tirrill regulators from the effects of violent pressure changes. (Page 54.)

OPEN type arc lamps are being changed over to flame arc lamps for street lighting in Shoreditch.—An electric kitchen to cook for 100 people has been installed at Brighton.—The Scarborough Corporation contemplate the purchase of the local electric supply company.—Complaint is made at Lowestoft of the increasing tendency of the Local Government Board to reduce loan periods.—Electrical contractors at Edinburgh are complaining of the proposal of the Corporation to seek full wiring powers.—A large scheme of electric supply is being suggested for New South Wales.—Two Ljung-

## SUMMARY

THE Home Office has appointed a Departmental Committee to inquire into factory and workshop lighting. (Page 46.)

IN a lecture given last week at Greenock, Dr. S. Z. de Ferranti gave a few particulars of the high temperature steam turbine on which he has been experimenting for some time. By initial and interstage superheating, he has obtained a steam consumption of 7 lb. of steam per b.h.p.-hour, and the turbine is made able to stand these high temperatures by the use of electrically-welded blading. (Page 47.)

A DESCRIPTION is given of the electric driving arrangements in a wood-working establishment, and the

general conditions of motor control for this class of work are discussed. (Page 48.)

WE describe Messrs. Eckstein, Heap & Co.'s new works, and illustrate two interesting details in their switches and fuses. (Page 49.)

WE give the reasons why the House of Commons disagreed with the House of Lords' amendments to the Sheffield Corporation Bill, and wishes to grant the Corporation full wiring powers. (Page 49.)

A NEW automatic starter is described in an illustrated article entirely. (Page 50.)

THE selection of self-contained country house lighting plant is dealt with in our "Questions and Answers" columns. (Page 51.)

THE Mercedes-Stoll system of trolley omnibuses is being installed at Aberdare, and is also to be given a trial at Bradford. Further extensions of the Dundee trolley omnibus system have been postponed for three months. The proposed London Traffic Board was discussed at the L.C.C. meeting on Tuesday. (Page 53.)

MARCONI's Wireless Telegraph Co. have asked to be released from the proposed agreement for an Imperial wireless telegraph scheme.—The use of "phantom circuits," which was mentioned by the Postmaster-General at a recent deputation concerning communication with the North of Scotland, is not likely to be found applicable on these long-distance land-lines, but on the other hand it is also suggested for a new line to be constructed between New York and San Francisco.—A legal action is proceeding in London with regard to the extended use of the Marconi system in Russia. (Page 53.)

A PATENT specification by F. Braun relating to the use of long wave-lengths in wireless so as to get round obstructions more readily, expires during the present week after a full life of fourteen years. Among the specifications published by the Patent Office on Thursday last is one by P. S. Turner, covering a controller for D.C. motors whereby shunt and series armature resistance may be inserted to obtain creeping speeds and fine speed regulation. A combined switch and plug is protected by W. E. Watson, and the B.T.-H. Co. and A. P. Young have a relay for protecting generators using Tirrill regulators from the effects of violent pressure changes. (Page 54.)

OPEN type arc lamps are being changed over to flame arc lamps for street lighting in Shoreditch.—An electric kitchen to cook for 100 people has been installed at Brighton.—The Scarborough Corporation contemplate the purchase of the local electric supply company.—Complaint is made at Lowestoft of the increasing tendency of the Local Government Board to reduce loan periods.—Electrical contractors at Edinburgh are complaining of the proposal of the Corporation to seek full wiring powers.—A large scheme of electric supply is being suggested for New South Wales.—Two Ljung-

strom turbines have been ordered by the North Metropolitan Electric Power Co. (Page 55.)

A 3,000 kw. turbo-alternator is to be put in at Aberdeen; the Hackney Council are to spend £21,700 upon new mains, &c.; a £13,000 loan has been sanctioned at Stepney, and £3,000 at Hammersmith; a new power station is recommended at Wallasey; a 500 kw. generating set is required at Long Eaton; a 250 kw. Diesel engine and generator at Clacton, and a scheme for the extension of the Lister Drive power station at Liverpool is under discussion. (Page 55.)

The British Thomson-Houston Co. has decided to remove its switchboard department from Rugby to Willesden.—The works of Ernest Scott & Mountain, Ltd., at Gateshead, have been purchased by C. A. Parsons & Co.—The Stearn Electric Lamp Co. has joined the Tungsten Lamp Association. (Page 56.)

### ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, JANUARY 23RD.

*Institution of Electrical Engineers.*

8 p.m. "The Use of a Large Lighting Battery in Connection with Central Station Supply," by F. H. Whysall.

FRIDAY, JANUARY 24TH.

*Physical Society.*

5 p.m. At Imperial College of Science. The agenda includes: (1) "The Electrical Conductivity and Fluidity of Strong Solutions," by W. S. Tucker; (2) "The Resistance of Electrolytes," by S. W. J. Smith and H. Moss.

*Manchester Electro-Harmonic Society.*

7.30 p.m. Smoking Concert at Albion Hotel.

*Royal Institution.*

9 p.m. Evening discourse. "Recent Advances in Scientific Steel Metallurgy," by Prof. J. O. Arnold, F.R.S.

*Association of Mining Electrical Engineers.*

East of Scotland Branch. Meeting at Dunfermline.

MONDAY, JANUARY 27TH.

*Institution of Electrical Engineers: Newcastle Students' Section.*

7.30 p.m. At Armstrong College. "The Application of Electricity to the Lighting of Residences, Business Premises, and Factories," by S. I. Ellis.

TUESDAY, JANUARY 28TH.

*Institution of Electrical Engineers: Manchester Section.*

7.30 p.m. At the University. "The Use of a Large Lighting Battery in Connection with Central Station Supply," by F. H. Whysall.

WEDNESDAY, JANUARY 29TH.

*Institution of Electrical Engineers: Students' Section.*

7.45 p.m. Victoria Embankment. "The Standardisation of a Line of Induction Motors," by E. T. Driver.

*Institution of Civil Engineers: Students' Section.*

Visit to Edgware Road-Paddington extension of the London Electric Railway.

### The London Electrical Engineers.

(TO-DAY) THURSDAY. C. Company.—Company Training, 7 to 10 p.m.

FRIDAY, JANUARY 24TH. D. Company.—Recruit Training, 7 to 10 p.m. Company Training, 7 to 10 p.m.

SATURDAY, JANUARY 25TH. A. Company.—Week-end run at Fort Coalhouse (as for D. Company last week). Headquarters open from 10 a.m. till 12 noon.

MONDAY, JANUARY 27TH. A. Company.—Recruit Training, 7 to 10 p.m. Company Training, 7 to 10 p.m.

TUESDAY, JANUARY 28TH. B. Company.—Recruit Training, 7 to 10 p.m. Company Training, 7 to 10 p.m.

THURSDAY, JANUARY 30TH. C. Company.—Company Training, 7 to 10 p.m.

FRIDAY, JANUARY 31ST. D. Company.—Recruit Training, 7 to 10 p.m.; Company Training, 7 to 10 p.m.

SATURDAY, FEBRUARY 1ST. B. Company.—Week-end run at Fort Coalhouse. Parade at Fenchurch Street Station, 8 p.m. Service dress. No arms. A. Company.—Lorry run. The Lorry Crew will parade at Headquarters at 2.30 p.m. Service dress. No arms. Headquarters open for Regimental business from 10 a.m. till 12 noon.

**Factory Lighting.**—The Home Office has appointed the following Committee to inquire and report as to the lighting of factories and workshops:—Dr. R. T. Glazebrook, F.R.S., Director of the National Physical Laboratory (Chairman); Mr. L. Gaster, Hon. Sec., Illuminating Engineering Society; Professor F. Gotch, F.R.S., Professor of Physiology, Oxford University; Mr. J. H. Parsons, Surgeon, Royal London Ophthalmic and University College Hospitals; Mr. W. C. D. Whettham, F.R.S., Lecturer in Physics; Trinity College, Cambridge, and Sir Arthur Whitelegge, K.C.B., Chief Inspector of Factories. The Secretaries are: Mr. D. R. Wilson, an Inspector of Factories, and Mr. C. C. Paterson, of the National Physical Laboratory. We regret that no representative of the electric lighting industry has been included, and we hope that the Industrial Committee of the Institution of Electrical Engineers will duly prepare evidence for the assistance of the new Home Office Committee.

According to the "Daily Telegraph," it is anticipated that by next year telephonic communication will be established between New York and San Francisco, a distance of 3,360 miles. Our contemporary adds: "This will be possible by the use of 'loaded phantoms' placed at regular intervals along the line, through which the current, in passing, gains strength." The above is our artist's conception of the loaded phantoms.

## THE NEW FERRANTI TURBINE

Seven Pounds of Steam per b.h.p.-hour

IT has been known for some time that Dr. S. Z. de Ferranti has been working on the construction of a new form of steam turbine, and the indications which he gave in the course of his "Watt" anniversary lecture at the Greenock Philosophical Society of the trend of his researches are of great interest.

After some historical notes on prime movers in general, the lecturer took up the general characteristics of the internal combustion engine and the steam turbine, emphasising the view that as the turbine became larger it was easier to construct and more economical, whereas as the gas or oil engine became larger, the difficulties increased. It was clear, he said, that for small powers the internal combustion reciprocating engine was in every way the best, but at the other end of the scale the turbine was the only means of filling requirements to-day. He had some hard words for those who were developing the Diesel engine for marine purposes.

The way to obtain increased economy with the steam turbine was to raise the working temperatures. He had now, after years of experiment, produced a turbine which at the highest temperatures and with great and rapid variations of temperature was quite free from mechanical troubles, ran with a blade clearance so small as to be negligible as regards leakage loss, and the fear of the possibility of stripping appeared to have been effectively removed.

"In this turbine," continued the lecturer, "I superheat the steam initially, and after the first expansion, and whilst it is still superheated, resuperheat it before it does its work in the second stage of the turbine. After this, it is exhausted in a superheated condition through a regenerator to the condenser. The whole of the blading is electrically welded so as to avoid the straining due to caulking at the high temperatures that are reached, and also the loosening that occurs due to the same cause. The blading is formed of mild steel, with a thin coating of pure sheet nickel elec-

trically welded on to the surface. The blading is most accurately finished to shape by a process of step-by-step pressing under very heavy pressure. The blading, the sections of which are very exact, is welded in position with the accuracy of the automatic machine that is used for the purpose, and every opportunity is thus given for realising the best results. Although the turbine is of the reaction type, no balance dummy is used. The whole of the end load is taken on a specially constructed thrust, thus saving steam leakage. The steam is worked as a gas at high temperature throughout the turbine, and this, coupled with the many improvements above referred to, has given very good results.

"The 5,000-h.p. machine has now been running for some time, and when tested at a load of two-thirds full power has given a shaft h.p. on 7 lb. of steam per hour which, if supplied by an oil-fired boiler superheater system of 85 per cent. efficiency (this has already been exceeded in central station practice), would consume less than 0.625 lb. of oil per shaft h.p.-hour. From many tests already made it appears that when this turbine is run at full load under favourable conditions it will take less than 6 lb. of steam per shaft h.p.-hour, and that the system under the conditions named will have a thermal efficiency of over 24 per cent. corresponding to an oil consumption of about 0.55 lb. of oil per shaft h.p.-hour. The tests are being proceeded with, but as the turbine is run continuously in supplying power to a large works with a constantly varying load, it is not easy to do what is necessary to enable tests to be carried out. So far as I can see, this system when applied on a large scale will be capable of giving an overall thermal efficiency of 29 per cent."

Dr. Ferranti was enthusiastic on the future possibilities of the high temperature steam turbine. With such a machine generating electricity to supply power for all purposes on land, one had the advantage of a machine of the highest efficiency, which was not limited to oil for its fuel. He looked forward to the time when the whole of the coal used for firing these large units would be gasified, and the bye-products recovered, producing an ample supply of fertiliser for the land, a great quantity of tar oil suitable for naval firing purposes, and benzol for small motor requirements. This, he thought, was the realisation of the fuel problem rather than the production of alcohol on a large scale. The electric motor supplied from very large power stations was displacing all forms of small engines, and it was probable that in the future small prime movers would only be required to propel cars and boats, and that all stationary motors would be electric.

## ELECTRIC DRIVE IN A WOODWORKING YARD

THE application of electrical power did not, perhaps, make such early strides in the woodworking industry as in some other directions. It is suggested that this is partly due to the fact that in this class of work the waste products can produce all the power required, and proprietors have looked only for a decreased power bill, but have been unaware how electrical power would enable them to improve and quicken their processes, increase outputs, and reduce labour bills. Again, the waste products of woodworking factories have latterly become the raw material of other industries, with the result that they may be sold at a price considerably in excess of their value as fuel. Owners have thus been induced in many cases to consider other sources of energy, and where there is a public electrical supply available very advantageous terms can usually be arranged. But even when no public source of energy is at hand, the advantages of electric driving in efficiency of transmission and convenience of control are sufficient to warrant its adoption. Not only is there saving

VIEW SHOWING 30 H.P. MOTOR AND CONTROL PANEL.

in the cost of shafting and gearing, and the increased convenience of its absence, but important economies result from the more accurate control, which renders more easy and speeds up all the processes, and also from the ability to place each machine in the position where it will be most useful, instead of having to place it where it can be attached to the shafting which is to drive it.

To secure these advantages it is essential that the control gear should be suitable for the work to be done. Woodworking machines are very diverse in their characteristics. In nearly all cases the load is a very fluctuating one, while there is always the liability of sudden overloads. Gradual starting is a necessity, owing to their very high working speed and heavy starting load, as in four-cutter, planing, and moulding machines, and it is equally necessary to be able to stop immediately in cases of emergency even before the machine has been fully accelerated. The switchgear should be simple to manipulate and the operations of starting and stopping should be so easy that the workman need not take his eyes from his work to look at the controller. The motor must be protected against damage from failure of voltage or from overloads, and the switchgear must be capable of frequently opening circuit on the occurrence of dangerous overloads, without itself sustaining damage. It is also advisable to enclose the switchgear completely in one substantial housing, as the atmosphere is always more or less charged with dust.

A conspicuous example of what may be achieved by a well-planned installation, embodying the most suitable form of control, is afforded by Messrs. Latham's Lea Valley Mills, of which a description has been sent us by the Adams Manufacturing Co., Ltd. (London and Bedford). The whole lay-out was arranged by the engineers of the Hackney Borough Council's Electricity Installation and Sales Department. The total horsepower at present installed is 280, and the voltage 240 and 480 d.c. The largest unit is 50 h.p., and the smallest 2 h.p. All the motors are shunt-wound, fitted with interpoles, and of the enclosed ventilated type, by Messrs. J. H. Holmes & Co. (Newcastle-on-Tyne). One 50-h.p. motor drives a line of shafting, which drives four 36-in. circular saw-benches. The second 50-h.p. motor drives two log frames of the vertical reciprocating type, by Messrs. Robinson, of Rochdale, each machine being capable of making any number of vertical cuts up to 24 simultaneously from logs up to 30 in. square and 12 ft. long. One 15-h.p. motor drives a log-frame saw of the horizontal reciprocating type, by Messrs. J. Pickle & Son, of Hebden Bridge, which is capable of making one cut up to 48 in., cutting at the rate of 2 in. per minute. Four 30-h.p. motors each drive a length of shafting, from which various moulding and planing machines, vertical spindles, circular saws, and band saws are driven. Other smaller machines are fixed for working saw-sharpening tools, &c.

The control panels are all made by the Adams Manufacturing Co., and are of the "Adams Igranite Conspepe" type, similar to the one seen in the illustration. Each panel is enclosed in an iron housing of pillar form to exclude the dust.

In individual driving it is even more essential than in group driving to provide means for rendering sudden overloads harmless, because in individual driving the motor has only power sufficient for the one machine that it drives, and no assistance is available from flywheels or countershaft pulleys, while the amount of kinetic energy stored in the moving parts of the machine and the motor is small. Automatic stopping under an overload imposes a heavy duty upon the control gear, and the most satisfactory method of breaking a large overload current is to remove the actual break from the contacts of the starter altogether, and allow it to take place on a specially designed circuit breaker, which should be fitted with a powerful magnetic blow-out and carbon contacts. This method of breaking circuit is of special importance in a wood-working shop, where the blowing of an improperly protected fuse might lead to a fire. The fuses are not relied on to deal with overloads, and the Engineer of the Hackney Borough Council has stated that since this plant was installed over six months ago not a single fuse has been replaced.

In the "Conspepe" controllers the circuit breakers are self-resetting. They have no handle, the whole operation is entirely automatic, and no further attention is required to re-start the motor after being stopped by an overload than simply to reduce the load to safe dimensions, and start again in the ordinary way. Should any unforeseen adverse circumstances develop during starting, it should be possible to stop the motor by simply releasing or bringing back the starting handle. The panels are arranged so that a backward movement of the starter handle immediately stops the motor by opening the circuit breaker, thereby making the contacts dead, and protecting them against sparking and burning. The panels have the great advantage of having only one handle, so that there is no possibility of the various operations being performed in improper sequence. The circuit breaker and starter are so interlocked that the first movement of the starter handle in the direction for starting causes the circuit breaker to close automatically, and should an overload occur, either through too rapid starting or from any other cause, it will re-open, and no effort on the part of the operator will avail to keep it closed until the load is lightened. Furthermore, having opened, the circuit breaker will not close again until all the starting resistance has been re-inserted. The circuit breaker is so interlocked with the starter that the slightest backward movement of the handle, either from the first, or last, or any intermediate contact, causes the circuit breaker to immediately open, and so confines the duty of opening circuit always to the circuit breaker, thus preventing the starting contacts being burned or damaged. This is a valuable feature, particularly in connection with woodworking machinery. Each panel is provided with a stopping button at the side of the housing, arranged to open the circuit breaker, not to short-circuit the no-volt spools. This feature makes the panels equally suitable for stopping the machines as for starting them, as the main circuit is never broken on the starter contacts. Any number of these buttons may be fitted round the various machines, thus placing them entirely under the control of the workmen, so that the machine can be stopped immediately on emergency from any position.

We are indebted to Messrs. Latham & Co. for permission to publish the photograph, and for the particulars of the wood-working machines.

**I.E.E. Students' Section.**—Mr. G. W. P. Page (24 The Ridgeway, Enfield), has been elected honorary secretary of the Students' Section of the Institution of Electrical Engineers in place of Mr. J. Mould, who finds himself unable longer to devote adequate time to the office.

## ECKSTEIN, HEAP &amp; CO.'S NEW WORKS

WE announced in our last issue the registration of the firm of Eckstein, Heap & Co., Ltd., as a limited company. The Company has recently opened its new works, the Lancashire Switchgear Works, in Caroline Street, Broughton, Manchester, and is as active as ever under the same management. Mr. Eckstein is Managing Director and Chairman, and the other Directors are Mr. Hamer, Mr. D. B. Mellish and Mr. P. B. Hall, the two latter continuing as Managers. Mr. Heap left the firm some time ago to take up consulting work. It was in order to take in additional capital to cope with the increasing work that it was thought desirable to transform the business into a limited company.

The new works are well and conveniently arranged, the offices are roomy and comfortable, and the drawing office is large and well lighted. To facilitate the giving-out of material the stores are arranged in three floors; finished work is stored on the top floor, and on the ground and first floors are kept chiefly the stores required for the particular shops on the same level. The ground floor of the works is devoted to the machine shops, the assembling of mining switchgear units, and the switchboard shop; on the first floor are the oil-switch fitting shop, the inspection and test-rooms, the coil-winding shop, and the vacuum drying oven; and on the second floor the pattern, woodworking, enamelling, instrument fitting and circuit-breaker fitting shops.

Included among the work which we saw in process of construction during a recent visit were some 4,000-ampere A.C. oil-switches for low voltage furnace work. The solid construction and easy and sharp working of these was particularly worthy of note, and also the interchangeability of parts.

FIG. 1.—CONSTRUCTION OF FUSE CONTACTS.

FIG. 2.—CONSTRUCTION OF OIL SWITCH CONTACTS.

A standard form of fixed contact is employed, made up of a number of contact pieces, as illustrated above (Fig. 2). These are of identical pattern in most of the switches made by the firm, and are consequently absolutely interchangeable and easily replaceable. In the switches in question each row of these contacts for each phase contains three sets of 60. The construction is clearly indicated in the illustration, and the fixing of the steel spring to the waved copper strips and contact pieces is such that it should be practically impossible for anything to work loose. The contact bars are V-shaped and of drawn copper, and are actuated by a double toggle gear, and, of course, the switches are of the "free-handle" type, with no-voltage release, which can also be operated by a trip at the side of the switch.

Some reverse-current circuit breakers of very large capacity were also under construction.

An important part of the firm's manufactures is the construction of starters for A.C. motors, more particularly auto-transformer and star-mesh starters, which are made both with and without automatic devices. In all cases, however, the controlling switch is of the barrel type immersed in oil, and the transformers themselves may be either oil immersed or not as desired. In all designs the handle mechanism is so arranged that the starter cannot be put into the running position without first having been put into the starting position.

Among the other details we noticed was the design employed for the fixed contacts of fuses and certain classes of knife switches. The copper springs are bent round a piece of iron, as seen in Fig. 1, which, while allowing sufficient play, prevents the springs from getting a permanent set away from the blades after constant use.

The testing department contains three sets of motor-generators, a battery of secondary cells, and the necessary transformer equipment, enabling tests to be made up to 30,000 volts and 4,000 amperes, and there is also the requisite equipment for instrument calibration. For testing the heavier switches in the actual place in the shop where the gear is made up, two portable trolleys are being made, each containing the necessary transformers and gear, and they will be connected up with plugs as required at various points in the fitting shops, at which the current will be obtained at comparatively low pressure. One of these will be for pressure tests up to 40,000 volts, and the other for current tests up to 3,000 amperes.

There is no doubt that the works are well equipped for turning out apparatus of a very high class with rapidity, precision and economy.

## MUNICIPAL WIRING AT SHEFFIELD

THE House of Commons have published their reasons for disagreeing with the Lords' Amendments to the Sheffield Corporation Bill. When the Bill was originally before the House of Commons Committee in June the Corporation were granted full wiring powers, but the House of Lords Committee amended the Bill so as only to permit wiring and fitting work through a contractor. The House of Commons disagreed with this amendment, and their reasons are now published as an official paper:

In 1898 the Sheffield Corporation received Parliamentary sanction for purchasing this electricity undertaking. The price included for the wiring and fittings business was £13,344, and further capital to the extent of upwards of £7,000, borrowed with the sanction of the Local Government Board, has since been invested in it. In developing the business, the Corporation believed themselves to have the necessary powers until the beginning of this year, when the Courts decided otherwise, notwithstanding proceedings pending since 1906. There is only one electrical contractor in Sheffield who commenced business before the wiring department was established, and only fifteen who commenced business prior to the acquisition of the business by the Corporation. The business has never been a charge upon the rates, but has contributed towards the other portion of the electricity undertaking. The Committee of the House of Commons, after hearing opponents, gave most anxious attention to the principle embodied in the "model" clause, of avoiding municipal trading, but thought that this was an exceptional case which might be allowed.

At present the Bill is before the House of Lords, for their approval or otherwise of the House of Commons amendments.

**Lectures on Illuminating Engineering.**—A course of lectures on illuminating engineering is being held at the Regent Street Polytechnic on Fridays at 7.30 p.m. The remaining five of the course, commencing January 24th, will be by Mr. J. S. Dow, and will deal with photometry, colour, shades and reflectors and indoor and outdoor illumination generally. The fee for each lecture is two shillings.

**The Electrical Trades Benevolent Institution.**—A very successful whist drive was held by this institution on January 17th at Slater's Restaurant, 50 Cannon Street, E.C. This was organised by the staffs of the General Electric Co., the Sterling Telephone & Electric Co., and the Union Electric Co. 128 players were present, and Mr. Crow (Sterling Telephone Co.) acted as M.C. The prize fund was subscribed to by the General Electric Co., Mr. G. Burney, Mr. Justus Eck, and Mr. F. B. O. Hawes, and the prizes were given by Mrs. Ritchie. After the interval a short address was given by the secretary outlining the aims, objects and methods of working of the Institution.

**Electric Power in Norway.**—According to the *Electrotechnische Zeitschrift* there were in Norway, at the end of the official year, 1911-12, 1,230 electric generating stations, aggregating 417,607 kw. Of this amount 211,131 kw. is employed for electrochemical and electrometallurgical purposes, 126,568 kw. for mechanical, including electric traction, and the remainder for lighting and miscellaneous purposes. The lamps installed totalled to over 986,000 kw.

**BINDING "ELECTRICAL ENGINEERING."**—Vol. VIII. of "Electrical Engineering" (Jan.—Dec. 1912) closed with our issue of December 26th, 1912. Readers can have their volumes bound by their own bookbinder; or, they may send their numbers to THE KILOWATT PUBLISHING CO., LTD., Temple Chambers, London, E.C., carriage paid (with the reader's name and address), and a remittance of 4s. 6d. under separate cover. The volumes will then be bound and returned carriage paid to any address in the United Kingdom, or carriage forward to the Colonies or abroad. Binding Cases (including index, but not including binding) 2s. each, or post free 2s. 4d. (Abroad 2s. 6d.) Index alone, 1d. (Post free 2d.).

## THE PRESCOT AUTOMATIC STARTER

A NEW form of motor-starter, which cuts out the resistance automatically after the main switch is closed, independently of all external influences, has just been put on the market by British Insulated & Helsby Cables, Ltd. These are made in sizes suitable for controlling direct-current motors up to 50-amperes capacity and for pressures up to 500 volts. The arrangement essentially forms a complete motor-starter, and includes a D.P. main switch, overload and no-voltage cut-out, the latter being arranged to operate should any interruption take place either in the supply current or the motor field circuit. The apparatus, with the

FIG. 1.—PRESCOT AUTOMATIC STARTER WITH COVER REMOVED.

cover removed, is shown in Fig. 1, while the diagram of connections in Fig. 2 will enable its action to be followed more readily.

The automatic system comprises a high-resistance solenoid connected across the motor armature and operating a soft iron plunger, which under normal conditions floats upon a column of mercury. On closing the main switch the armature commences to rotate, creating a back e.m.f. which correspondingly energises the controlling solenoid, thus depressing the plunger and displacing the mercury which flows into the contact chamber and consecutively short-circuits the resistance units. The displacement of the mercury is automatically regulated

FIG. 2.—DIAGRAM OF CONNECTIONS.

by the back e.m.f. of the motor armature, the greatest displacement taking place when the motor has attained maximum speed and fully established the back e.m.f. On interrupting the main circuit, the solenoid is put out of action, thus causing the mercury to sink to its original level and re-insert the full resistance in the motor circuit. The starter has been so arranged that the resistance contacts do not break circuit, interruption of the current being made by opening the main switch. The starting current is maintained constant throughout the whole time the switch is in operation, and on account of the automatic action it is impossible for a sudden or excessive rush of current to occur.

The apparatus, in addition to securing the benefit of fully automatic action, has automatic releases which are free to open either during the starting period or afterwards. Again, the multiplicity of the resistance steps diminishes liability to sparking, and as the mercury is enclosed, no adjustment is necessary. Further, the current is maintained practically constant during the starting period and all sudden rushes of current are avoided.

## SWITCH AND LAMP CIRCUIT DEMONSTRATION APPARATUS

WE have received from Messrs. A. P. Lundberg and Sons (477 to 487 Liverpool Road, Islington, N.) a description, written by Mr. W. Perren Maycock, of a handily arranged set which has been devised to facilitate demonstration of the possibilities of the various systems of lamp control for the provision of apparatus for which Messrs. Lundberg's name is famous. Unlike the series of demonstration boards which the firm produced a little while back, the connection between the various lamp holders, switches, &c., are not permanent but are made by lengths of double- or triple-core flexibles provided with multiple pin connectors, so that each group of lamps or switches is on a separate board. Thus with one set of apparatus any desired combination may be made. The switches include the two-way, intermediate, "twinob" patterns, &c., and from a total of seven lamp-boards, eighteen switch items, and twelve flexibles, no less than twenty-four different kinds of circuits can be made up. Interesting examples are what are known as "master-switch controls," where a master switch can have one or sometimes two of the following functions:—To prevent lights being turned out at the other switches; to prevent lights being turned on at the other switches; to vary the number of lights in use. This demonstration apparatus is intended not only for lecturers on electric lighting and wiring, but also for the contractor's showroom, where it should greatly assist in spreading the use of many arrangements of wiring, the convenience of which would be much appreciated by consumers. Messrs. Lundberg are prepared to make up sets covering any group of circuits selected from their book on electric lighting connections.

## TABLE COOKING BY ELECTRICITY

THIS is the title of an attractive little booklet, the issue of which is a part of the vigorous campaign towards the popularisation of electrical methods being prosecuted by the General Electric Co., Ltd. (67 Queen Victoria Street). The booklet was, as we noted briefly at the time, issued just before Christmas, and shows well the rapid manner in which the company are developing this side of their business, and studying the requirements of the trade and the public by preparing combinations of apparatus at prices suitable to the pocket of every class of consumer. Notwithstanding the fact that most of the apparatus is of recent introduction, there is nothing experimental in any of the appliances, and their proved reliability goes hand in hand with an absence of crudeness in external design, forming further evidence of the result of steady development.

The collection dealt with in this particular booklet is devoted entirely to apparatus for use on the table, a large proportion of which has already been illustrated in our columns. First and foremost are two patterns of electric toaster, while following this is the "Just-for-two" cooker, which can boil, broil, fry, or toast, and the rather larger breakfast cooker, already illustrated and described in *ELECTRICAL ENGINEERING*, Nov. 28th, page 666, and October 10th, page 560, respectively. Another cheap and useful appliance is the "toaster hot-plate" shown on page 621 of our issue of Nov. 7th. A rather more powerful 6-in., 600-watt hot-plate, for boiling only, is also listed under the name of the "Magnet" hot-plate. A more ambitious combination set, embodying a coffee percolator, a chafing dish, and other utensils, which can be heated by the same element, is that described in *ELECTRICAL ENGINEERING*, Sept. 15th (page 500), and a breakfast set of rather different design, including a special egg boiler and a neat, small, square kettle, is that which we illustrated on Oct. 24th (page 584). The series is continued by the excellent "tea-ball" teapot and the coffee percolator, dealt with in an illustrated article on Aug. 29th (page 482), and the design of kettle with interchangeable heater depicted on page 517 of our issue of Sept. 19th. An ingenious and economical combination, in which an electric iron turned upside down is made to heat a kettle, saucepan, or frying pan, is also included. Two sizes of the "Magnet" iron (see *ELECTRICAL ENGINEERING*, Sept. 19th, page 518) are dealt with separately, and a handy miniature immersion heater is another item. Various accessories complete the list, which will be welcomed by contractors, consumers, and supply authorities.

**Lectures on Municipal Engineering.**—Professor S. M. Dixon, Professor of Civil Engineering in the University of Birmingham, has accepted an invitation to give a special course of lectures in municipal engineering at University College during the current term. The course will begin on Tuesday, January 21st, at 4 p.m.

**The "Northampton" Past Day-Students' Association.**—A very enjoyable smoking concert, under the chairmanship of Mr. S. M. Hills, was held on Friday last at the Cannon Street Hotel. There was a good attendance, and the various items, largely contributed by Old Students, and the annual topical song, composed and sung by Mr. E. L. M. Emtage, were much appreciated.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelopes.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,323.

Describe the best starting arrangement for the Latour-Winter-Eichberg single-phase commutator motor, using an autotransformer, so as to obtain the best distribution of current in the rotor and stator to give the maximum starting torque with the minimum K.V.A. taken from the mains. How does the design of the motor affect the adjustments of the apparatus?

(Replies must be received not later than first post, Jan. 30th.)

### ANSWERS TO No. 1,321.

A private self-contained installation is required for supplying about fifty 16-c.p. lamps in a private house, in which possibly two or three radiators and other miscellaneous domestic appliances may be required later. The plant is to be placed in a shed or outhouse to be built near the house. The generating plant is to run only a few hours each evening, and cells are to take the intermittent demand. State, with reasons, what plant you consider the most suitable, whether petrol, oil, gas, or steam driven, the most suitable voltage to adopt, and give comparative estimates of cost. Details of wiring not required. Replies not to exceed 1,000 words in length.

The first award (10s.) is given to "X" for the following reply:—

The question is somewhat vague, as it does not state whether the lamps are to be of the metallic filament type, or the number

FIG. 1.

of heating and domestic appliances to be installed. It will be assumed for the purpose of this question that metallic filament lamps are to be used with, say, two radiators of 1 kw. each, and provision made for 2 kw. for other domestic purposes, making a total of 5 kw. in all. As a battery is to be installed, it will be sufficient to allow for a capacity capable of dealing with half the load for, say, 6 to 9 hours, seeing that it is proposed to run the engine each evening, and with suitable switching

arrangements the dynamo can be run in parallel with the battery on special occasions of heavy demand. Owing to the use of radiators and domestic appliances, the most suitable voltage for an installation of this size will be 100 volts d.c. The battery required will therefore consist of 53 7-plate cells having 180 amp. hour capacity, the charging current for which will be 18 amps. (see D.P. Battery List). The dynamo will be shunt wound, designed to give 140 volts  $\times$  18 amps. mounted on slide rails and running at a speed of about 1,100 r.p.m. (if belt-driven). A suitable shunt resistance which will be required for regulating the voltage. The horse-power of engine required to drive the dynamo will be approximately 4.5 b.h.p., taking into account all losses. The nearest standard size will doubtless be 5 b.h.p. If space is an object a direct-coupled set can be obtained at a slightly increased cost, the dynamo in which case would be of the slow-speed type.

The question desires four types of engine to be discussed. Steam, for this size of installation, can be put out of court at once, owing to the initial outlay, space required, and upkeep cost. If the residence is close to a gas main, and the charge for gas does not exceed 2s. 6d. per 1,000 cubic feet, it might be advisable to consider this type of prime mover in preference to oil or petrol. However, if it is a country residence, the choice most probably lies between oil and petrol. Good engines can now be obtained which start with petrol and afterwards run with paraffin. With regard to the oil engine, working on Russoline oil, the consumption of oil works out from  $\frac{1}{4}$  to 1 pint per b.h.p. hour, and it would appear that this type of engine would be the most suitable type to adopt, as the engine is easily managed and requires less attention than other types. The makers generally send out a sketch giving the lay-out of foundations, piping, &c. It is, however, well to keep in mind that the water-cooling tank should have a capacity equal to 62 gallons of cooling water per b.h.p. In the pipe arrangement, means must be arranged for emptying the cylinder jacket of water in frosty weather.

The battery room should preferably be separate from the engine room, having its own entrance door. Care should be taken to ventilate it; especially is this necessary when the cells commence to gas freely towards end of charge. The cells should be mounted on wood or brick piers. If wood, these should be painted with anti-sulphuric enamel. For compactness the cells may be mounted in two tiers, in which case ample headroom should be provided for taking out plate sections for inspection, &c. In this instance 8 ft. to 8 ft. 6 in. should be the height of room. The switchboard should be arranged with suitable switches and instruments, to provide for charging and discharging simultaneously. A cut in and out automatic switch should be provided, together with a six-way charge and discharge regulating switch, to which are connected the end regulating cells. With a 53-cell battery, the regulating cells should be Nos. 53, 52, 50, 46, 43, and 39. This arrangement will be found to give ample range of voltage regulation during charge.

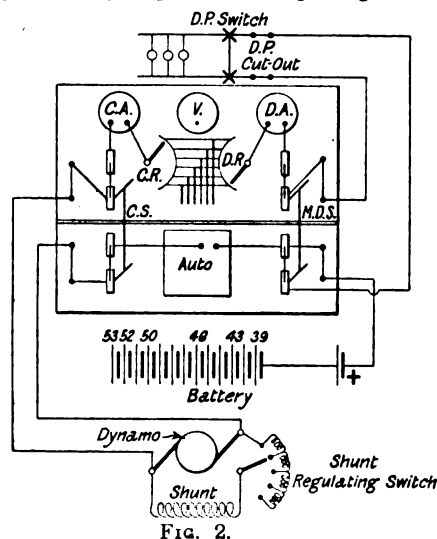

FIG. 2.

The sketches reproduced show the switchboard connections and also general arrangement of engine house. The mains from dynamo to switchboard should be run in iron pipes, and be rubber-covered and vulcanised, 7/16 size. The discharge mains from board to house should carry two-thirds the total load. These will be found to be 19/18 size, and should be lead-covered and armoured for laying direct in the ground. In general the engine house should be at least 60 yards from the house, so as

to avoid any possibility of smell or vibration, and with an oil engine it is advisable to take the exhaust pipe into a brick pit outside engine room from which is led a 9-in. earthenware pipe to 60 yards further away. With regard to the comparative costs, a plant of this size would cost £180 approximately for an oil engine, or £160 approximately for a gas engine.

The second award (5s.) is made to V. F. Bush, who writes as follows:—

The most suitable plant to adopt could only be definitely answered by a knowledge of the district in which it is proposed to install it, and of the price of oil or coal delivered to the house, or whether low generating costs could be sacrificed for a plant which is simple in construction and easy to start up at once, or run without any or very little skilled attention. It is assumed that the load will be a lighting one for the first year, and to keep down the initial cost of plant I would recommend a voltage of 25 be adopted for the lighting, and a separate circuit of 100 volts for power. The cells for the lighting to be of such a size that when more are added in series for the power circuit, the initial ones will be of sufficient capacity to supply the radiators, &c., or, if first cost is no object, make the power and lighting 100 volts. If a lower voltage than 100 were adopted for heating, the current which the wiring would be called upon to carry would be excessive, and also the various appliances might be difficult to obtain. The table shown below gives the capital and running costs for steam, producer gas, and oil plant, including accumulators and switchboard, it being left for reasons stated above for the querist to decide which will suit his purpose best. A 5-kw. set has been chosen, as this will cover any reasonable extensions. The tables of costs are worked out on an approximation of 3 b.h.p. running for 1,000 hours the first year; this will allow for incidental accumulator charging. Using the plant for power as well as light has brought up the capital cost considerably. A paraffin set to light sixty 16-c.p. 25-volt metallic lamps could be bought for £120, including switchboard, accumulators, &c., and the cost to run per hour would be approximately 1½d. Petrol sets have purposely been omitted, as the price of petrol has increased enormously of late years, the demand for it increasing daily may at any moment bring the price per gallon to a prohibitive figure.

**5-KW. OIL ENGINE PLANT (including Accumulators, Switchboard, &c.)—Capital Cost, £200.**

*Cost of Electric Light for one year (3 b.h.p. running 1,000 hours).*

	£	s.	d.
Paraffin oil, 375 gals. at 7d. ....	10	18	9

Depreciation at 10 per cent. ....	30	0	0
	<b>£50</b>	<b>0</b>	<b>0</b>

**5-KW. STEAM ENGINE PLANT (including Accumulators, Switchboard, &c.)—Capital Cost, £205.**

*Cost of Electric Light for one year (3 b.h.p. running 1,000 hours).*

	£	s.	d.
Coal at 7 lbs. per h.p. at 20s. ....	9	0	0
Lubricating oil, sundries ....	1	15	0
Renewal of lamps ....	1	0	0
Interest on £205 capital at 5 per cent. ....	10	5	0
Depreciation at 10 per cent. ....	20	5	0
	<b>£42</b>	<b>5</b>	<b>0</b>

Another reply that may be mentioned is that of "M. M." who assumes a 6-kw. plant and puts the capital costs of the generating plant at £200 for town gas, oil, or petrol, £260 for steam, and £280 for suction gas, and of the battery (50 volts) at £100. He naively remarks, "Undoubtedly the best way is to have a proper specification drawn up and get tenders from reputable firms."

**ANSWERS TO No. 1,320.**

In awarding the first prize to "Phiy" last week, the examiner who dealt with the question approved of the clear manner in which the answer was given, but unfortunately overlooked some errors of decimal places in the course of the

calculations; the final figure given in the answer was correct. We consider that, in the circumstances, the first award should have been made to "J. E. R. R.," who was classed as second, and we have sent him a further remittance of 5s.

**CATALOGUES, PAMPHLETS, &c., RECEIVED**

**ELECTRIC HEATERS.**—We have received from the London Electrical Trading Co., Ltd., a copy of an effective show card which they have prepared to advertise their well-known "Pygmy" heaters, of which, we understand, nearly 10,000 have been sold since they were first placed upon the market last autumn. Copies of this card can be obtained either from them or through any of the agents dealing with Bastian electric heating apparatus.

**ELECTRIC HEATING.**—We have received a copy of an attractive little booklet on heating by electricity, which has been prepared with a view to spreading knowledge of its merits among consumers in Southampton. We must congratulate Mr. H. F. Street (Borough Electrical Engineer) on the way the subject has been presented, and we must also congratulate his consumers on being able to obtain the advantages of electric heating at ½d. per unit. The booklet is the result of co-operation between the Electricity Department, manufacturers, and local contractors.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**JOINT-BOX COMPOUND.**—Two pamphlets from the Dussek Bitumen Co. (Canal Bank, Deptford, S.E.) deal with the company's "Trinidite" joint-box compound. One contains some results of tests and other information on the material, while in the second its extensive use is reflected by testimonials and lists of users. The company will be glad to forward copies to those of our readers who are interested in mains work.

**METAL FILAMENT LAMPS.**—The latest list of "Leuconium" metal filament lamps made (in England) by the Stearn Electric Lamp Co. deals with lamps ranging from 15 to 600 watts, for circuits of 200 volts and upwards, and from 8 to 300 watts for 100-120 volts. Lamps for lower voltages are also listed, including those for motor-car lighting and medical purposes, as well as lamps in flame and other special bulbs. These lamps are made under license under Patent No. 23,899/04.

**CALENDARS.**—We have received from the Bat Meter Co., Ltd. (3 Eden Street, Hampstead Road, N.W.), a copy of their office wall calendar for 1913, which bears a full-sized illustration of one of their meters.

The calendar which is being sent out to their friends by Callenders Cable and Construction Co., Ltd. (Hamilton House, Victoria Embankment, E.C.), bears a large and excellent photograph of the historic Kashmir Gate, Delhi, with the familiar sight of some of Callenders cable drums in the foreground.

**Scottish Local Section of the Institution of Electrical Engineers.**—At a meeting of this Section on January 14th, at Glasgow University, Messrs. J. S. Nicholson and B. Parker Haigh read their Paper entitled "A Single-phase Motor with Pole-changing Windings." (An abstract of this Paper, with a report of the discussion thereon in London, appeared in *ELECTRICAL ENGINEERING*, Vol. VIII., page 705, Dec. 19th, 1912.) The Chairman and Mr. J. Hally Craig thanked the authors for their valuable contribution, and as no member present offered to contribute to a discussion the meeting adjourned to the James Watt Laboratory, where Mr. Haigh explained the several winding arrangements of the motor, and demonstrated its running with eight poles as a plain repulsion motor, and with four poles as a compensated-repulsion motor with eight working brushes connected together in four pairs. The motor was run at variable speed and load, and, although started at 50 per cent. overload, it ran sparklessly under these conditions.

**Boycott of German Electrical Manufactures in Prague.**—Towards the end of December last the municipal electric supply undertakings of Prague issued circulars to the effect that they would in future only connect to their mains such installations the plant of which was of home manufacture (Czechish), which announcement practically corresponds to a boycott of German plant. In spite of vigorous protests, the authorities intend, according to the *Neue Freie Presse*, to pursue this policy, and there is a probability of its being extended to the districts outside Prague itself. According to the *Prager Tageblatt*, the reason for this policy is the poor quality of the imported electrical plant, and the competition of the latter with home manufactures. The imported plant in 1908 was 50 per cent. of the total, rising in 1912 to 80 per cent. This move of the authorities is condemned by the Prague Chamber of Commerce, and, as the *Elektrotechnische Zeitschrift* points out, is likely to do more harm than good to the Czechish local industries.

## ELECTRIC TRACTION NOTES

The Dundee Tramways Committee have decided to postpone for three months an extension of the trolley omnibus system over a distance of 1 mile 560 yards. The Tramway Manager, in reporting an estimated capital expenditure of £2,400 upon this route, expressed the opinion that it was doubtful whether it would pay, but that bearing in mind the extremely low working expenses of trolley omnibuses, the loss would not be very great, and was justifiable in view of the advantage to the public.

The Liverpool Tramways Committee, having considered the estimates for 1913, have felt justified in recommending that a sum of £97,000 be ear-marked for the relief of rates from the tramway profits for the current year.

The Bradford Corporation are to give a trial to the Mercedes-Stoll trolley omnibus system.

A commencement has been made with the installation of the Mercedes-Stoll system of trolley omnibuses in Aberdare, which is to be run in connection with the tramway undertaking.

The question of running a Sunday service of tramcars in Bournemouth, which has been one of acute controversy there for many years, has again been put to the vote of the rate-payers. Hitherto there has been a solid majority against Sunday cars. On this occasion, however, there is a majority of 448 in favour.

The London County Council, at its meeting on Tuesday, discussed a report by the General Purposes Committee which pointed out that the Government is apparently indisposed to appoint an independent Traffic Board for London. The discussion which took place was more or less on party lines, it being desired on the one hand that the London County Council itself should be the Traffic Board, whereas the Committee realise that an authority like the L.C.C., owning a large tramway system, is hardly the one to administer the needs of all classes of traffic in London. No resolution was passed however.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

We have received a copy of the first issue of a new French monthly journal devoted entirely to wireless telegraphy and wireless telephony, and entitled "T.S.F." This is, we believe, the first publication of its kind excepting the periodicals issued by the leading wireless telegraph firms. Articles appear on various aspects of wireless telegraphy, on mercury coherers, and a general series of chapters on the applications of electric waves commences. The methods employed in Paris for wireless time signals are also described. From a list given it appears that French coast stations open to public service now exist at Ajaccio, Boulogne, Bouscat, Brest-Kerlaer, Cherbourg, Cros de Cagnes (Nice), Dieppe, Dunkerque, Fort de l'Eau (Algiers), Lorient, Quessant, Rochefort, and Saintes-Maries de la Mer.

The Postmaster-General, in reply to a deputation from the Northern Scottish towns (ELECTRICAL ENGINEERING, Jan. 16th, 1913, p. 41), said that the use of "phantom" circuits was being experimented with. We have reason to believe, however, that the Engineering Department of the Post Office is not particularly sanguine as to the likelihood of any large extension of this system on the long-distance telephone land lines. The congestion complained of only arises during bad weather, when some of the telegraph and telephone circuits are interrupted, and in such conditions it would not be practicable to work phantom. Any additional earth occurring would interrupt not only the circuit on which the fault occurred, but also the second circuit and the phantom circuit, so that three circuits might be interrupted instead of one. Phantom working is in extensive use for obtaining trunk connections, so that the line may be used at maximum load

factor for speaking, but it is not adopted, we believe, for subscribers, as it is always more or less noisy. On the other hand, in the case of underground lines in which each pair of wires in the cable has practically the same four line factors, resistance, inductance, capacity and insulation, phantom circuits are certainly applicable, and our readers will remember the excellent results obtained on the new Anglo-French telephone cable recently. According to a cable from the New York correspondent of the *Daily Telegraph*, a telephone line is to be put up from New York to San Francisco, a distance of 3,860 miles. Loading coils will, of course, be employed, as this will be the only method to overcome the distance, but it appears from the message that the use of a phantom circuit is also contemplated. This is referred to as a new discovery, but the possibilities of the phantom circuit were known and employed by the National Telephone Company on some of their junction and trunk lines sixteen years ago at least; in fact, the method was described in the *Electrician* of September 17th, 1897, in the course of a series of articles on telephony, by Mr. F. C. Raphael (who is now Editor of *ELECTRICAL ENGINEERING*). It may be, of course, that some new method of overcoming the difficulties in employing a phantom circuit on long land lines has been discovered by telephone engineers in the United States, and we look forward to further information with interest.

A little surprise was in store for the House of Commons Committee which is inquiring into the proposed Imperial wireless telegraph scheme, when it met on Monday, for the Postmaster-General handed the Chairman a letter which he had received from Marconi's Wireless Telegraph Co. in which they asked the Government to allow them to regard the proposed contract as no longer binding upon them. The reason adduced was that, owing to the delay entailed by the protracted inquiry, the Company's position is being prejudiced in other parts of the world, inasmuch as a large engineering staff is being detained in London while remunerative work is waiting to be done. The Company complain that a Committee should have been appointed to inquire into the contract after eight months' negotiations with the Government, and suggest that they had the right to expect that, after such lengthy negotiations, the agreement should have been ratified by Parliament. The letter was read by the Chairman of the Committee, but no comment was made upon its contents. Sir G. Croydon Marks, M.P., gave further evidence, and suggested that the Government should employ a firm of consulting engineers to prepare a specification for the scheme and to throw it open to the world for tender, the price to be a lump sum including the right to the use of patents. The suggestion previously made that the Government had made inquiries as to the purchase of the Poulsen patents was reiterated by Mr. V. Gandil, the representative in this country of the Poulsen interests, but Mr. E. W. Farnall, Assistant Secretary of the Post Office, explained to the Committee that inquiries were at the time made of the owners of the Poulsen patents on the question of purchase only with a view to seeing whether it would be possible for the Marconi Company to buy the Poulsen patents and so strengthen their hands against the Government. In connection with the interim report of the Committee, it is announced that the Government has expressed its pleasure in being able to give immediate effect to the recommendations contained in it.

An action is proceeding before Mr. Justice Scrutton, sitting as the commercial judge in the King's Bench Division of the High Court, between Marconi's Wireless Telegraph Co. and Messrs. Goukassoff & Co., in connection with the efforts of the Marconi Co. to acquire a controlling interest in the Russian Telegraph & Telephone Company. The case turns upon the construction of certain documents which had for their object the buying out of Messrs. Goukassoff & Co., who were large shareholders in the Russian Telegraph & Telephone Company.

On the 5th inst. the Fao cable route was down beyond Konia, and was restored the next day.—The Cayenne-Salinas cable was repaired on 17th inst. and the Paramaribo-Cayenne section on the 20th inst.—The new German cable from Monrovia to Lorne and Duala was opened for traffic on the 20th inst.

## "ELECTRICAL ENGINEERING" PATENT RECORD

*(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)*

### Specifications Published Jan. 16, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

20,917/11. **Improving Quality of Steels.** W. S. SIMPSON. Steel or iron surfaces are impregnated with metallic or carbon compounds for hardening, toughening, &c., by fusion in a vacuum. The alloying elements are added and carbonised by the introduction of iron carbides *in situ*. The furnace comprises a flat metallic base with rails on which runs a truck containing the iron to be treated. This truck may be racked laterally within a dome, which covers it and makes the chamber airtight, so that a vacuum can be maintained. The dome is cooled by water. Adjustable electrodes are suspended from the dome. They may be worked singly, in pairs, or all together. Four figures.

29,138/11. **D.C. Motor Controller.** P. S. TURNER. To obtain fine speed adjustment and creeping speeds on low loads, resistance is put in series with the armature, which is also shunted by an adjustable resistance. The controller is in two parts, one for the series and the other for the shunt resistance. These are interlocked, so that the shunt circuit cannot be completed or broken unless the series controller is in one of certain positions. Similarly the series controller can only be moved within limits depending on the amount of shunt resistance in circuit. Four figures.

29,224/11. **Magnetic Separators.** KRUPP A.-G. In separators where a number of fixed magnetic poles are arranged in a circle round a vertical axis, a non-magnetisable rotating cylinder is used, so that it shields the magnet poles and the air gaps from the material under treatment. All the magnet poles, and the armatures, if used, assist in holding the material to the cylinder. Two figures.

627/12. **Supplementary Protection to Tirrill Regulator.** B.T.-H. and A. P. YOUNG. In order to keep the generator pressure at a safe value in the event of abnormal pressure rise or fall on the system, an electromagnet is connected across the supply mains. This magnet controls an armature carrying a contact connected to an exciter bus-bar, against controlling springs, so that normally it is free of an upper and lower fixed contact connected to one end of the winding of the magnet and to the second exciter bus-bar respectively. The armature of the magnet is carried by a pivoted lever retaining catch for a spring-controlled switch, which is released by excessive pressure variations. It prevents further action of the automatic regulator by breaking the relay circuits, and makes connection with intermediate portions of the generator field resistances. Three figures.

5,469/12. **Trolley Collectors.** E. P. B. ESTLER. When two or more trolley lines are used the trolley arms are mounted one above the other on the same vertical axis, so that they each act independently. Three figures.

6,673/12. **Combined Switch and Plug.** W. E. WATSON. The detachable portion of the plug fouls the switch handle when it is in the closed position, so that it must be moved to the open position before the plug can be withdrawn from or inserted in the socket. Two figures.

7,780/12. **Indicating Movement at a Distance.** SOC. COURTAUD. G. GARNIER GIL. The opening and closing movements of valves, &c., are reproduced at a distance on a reduced scale. Motion of the operating handle controls contacts whereby current is fed into the receiver, and reproduces in front of an aperture the amplitude of the movement at the transmitting end. The receiver comprises a shaft controlled for each direction of rotation by a ratchet wheel meshing with a boss or cam keyed upon the shaft. The pawl of this ratchet is influenced by the electromagnet. The shaft carries the revolution indicator and a pinion acting on a rack, which carries the slide, which moves in front of the aperture. Sixteen figures.

18,440/12. **Electromagnetic Brake.** ALBERT TRODE. The brake has a series of poles serving as brake shoes disposed behind one another along the rail. The gaps between the poles and the rail are inclined, so that the magnetic lines are distributed over a cross-section greater in width than the normal, whereby the area of the top of the rail open to saturation is increased. The braking power is consequently greater. Three figures.

### Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free. Names in *italics* indicate communicators of inventions from abroad. Summaries of some of the more important of these patents will appear in our next issue.

**Arc Lamps:** QUINT [Enclosed flame] 3,065/12.  
**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** BUTLER [Manufacture of conduits] 29,390/11.  
**Electrometallurgy:** BALLY [Induction furnaces] 16,040/12.  
**Heating and Cooking:** TOWNSHEND [Elements] 387/12.  
**Incandescent Lamps:** BARTLEY [Storage battery lamp] 71/12.  
**Instruments:** MURRAY [Testing circuit connections] 26,337/12.  
**Switchgear, Fuses, and Fittings:** WHYMAN [Switches] 27,254/11; SEFTON-JONES (*American Automotoneer Co.*) [Controllers] 523/12; BYNG and COLLINGS [Supporting lamps] 7,137/12.  
**Telephony and Telegraphy:** MARCONI and FRANKLIN [Receivers for wireless] 86/12; BROWN [Telephone receiver holder] 416/12; MARCONI's and PRINCE [Aerials] 2,456/12; SIEWERT [Telescopic masts] 26,914/12.  
**Traction:** B.T.-H. (*G.E. Co., U.S.A.*) [Locomotives] 3,231/12; MARINO [Petrol-electric system of power transmission] 13,780/12; MAGNET BREMSSEN Ges. [Electro-magnetic track brakes] 26,295/12.  
**Miscellaneous:** SAHNER [Locking of locks] 26,341/11; HACKETT and WHATTAM [Equipment for roundabouts, scenic railways, &c.] 28,899/11 and 27,046/12; BATES, KELLY and CORBIN [Cinematograph targets] 29,083/11 and 15,031/12; KRUPP A.-G. [Magnetic separators] 29,201/11; ULLRICH [Magnetic separators] 29,230/11; DICKIE [Safety lamps] 29,334/11; SPARKES [Safety lamps] 78/12.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Arc Lamps:** KORTING & MATHIESEN [Differential converging carbon] 26,318/12.  
**Fuses:** CHRISTIANS, 19,533/12.  
**Heating:** SCHAEFFER [Hot air douches] 20,191/12.  
**Telephony:** TELEPHONFABRIK BERLINER [Secret intercommunication] 16,084/12.  
**Traction:** PIEPER [Petrol-electric] 29,636/12.

### Amendment to Specification

9,363/12. **Pressure Regulator for Variable-speed Dynamo.** W. E. LAKE (*U.S. Light & Heating Co.*). As a result of the extended investigation under Sect. 8, this specification has been amended by way of disclaimer.

The following Amended Specification may now be obtained.  
 15,725/11. **Telephone Mouthpiece.** C. F. KILLAR.

### Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

1,862 of January 26th, 1899. **Wireless Telegraphy.** F. BRAUN. To render the radiations used in wireless telegraphy able to negotiate obstacles in their path, it was proposed in this specification to use radiations of considerable wave-length and low frequency. Connections utilising Leyden jars with or without induction coils in circuit with a spark gap and antenna are described.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Dynamos and Motors:** B.T.-H. (*G.E. Co., U.S.A.*) [Rotor (primary) of 3-phase A.C. motor has slip rings and commutator. Three brushes take slip currents to stator] 21,873/06.

**Electrochemistry and Electrometallurgy:** W. SIMM and H. SIMM [Resistance furnace on wheeled truck for producing zinc oxide from ores] 21,787/06; M. RUTHENBERG [Electrodes for resistance furnace] 21,876/06.

**Ignition:** E. DENIEPORT [Magnetos and timing gear] 21,699/07.  
**Incandescent Lamps:** B.T.-H. (*G.E. Co., U.S.A.*) [Supports for and method of connecting metal filaments to] 21,668/06; [Jointing metal filaments to one another] 21,669/06.

**Instruments and Meters:** ELEKTRIZITÄTS A.-G. [Maximum demand indicators] 21,467/07.

**Miscellaneous:** F. W. HOLICK [Capstan with vertical motor: brake, lubricating, and other details] 21,453/02.

## LOCAL NOTES

**Barking: Bulk Supply.**—The Council have approached the West Ham Corporation with a view to obtaining a supply of electricity in bulk, but the West Ham Lighting Committee do not feel in the position to recommend their Council to negotiate with regard to the matter.

**Brighton: Electric Cooking.**—An electric kitchen is being fitted up by Messrs. Stafford in Crown Street capable of cooking for 100 people. The Corporation have supplied the electrical apparatus.

**Chatham: Street Lighting.**—The Kent Electric Power Co. have started upon the work of installing centrally hung lamps in the High Street. The capital cost to the Corporation will be £357 and the annual cost £450. The lamps, which are twenty-three in number, are each fitted with a 600-c.p. Osram lamp, with reflectors 2 ft. 6 in. in diameter. Time switches have been fitted.

**Cromer: The Electricity Undertaking.**—Contrary to the position at Hove, where the ratepayers object to the purchase of the local electric supply company, the Council are in conflict with its ratepayers as to the transfer of its undertaking to Messrs. Edmundsons' Corporation. Several ratepayers' meetings have voted against the proposal, and the Council have now decided to take a poll of the ratepayers on the matter.

**Edinburgh: Municipal Wiring.**—A deputation of electrical contractors waited upon the Corporation last week, objecting to Clause 164 of the Provisional Order which has been deposited for next session of Parliament, which gives the Corporation full wiring powers. It was urged that no complaint had been made against the electrical contractors in the city, and Bailie Stevenson said he understood that the Corporation's clause would prohibit them from doing the work direct.

**Gillingham: The New Diesel Engine.**—A new Diesel engine and generator having been ordered by the Council, subject to the consent to the necessary loan being given by the Local Government Board, the makers have not felt justified in putting the work in hand until the consent is actually received. As the plant is urgently needed, however, and in order to avoid the delay of waiting until the Local Government Board give their sanction, the Council have agreed with the makers to buy the set in any case, and if the Board's sanction is withheld, to pay for it by twelve equal quarterly instalments with interest at 5 per cent. per annum on the balance remaining unpaid.

**Grimsbay: Street Electric Lighting.**—By the end of January 1,192 gas lamps will have been replaced by electric lamps for street lighting. The Electricity Department have also converted 712 single electric lamps into two-light standards.

**Hove: Purchase of Supply Co.**—Although the Hove Council have decided by a majority to proceed with the Bill for the purchase of the Hove and District Electric Lighting Co., a statutory meeting of ratepayers confirming the promotion of the Bill has resulted in an adverse vote. Already a meeting of ratepayers has given a similar verdict, and it remains to be seen whether these two decisions of the ratepayers against the Council's proposal will in any way modify the position.

**London: Shoreditch: Street Lighting.**—We reported in our columns some time ago that all the incandescent street gas-lighting was to be superseded by incandescent electric lighting, and of the 1,500 gas lamps in side streets 400 have been changed over to metal filament lamps, and the balance will be changed over during the present year. In addition to these, there are 322 12½-ampere open-type arc lamps in the main thoroughfares, and with a view to economy and at the same time greater efficiency, the Council have decided to change over ninety-six of these lamps to 8-ampere flame arcs. Of these forty-eight will be of the General Electric Co.'s "Angold" type, and forty-eight of Messrs. Johnson and Phillips "Mero-flam" type. This is in the nature of an experiment, and upon the results of it will depend the future of the remaining open-type arc lamps. The financial saving on the new arc-lamp scheme is estimated at £476 per annum, and the candle power will be 2,500 against 1,500 for the old lamps.

**North Metropolitan Electric Power Co.: Ljungstrom Turbines.**—The North Metropolitan Electric Power Supply Co. have on order one 5,000-kw. and one 1,000-kw. Ljungstrom steam turbine, the rights in this country for which, as recently announced in our columns, have been acquired by the Brush Electrical Engineering Company.

**Scarborough: Purchase of Supply Co.**—A Special Committee has been appointed to consider whether the Corporation

should exercise their right to purchase the Scarborough Electric Supply Co.

**Suffolk: The Electric Supply Co.**—The shareholders of the Suffolk Electricity Supply Co. have sanctioned the proposal for the sale of the Company in accordance with the offer recently made by Dr. Leibbrand.

**Torquay: Smoke Nuisance.**—The Corporation have been summoned by members of the Royal Torbay Yacht Club for allowing the emission of black smoke from the Electricity Works chimney. It appears that similar proceedings were taken some eight years ago, and on a promise to abate the nuisance the case was withdrawn. Mr. C. W. Salt, the Borough Electrical Engineer, in his evidence stated that a twenty-five days' test showed a total duration of the emission of smoke of eleven-and-a-half hours. The real cause of difficulty appears to be the shortness of the chimney which precludes the possibility of a good natural draught. The machinery, it was contended, is up-to-date in every respect. After hearing the evidence, the Bench expressed the opinion that the matter might rest where it is, pending the raising of the height of the chimney. An application on behalf of the Yacht Club for a case to be stated was not allowed by the Bench.

**Wolverhampton: Borough Electrical Engineer's Resignation.**—At the last meeting of the Council, Mr. C. E. C. Shawfield's resignation, referred to in our last two issues, was received with regret. Mr Shawfield, in tendering his resignation, mentioned that he had been associated with the Electricity Supply Department for seventeen years, and that he was able to hand over to his successor an undertaking which has obtained some reputation for soundness as to its equipment and its financial stability.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

## Generating Stations, Sub-Stations, Mains, &amp;c.

**Aberdeen.**—Mr. J. A. Bell, the Borough Electrical Engineer, has presented a report in which he recommends important extensions at the power station. There is at present installed 5,580 kw. of plant, and assuming an increase in the current year of 75 per cent. of the past year's increase, this will only leave spare plant amounting to 205 kw., which is regarded as a dangerously low margin. It is therefore recommended that a 3,000 kw. turbo-alternator with condensing plant should be installed at an estimated cost of £9,750, together with 1,500 kw. of converting plant, £3,600, and switchboard, £750. The scheme is to dismantle the two 200 kw. sets, which are now eleven years old.

**Bolton.**—Turbo-alternators and condensing plant, water-tube boilers, economisers, switchgear and steam feed-pumps. Borough Electrical Engineer. Feb. 13th. (See an advertisement on another page.)

**Claughton-on-Sea.**—A 250-kw. Diesel engine, generator, &c. Borough Electrical Engineer. Jan. 29th.

**Hoylake and W. Kirby.**—High-tension switchgear and a 50-k.v.a. single-phase transformer. Borough Electrical Engineer. Jan. 31st.

**Liverpool.**—The Electrical Sub-committee has before it a lengthy report by the Electrical Engineer on proposed considerable extensions at the Lister Drive power house.

**London: Hackney.**—Estimates for the first part of the system of ring mains, sub-stations and sub-feeders in connection with the new power scheme of the Council have been prepared, and show that an estimated cost of £21,700 is necessary. Six-way fibre ducts laid in concrete have been included in order to make provision for the future, and to avoid the re-opening of trenches once the ducts are laid. These ducts will accommodate cables for 12,000 kw.

## THE RECORD ELECTRICAL Co., Ltd.

LONDON OFFICE:  
CAXTON HOUSE,  
WESTMINSTER, S.W.  
Telephone:  
3057 Victoria.

Telegrams & Cablegrams:  
"Infusion,

Write for Prices & Particulars.

WORKS:  
BROADHEATH,  
MANCHESTER.

Telephone:  
164 Altrincham.  
Telegrams & Cablegrams:  
"Infusion,  
Altrincham."

**Hammersmith.**—A loan of £3,000 for electrical extensions is to be taken up.

**Stepney.**—The loan of £13,000 which has been sanctioned is to be applied for by the Council, and is in no way concerned with the supply to Bethnal Green, which will, of course, involve a further expenditure.

**Long Eaton.**—A 500-kw. generating set and additional water-tube boiler are to be supplied at an estimated cost of £8,000.

**Shanghai.**—High and low-tension cable delivered c.i.f. Messrs. Preece, Cardew and Snell, 8 Queen Anne's Gate, Westminster. Jan 30th.

**Wallasey.**—The Electricity Committee are recommending to the Council the erection of a new power station involving an expenditure of £65,000. The site recommended is in Poulton where there are a large number of industrial undertakings which, it is anticipated, will become power users. Recently the demand for current for power purposes has been greater than the Committee have been in a position to supply, one application having been for an annual supply of 3,000,000 units.

**Whitehaven.**—A loan of £1,565 is to be applied for, principally in connection with mains extensions. Of this, however, £665 is excess expenditure over previous loans.

#### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Aberystwyth.**—New town hall.

**Airdrie.**—New police station.

**Altrincham.**—Cinematograph theatre.

**Bacup.**—Six shops. Architects, Smith and Cross, Town Hall Chambers, Rochdale.

**Bexley.**—New school.

**Hanley.**—New factory. Architect, E. L. Maddock and Sons.

**Huddersfield.**—Municipal art gallery in Greenhead Park.

**London:** St. Mary's Hall, Hottam Road, Putney.—Cinematograph Hall, High Street, Eltham.

**Preston.**—Fire station. Architect, T. B. Maxwell, Ribby Road, Kirkham.

Headquarters for East Lancashire Territorial Force Association.

**Rochdale.**—Considerable extensions at infirmary.

**Warrington.**—Public baths. Borough Electrical Engineer. Feb. 3rd.

**York.**—£50,000 church extension scheme.

#### Miscellaneous

**Leeds.**—Tenders are invited for annual supplies of various stores for the electricity undertaking. (See an advertisement on another page.)

**London.**—A three years' supply of main switches, main fuses, &c., is required by H.M. Office of Works. Hammersmith Borough Council invite tenders for meters and other electrical supplies and general stores. (See advertisements on another page.)

### APPOINTMENTS AND PERSONAL NOTES

Mr. John Coates, M.Inst.C.E., senior partner of the firm of John Coates and Co., Ltd., 25 Victoria Street, S.W., has been appointed to carry out the work of the inspection of material purchased for the Commonwealth railway construction and rolling stock in connection with the Australian Trans-Continental Railway.

Herr W. Braun, of Frankfurt, one of the founders of the well-known firm of Hartmann and Braun, and brother of Dr. Braun of Strassburg, died last month. Herr Braun was Chairman of the Board of Directors of Hartmann and Braun and was long connected with the Elektrizitäts A.G. vormals W. Lahmeyer and Co.

Owing to the appointment of Mr. J. M. Dawson (late Engineer-in-Charge, Hanley Electricity Works) to the position of Engineer-in-Chief to the Bethnal Green Board of Guardians, and to another vacancy due to the completion of the new Stoke-on-Trent power house, Mr. F. Hurst (Charge Engineer, Runcorn) and Mr. F. McK. Kissack (British Westinghouse Co.) have been appointed Charge Engineers under Mr. C. H. Yeaman.

It is recommended that the salary of Mr. J. W. Dugdale, Manager of the Oldham Corporation Tramways, be increased from £350 to £400 per annum.

Switchboard attendant is required at Newport (Mon.). (See advertisement on another page.)

Applications are invited for the post of Engineer and Manager of the Wolverhampton Corporation Electricity undertaking, at a commencing salary of £600 per annum. (See advertisement on another page.)

The Hon. T. H. W. Pelham, C.B., is retiring from the Assistant Secretaryship of the Harbour Department of the Board of Trade, under the age limit. This Department has charge of all work under the Electric Lighting Acts, and in this connection Mr. Pelham has held a large number of local inquiries when these have been necessary owing to there being more than one application for provisional orders. Mr. Garnham Roper, at present principal clerk in the Harbour Department, has been appointed to succeed Mr. Pelham, and the electric lighting work is, as hitherto, under the charge of Mr. H. Booth.

### TENDERS RECEIVED AND ACCEPTED

**Heywood.**—400 new condenser tubes are to be purchased from Messrs. Isaac Storey and Sons.

**Keighley.**—The Electricity Committee's recommendation that the tender of Messrs. Willans and Robinson should be accepted at £5,827 for a 2,000-kw. turbo-alternator with exciter and surface condenser, has been agreed to by the Corporation. The alternator will be of the Dick-Kerr type.

**London: Battersea.**—The contract with Messrs. Callender's Cable and Construction Co. for a supply of cable has been renewed for the ensuing twelve months.

**L.C.C.**—The tender of Messrs. T. Bolton and Son, at £109 4s. per mile for 3½ miles of grooved trolley wire has been accepted.

**Salford.**—The following tenders have been accepted by the Corporation:—Electric lighting and bells at new offices, Willoughby and Wilcox (Salford), £142 10s.; electrical fittings for board room, laundry and clerk's office, G. Matthews (Manchester), £25 7s.

### MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith and Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £74 10s. to £75. (Last week £78 10s. to £79.)

**The Tungsten Lamp Association.**—We are informed that the Stearn Electric Lamp Co., Ltd., have now joined the Tungsten Lamp Association and now manufacture their "Leuconium" lamps under licence under Patent No. 23,899 04.

**The Sun Electrical Co.'s Souvenir.**—The Sun Electrical Co., Ltd. (118-120 Charing Cross Road, W.C.), ask us to state that, in consequence of the large demand for the souvenir pencils which, as we announced on Jan 2nd (p. 9), they are giving to their friends, the stock is quite exhausted and they regret their inability to comply with all the requests.

**The Phoenix Electric Heating Co.**—We are informed that this Company (11 Mornell Street, Tottenham Court Road, W.C.) has acquired the goodwill, stock and plant of Plumstead and Co., brass finishers and electrical fittings manufacturers, together with the services of Mr. F. Plumstead.

**Ediswan Lamps.**—The Edison and Swan United Electric Light Co., 35 Queen Street, E.C., has received the honour of Appointment to Her Majesty Queen Alexandra for the supply of metal filament and carbon filament lamps.

**Removal of the B.T.-H. Switchgear Department to Willesden.**—The switchgear department of the British Thomson-Houston Co. is to be transferred from Rugby to the Company's works at Willesden, and the lamp manufacture will be concentrated at Rugby. The change will take place within the next two months and will involve the removal of the engineering staff connected with the department and some workmen. The remaining men will be engaged at Willesden.

**Ernest Scott and Mountain, Ltd.**—The works of this firm at Gateshead have been purchased together with most of the plant and the goodwill by C. A. Parsons and Co. (Heaton Works, Newcastle). The works will be chiefly engaged in assisting their general manufactures as well as continuing the business carried on by Ernest Scott and Mountain.

## SUMMARY

MR. J. E. EDGCOMBE, Borough Electrical Engineer of Kingston-on-Thames, has been elected President of the Incorporated Municipal Electrical Association, in place of Mr. C. E. C. Shawfield, who has resigned. (Page 58.)

THE results of the working of the large battery at the Dickinson Street Station of the Manchester Corporation were described in a paper by Mr. F. H. Whysall, read before the Institution of Electrical Engineers last Thursday, when the use of large batteries was discussed generally. (Page 59.)

THE Report of the Council of the British Electrical and Allied Manufacturers' Association for the past year records considerable activity. Among the questions dealt with were sub-contractors' tenders, the effect of the Unemployment section of the National Insurance Act, and the question of railway rates for the carriage of electrical equipment. The Annual Dinner, held on the 24th inst., was very well attended. The speeches dealt largely with the advantages of co-operation between manufacturers and supply authorities and financiers. (Page 60.)

THE Institution of Electrical Engineers has now definitely decided to establish a lending library. (Page 60.)

THE suggestion has been made in America to adopt the "myriawatt" (1,000 watts) for the rating of boilers, engines, &c. (Page 61.)

A NEW 2,000-kw. turbo-alternator, complete with condensing plant, switchgear, &c., has been taken into use at Blackburn, and a second similar set is under erection. (Page 61.)

A PAPER by Mr. W. H. Dexter, discussed recently by the Yorkshire Local Section of the Institution of Electrical Engineers, surveyed some recent developments in the design of condensing plant. (Page 62.)

THE arrangement of two auto-transformers in V connection is discussed in our "Questions and Answers" columns. (Page 63.)

A NEW heater for shipboard use is described on page 62.

THE standardisation of a cheap electric cooking set is being considered by the "Point Fives." (Page 62.)

A NEW form of electric light fitting, some porcelain handle fuses, and a folding scaffold, are described on page 64.

A H.T. CABLE breakdown on the L.C.C. tram system caused surges and a serious temporary suspension of service, besides burning out five motor-generators.—The Directors of the London Brighton & South Coast Railway have definitely decided to equip practically the whole of their suburban lines as far as Croydon for electric traction on the single-phase system.—Sir H. A. Yorke's report on the recent Tube railway accident attributes the collision to failure of the train-stop and negligence of the driver, and states there is no reason for suggesting that automatic signalling has proved a failure. (Page 65.)

THE Government has appointed a Committee of Experts to consider the competing systems of long-distance wireless telegraphy.—The action between the Marconi Co. and a Russian firm has just been concluded.—An address on the subject of automatic telephones was given recently by Mr. W. Aitken before the members of the Western Local Section of the Institution of Electrical Engineers. (Page 65.)

THE Specifications published by the Patent Office last Thursday included one dealing with enclosed flame arcs

by B. A. Quint, and one for a heating element, consisting of a resistor wound on a pipeclay carrier, by E. Townshend, as well as two connected with wireless telegraphy. The first, by G. Marconi and C. S. Franklin, covers the use of a series dynamo with a detector and two relays to increase the strength of received signals, and the second covers the use of two closed antennæ at right-angles to determine the direction of the sending station by equalising or comparing the currents produced. This Specification is by the Marconi Co. and C. E. Prince. (Page 66.)

A SPECIAL Committee at Manchester has fixed the proportion of profits that can be devoted to relief of rates at one per cent. of the capital expenditure.—The Woolwich Council have made an offer to give a bulk supply to Erith.—An electrical exhibition is under consideration at Glasgow.—The tariff for lighting has been increased, but for heating and cooking has been decreased at Ayr. (Page 67.)

New generating plant will probably soon be required at Erith; tenders are being invited for a 1,000-kw. turbo-generator and other plant at Grimsby; rotary-converters are required at Stalybridge; the London County Council are to reconstruct part of the tracks recently acquired from the London United Tramways Company. (Page 67.)

### ARRANGEMENTS FOR THE WEEK

FRIDAY, JANUARY 31st.

*Electrical Engineers' Ball.*

At Hotel Cecil.

TUESDAY, FEBRUARY 4th.

*Institution of Electrical Engineers: Manchester Students' Section.*

7.30 p.m. At Municipal School of Technology. "Winding of Electrical Machinery," by A. T. Robertson.

*Institution of Electrical Engineers: Glasgow Students' Section.*

8 p.m. At the Royal Technical College. "Electrical Estimates and Opportunities," by N. C. Woodfin.

*Rugby Engineering Society.*

8 p.m. At Benn Buildings. "High-speed Bearings," by J. C. K. Balfry.

WEDNESDAY, FEBRUARY 5th.

*Institution of Electrical Engineers: Students' Section.*

7.45 p.m. At Victoria Embankment. "Low and Mixed Pressure Turbine Plant," by Chas. H. Goulden.

*Royal Society of Arts.*

8 p.m. "The Economic and Hygienic Value of Good Illumination," by Leon Gaster.

### The London Electrical Engineers.

(To-day) THURSDAY, JANUARY 30th. C. Company.—Company Training, 7 to 10 p.m.

FRIDAY, JANUARY 31st. D. Company.—Recruit Training, 7 to 10 p.m.; Company Training, 7 to 10 p.m.

SATURDAY, FEBRUARY 1st. B. Company.—Week-end run at Fort Coalhouse. Parade at Finchurch Street Station, 3 p.m. Service dress. No arms. A. Company.—Lorry run. The Lorry Crew will parade at Headquarters at 2.30 p.m. Service dress. No arms. Headquarters open for Regimental business from 10 a.m. till 12 noon.

MONDAY, FEBRUARY 3rd. A. Company.—Recruit Training, 7 to 10 p.m.; Company Training, 7 to 10 p.m.

TUESDAY, FEBRUARY 4th. B. Company.—Recruit Training, 7 to 10 p.m.; Company Training, 7 to 10 p.m.

THURSDAY, FEBRUARY 6th. C. Company.—Company Training, 7 to 10 p.m.

### THE I.M.E.A. PRESIDENCY

THE Presidency of the Incorporated Municipal Electrical Association, rendered vacant through Mr. C. E. C. Shawfield leaving municipal employment (as announced in our issue of Jan. 9), has been offered to Mr. J. E. Edgecome, who has accepted it. Mr. Edgecome is Borough Electrical Engineer of Kingston-upon-Thames, and has been President of the Association once before—in 1906. He is also Honorary Treasurer of the Association.

Mr. Edgecome assumes the Presidency at once, and will remain in office until the close of the Annual Convention this summer, which will be held in London as previously arranged, after which it may be assumed that he will be succeeded by Mr. R. A. Chattock, City Electrical Engineer, Birmingham, who is Senior Vice-President. We understand that Mr. Chattock was first invited to take up the Presidency, but preferred not to accept it for this year's meeting. In the ordinary course he will be elected to the Presidency at the Annual General Meeting which is held at the close of the Convention, and next year's meeting will take place in Birmingham.

NEWLY-ELECTED MEMBER OF ELECTRICITY COMMITTEE:—I presume this is the battery which was stated in a paper read at the Institution of Electrical Engineers to be "a sound commercial proposition when considered in connection with a large lighting load."

INTELLIGENT YOUTH (rising to the occasion):—Yes, sir.

## THE LARGE CENTRAL STATION BATTERY AT MANCHESTER

IN a paper entitled "The Use of a Large Lighting Battery in Connection with Central Station Supply," discussed at last Thursday's London meeting of the Institution of Electrical Engineers, Mr. F. H. Whysall gave some results of the working of the 12,000-ampere-hour Tudor battery installed in 1910 at the Dickinson Street Station of the Manchester Corporation. A full description of the battery and of the booster and switchgear in conjunction with which it is worked was given in *ELECTRICAL ENGINEERING*, Vol. VI., p. 261 (April 21st, 1910), and the leading particulars are recapitulated below.

There are 210 cells in pitch-pine, lead-lined boxes (6 ft.  $1\frac{1}{2}$  in. long, 2 ft.  $2\frac{1}{2}$  in. wide, and 3 ft.  $4\frac{1}{2}$  in. high), each containing 38 positive plates ( $20\frac{1}{2} \times 29 \times 0.4$  in.) of Planté formation cast in one piece, and 39 box-type negative plates (0.31 in. thick) composed of half grids riveted together, with the spaces between them filled with active material. Treated wood separators are used, and a free space of 8 in. is left at the bottom of each cell for accumulation of deposit. The guarantees were as follows: Discharge rate, max. 15,000 amps., one hour 8,400 amps.; charging rate 4,100 amps. normal, 6,500 amps. max.; max. charging voltage, 2.75 volts per cell; ampere-hour efficiency, 90 per cent.; watt-hour efficiency, 66 per cent. at 1-hour rate, 75 per cent. at 3-hour rate (3,900 amps.); final voltage per cell, 1.67 volts at 1-hour rate, 1.78 volts at 3-hour rate; weight of each cell, 2 tons 19 cwt.; of complete battery, 620 tons; floor space occupied, 5,966 sq. ft. The battery is regulated by three Turnbull-McLeod boosters run in parallel at times of maximum discharge. Each of these is capable of a maximum boost of 80 volts at 5,600 amps. It is not necessary to repeat here all the details of the switchgear. It is, naturally, of very substantial nature, and extensive use is made of aluminium.

An important feature is the provision of two substantial circuit-breakers inserted in the main cables as close as possible to the battery house. These circuit-breakers are of the magnetic blow-out type, and are capable of carrying 15,000 amperes continuously. Each is enclosed in a separate concrete cubicle, so as entirely to shield it from all other parts of the station, and each is electrically and independently operated from the switch-board by means of solenoids. (It will be remembered that the absence of some similar precaution to this in the Salford generating station was largely responsible for the serious fire recently, when it was found impossible to prevent the battery continuing to discharge into the faults.) (See *ELECTRICAL ENGINEERING*, January 2nd, page 9.)

The chief duty of the battery is to take 3,000 kw. off the lighting peak. It was originally intended to charge the battery on traction, thereby providing a constant load for one 1,800-kw. traction generator, and enabling it to do the whole of the traction load for the city area by discharging over the traction peaks; also to change the battery over to lighting for the lighting peak. It was found, however, that at certain times of the year the traction and lighting peaks were coincident.

It was anticipated from a consideration of typical winter load curves that the battery would increase the load factor of the steam plant from 32 per cent. to 43.5 per cent., but curves are reproduced in the paper to show that actually the battery brought the load factor up to 67 per cent. in summer and 49.1 per cent. in winter. This improvement in load factor, besides effecting other economies, brought the coal consumption down to 2.79 lb. per unit sent out. The commercial efficiency of the battery was for the first year 70.6 per cent., and for the second year 71.1 per cent.

An interesting case is mentioned of a storm load when the maximum demand (ignoring traction) was 44.5 per cent. greater than the boiler capacity at the commencement of the darkness; and the battery was able to take care of the rising peak load, ahead of the extra boilers which had to be got into commission. Without the battery it would have been impossible to get these extra boilers up in time.

The actual capital cost of the battery plant was £21,567 (which the author compares with a cost of £51,000 for equivalent steam plant). The interest and sinking-fund charges he gives as £2,642 (as against £3,698 for the steam plant). The cost per kw. of the battery plant works out at £7.1875 (which the author compares with £17 for steam plant).

Regarding the running costs, it is necessary to take into consideration the fact that the most uneconomical units are reserved for peak duty, also that these sets will not be run at their most economical load. Bare fuel cost per 1,000 kw. standby for this peak-load duty the author has estimated at £1 8s. per day. This latter charge becomes in

the case of a 3,000-kw. battery £4. 4s. per day for the bare one-hour rating of the battery. But when considering the effect of the battery on load factor it is unfair to credit the battery with standby savings on its bare capacity only; in the storm-load curve referred to it was demonstrated that the battery saved standby to the extent of 44.5 per cent. on the total boilers under steam at the beginning of the day, also that more boilers are necessary to meet sudden demands than can comfortably cope with an equivalent load applied gradually. It may be assumed that on this occasion a 3,000-kw. battery saved standby for its own capacity plus 44.5 per cent. of the boiler capacity prior to the storm, which was 7,200 kw. On this, continues the author, 44.5 per cent. is 3,200 kw. Calculating at the same rate without allowing anything for the increased price of coal, we see that our 3,000-kw. battery for the five summer months is equal to steam standby at the rate of £8 8s. per day. Reckoning on the basis of five days per week gives £924. Adding £630 to this on account of the standby saving for its own capacity for the other seven months, we have a yearly standby saving of £1,554. Comparing bare fuel cost per unit generated, and crediting the battery with a commercial efficiency of 70 per cent., we get a cost per unit (reckoning 2.5 lbs. of coal per unit at 12s. 5d. per ton) of 0.237d. against a cost of 1.55d. taken from the actual results shown on the load-factor curve for 8 per cent. load factor. The peak-load units discharged by the battery since its installation, calculated at the rate of five complete discharges per week—31st March, 1910, to 31st March, 1912—are 1,560,000, and represent an annual saving of £8,534. The total saving in running cost thus comes out at £10,088—a figure agreeing closely with the £10,166 obtained by the author from a consideration of the effect on the load factor only.

The paper concludes with some notes on the records kept in connection with the battery and its care and some general points on the advantages and disadvantages of central station batteries, and remarks that it is now being recognised that, provided the battery is installed to reduce generating plant, it is a sound commercial proposition when considered in connection with a large lighting load. A suggestion is further made that some consumers might find it pay to charge a battery at power rates during the day to use for lighting.

In opening the discussion, Mr. J. S. Highfield (Chief Engineer, Metropolitan Electric Supply Co.) said that in stations supplying large distribution systems the first usefulness of a battery was to give security and the second to relieve the peak load. The two requirements, however, somewhat interfered with each other, as a battery was of less use as a stand-by when it had been nearly discharged on the peak. He was in favour of hand-regulated boosters for large batteries. All boosters should have a short-circuiting switch so that they can be cut out instantly on emergency, and should be capable of very great overloads. This point of view was agreed to by several other speakers, but some, including Mr. W. Fennell (Borough Electrical Engineer, Wednesbury), who had experienced a bad booster breakdown, were in favour of the cell-regulating switch control largely practised on the Continent, and slides showing heavy current switches of this nature were shown by Mr. A. Hutt (Siemens Brothers Dynamo Works, Ltd.). Mr. Whysall, in his final reply, expressed a preference for booster control for peak-load work and regulating switches for emergency supply conditions. Mr. Highfield also complained that the usual system of charging for maintenance unduly penalised the careful user, who had to pay for the carelessness of others, but Mr. E. Jacob (Tudor Accumulator Co.) thought that there were difficulties in allowing for this, as all battery owners would declare themselves the most careful. Mr. E. C. McKinnon (Ghloride Electrical Storage Co.) said that maintenance charges, instead of being based on time, should take into account the number of charges and discharges. He considered the paper a little optimistic in that it dealt only with the first year's use of the battery, and was inclined to think that, on the whole, a heavier type of battery might have proved more durable. He made the valuable suggestion that a recording hydrometer should be used instead of the half-hourly reading taken at Manchester. Mr. A. M. Taylor (Birmingham Electricity Department) ran over Mr. Whysall's figures of saving due to the battery with enthusiasm, and seemed to think that the saving in coal bill alone, if capitalised, would even purchase another battery of equal size, which would save even more coal. Their battery at Birmingham worked out at a capital cost of £2 10s. per kw., and occupied  $1/20$  sq. yd. of floor space per kw. It was controlled by three double-ended boosters, which could be connected in series or parallel, or cut out by special switchgear. Finally, he commended the

use of batteries in conjunction with converters for stand-by purposes on A.C. schemes. Mr. Jacob thought that the comparative capital costs in the paper were to some extent vitiated by a ten-year period being taken for the battery and twenty years for the steam plant. He also thought that the relatively higher final scrap value of the battery should have been taken into account. Several other speakers, notably Mr. Fennel, deplored the shortness of the seven-year period allowed for battery loans by the Local Government Board. Experience with large batteries for railway work were dealt with by Mr. P. V. McMahon (Chief Engineer, City and South London Railway) and Mr. Roger T. Smith (Chief Electrical Engineer, Great Western Railway). The former showed some instructive load curves demonstrating the part played by his sub-station batteries, and the steadiness of the input to some of these sub-stations was confirmed by Mr. C. P. Sparks (Engineer-in-Chief, County of London Electric Supply Co.). Mr. Roger Smith gave some particulars of recent tests of the effect of the G.W.R. sub-station batteries. A maximum load on the generators (3 sets) of 2,720 kw. at a load factor of 58 per cent. with the batteries in action corresponded to 3,870 kw. (5 sets) without batteries at a load factor of 41 per cent. The most economical proportion of the load to be dealt with by the batteries was from 15 to 20 per cent., and with large traction loads, plant-load factors of 85 to 95 per cent. could be reached. The presence of a battery also allowed lighting and traction to be taken off the same H.T. bus-bars with a voltage within 4 per cent. If they had not put in batteries they would have needed 66 per cent. more steam plant and 13½ per cent. higher steam consumption. Mr. Sparks regarded the sub-station as the proper place for a battery, although there were special reasons for putting it in the generating station at Manchester. Great difficulties were introduced by the rapid growth of the load, which soon made a battery too small.

### THE BRITISH ELECTRICAL AND ALLIED MANUFACTURERS' ASSOCIATION

THE report of the Council of the British Electrical and Allied Manufacturers' Association for the year 1912 was presented on Friday afternoon last. There were 109 members on the register at the close of the year—an increase of fourteen since 1911.

The report states that the text of the general conditions of contract most commonly in use by engineering purchasers has been very thoroughly amended. Agreement is hoped for between the Association and the kindred bodies. Printed copies of certain vital clauses can be obtained from the Secretary. Copies of the complete text will be available shortly. A scheme by which sub-contractors would tender direct to the purchaser has been devised, and is embodied in the Cross-Tendering Agreement. The Committee dealing with the revision of standards for electrical machinery had completed its investigations on standard pressures and frequencies, high potential tests, classification of machines, rating, overloads, and heating. The findings will shortly be presented to the Engineering Standards Committee. The Committee on Electrical Accessories will also present recommendations to the Electrical Accessories Section of the Engineering Standards Committee. The National Insurance Act, particularly Part 2 relating to unemployment insurance, threw a considerable amount of work upon the Association, and the Secretary attended on several occasions before, and otherwise communicated with, the Umpire, and argued cases on behalf of members, securing in several instances the exclusion of certain branches of the industry. A new Railway Bill was proposed by the Government, but was dropped in favour of a short one-clause Bill. A Bill to extend the present powers of municipalities under the Electric Lighting Acts was promoted by the I.M.E.A., and may be passed in a form agreeable to the conflicting interests. Arrangements are on foot for the formation of a Joint Exhibition Committee, composed of representatives of the Association, of the I.M.E.A., and the Supply Companies. The Railway Companies having made alterations in their rates and in the method of packing goods, a deputation of the Association in respect of the carriage of switchgear will shortly visit the Railway Clearing House. The carriage of electric heating-stoves has already been dealt with. The points of difficulty in both cases may shortly be settled. A Joint Committee of the Association and the Contractors' Association is now discussing rules to govern the relations between members of the respective Associations. The question of the usefulness of the existing trade directories is under consideration. A contribution of £250 has been made to the Electrical Trades' Benevolent Institution.

The annual dinner was held in the New Banqueting Hall of the Savoy Hotel last Friday evening. Lord Ampthill, President of the Association, occupied the chair. The number of members and guests present was at least three hundred.

The toast of the British Electrical and Allied Manufacturers' Association was proposed by Mr. Samuel Insull (President, Commonwealth Edison Co., Chicago). He spoke of the lack of co-operation between electrical manufacturers and supply authorities in this country. In the United States and Canada the closest co-operation between the two sides of the business and a regard for the interests of the consumer was practised. London, with a population of 7¼ millions, uses 750 million units a year, whereas Chicago in 1912, with a population of only 2¼ millions, generated 800 million units.

Mr. A. Bruce Anderson (Chairman of the Council), who replied, speaking of the achievements of the Association, said that where it had been necessary for them to speak for one individual or for the whole Association, they had always been heard with consideration. The Association had had a remarkable growth, due to their endeavour to establish a spirit of reliance, without impairing the old spirit of self-reliance. The committees endeavoured to work for the benefit of everyone. Mr. Anderson then paid a tribute to the organising ability and never-failing tact of their secretary, Mr. D. N. Dunlop. This year they had, he said, been fortunate in obtaining the services of Lord Ampthill as president. In proposing the toast of British industry, Mr. L. Worthington Evans, M.P., spoke on the very necessary co-operation between Capital and Brains, and the necessity for enough capital remaining at home. The lack of development in the past could be rectified by more co-operation between the different interests. The tendency of present-day trade was towards combination in all departments.

Lord Ampthill replied. He was, he said, like a casual labourer on odd classes of public work. There was a time when England was the workshop of the world—Mr. Cobden thought it always would be; but as other nations had not seen fit to copy our methods, we ought to adapt ourselves to theirs. Government schemes did not do anything to promote British industry. He likened the B.E.A.M.A. to a trade union, maintaining a right for a "fair reward for their labour." The remedy for the present unrest was, he said, social reform in the form of "work" obtained by a far-sighted promotion of British industry. In his reply to a later toast, "The Chairman," he said that in olden times the "figure head" was often used as a battering-ram, and, if they wished, the Association was at liberty to use him as such.

Dr. S. Z. de Ferranti (Vice-president), in proposing the toast of the kindred institutions and guests, took the opportunity of reminding those present that the Institution of Electrical Engineers has now taken on the duty of looking after industrial interests. Mr. Insull was a great benefactor for showing what wonderful results could be obtained by co-operation. Thus similar failures to that of the Rand Power scheme could be avoided in future.

Mr. W. Duddell, F.R.S., and Col. Sir N. J. Moore (Agent-General for Western Australia) responded. Mr. Duddell said that if we compared the "Kindred Institutions" *per capita* instead of the energy used *per capita*, we would find that this country was far ahead of any other in the world. It would be a good thing to evolve some scheme for the co-operation of the institutions. Col. Sir N. J. Moore dealt with our Colonial trade as improved by preferential tariffs.

Mr. Hugo Hirst (vice-president), in the course of a speech proposing the toast of "The Chairman," said that when the whole country co-operated, then the manufacturer could appear in foreign countries as a strong and not as a negligible unit. If they gave Lord Ampthill the work and material, he would see that they got their rights in the long run.

An excellent programme of music enlivened the proceedings.

**The I.E.E. Library.**—It was announced at last Thursday's meeting of the Institution of Electrical Engineers that the Council have decided to render their large collection of electrical books of greater use to the membership by forming a lending library. The details are under consideration, and as soon as the scheme has been organised members will receive notice of the methods to be adopted.

**High-Tension Transmission on the Panama Canal.**—A committee has been appointed to review the plans for a high-pressure transmission line across the Isthmus of Panama, to consider the possible disturbance to signal systems, the probability of the future electrification of the Panama Railway, and to make recommendations relative to the best and most economical construction to be employed.

**Manchester Electro Harmonic Society.**—This society is making extremely good progress, and a feature in which it differs from the Electro Harmonic Society of London is the inclusion of a very considerable amount of highly classical music in the programmes of some of the concerts. Last Friday's concert was one of these "classical" evenings, and about 200 were present. Mr. Dorman (Dorman & Smith) was in the chair. At the conclusion of the concert Mr. Fred Sells (Director, General Electric Co.) proposed a vote of thanks to the Chairman in a few well-chosen words. Such reunions of members of all sections of the industry cannot fail to promote an *esprit de corps* and to foster a spirit of co-operative effort. It is to be hoped that similar societies will be formed in other large industrial centres in the provinces.

### THE MYRIAWATT

A JOINT committee of the American Institute of Electrical Engineers and the American Society of Mechanical Engineers has adopted resolutions in favour of the term "myrowatt," or "myriawatt" (10,000 watts), as a unit of thermal or mechanical power in dealing with the performance of boilers, steam and gas engines, engines and turbines, and the discontinuance of the use of the term "boiler-horse power." This latter unit, which appears to be in more general use in America than here, is considerably different than the ordinary horse-power, and the myriawatt would be only 2 per cent. larger. The official abbreviation suggested is *mw*. The inconvenience of rating the input to a generating set in "boiler-horse-power" and the output in kilowatts is rightly pointed out, and the remedy proposed is to express the input in myriawatts and the output in kilowatts. Those who were accustomed to think in the ordinary horse-power of 746 watts, and not in the larger units, will perhaps not see the necessity for the proposed new input unit of ten times the value of the output unit, and would prefer the further step of expressing both input and output in kilowatts. The suggestion was originally due to Mr. H. G. Stott, and was brought before the "prime movers" committee of the International Electrotechnical Commission at their meeting this month at Zurich by Mr. C. O. Mailloux.

### EXTENSIONS AT THE BLACKBURN ELECTRICITY WORKS

PART of the new plant which forms the latest extension at the Jubilee Street Works of the Electricity Department of the County Borough of Blackburn was formally inaugurated by the Mayor on Friday last. Of the two turbo-alternators forming the extension the one then "started up" has already been on load but has not yet been officially tested, while the second one is on its bed with the exception of the alternator, which is expected early in February.

Each set is capable of giving an output of 2,000 kw. under continuous working conditions, and runs at 3,000 r.p.m. They have been manufactured by the British Westinghouse Electric and Manufacturing Co. (Trafford Park, Manchester). In addition to the usual fittings, &c., a small automatic steam-driven oil-pump is provided for flushing the bearings before starting up; a Lea recorder is also provided for each set, and a Triplex Fournier recorder for giving temperatures of condensing water inlet and outlet, together with the extraction water. Steam is taken at 180 lb. per sq. in.

The condensers, designed for 190,000 gallons of cooling water per hour, are fixed directly under the turbine and are of the Leblanc type, each with its own Leblanc air-pump driven by a small vertical turbine exhausting into the low-pressure end of the main turbine. The steam supply to the auxiliary turbine is arranged for starting up from the main platform of the turbine, so that it is not necessary in case of emergency to go down into the basement to start up the condenser. The water for the condensers will be taken either from a tank over the boiler-house, direct from the reservoir, or from a cooling tower, supplied by the Davenport Engineering Co. of Bradford, capable of dealing with 200,000 gallons per hour, which is in course of erection. The pumps for the latter are being supplied by the Rees Roturbo Co., Wolverhampton, and the water-piping by the Stanton Iron-Works Co., and the work of laying the pipes is being carried out by the Electricity Department.

The alternators generate three-phase alternating current at a pressure of 6,600 volts with a periodicity of 50 cycles per second. The rotors are of the two-pole cylindrical type with Prof. Miles Walker's patent compensated windings, and with fans attached for ventilating purposes which draw the air by means of ducts from filters fixed outside the engine-room through the windings of the machine, and the warm air can then, by means of a plate placed on the top or bottom of the alternator casting, exhaust either upwards into the engine-room or downwards into the basement. Two 800-kw. Westinghouse rotary-converters with transformers have been fixed adjoining the turbines, capable of supplementing the existing 440-500 volt direct-current supply for lighting, power or

traction purposes. These run at 600 r.p.m. and are started up from the direct-current bus bars, and can be run inverted for extra high-tension loads when the turbines are not working.

The whole of the new switchgear was provided by the British Westinghouse Co. The extra high-tension control board is fixed in the main gallery, and is of the electrically operated remote-control desk-type, divided into nine panels made up of two turbo panels, two rotary-converter panels, four feeders and one bus-bar coupler. Two rotary-converter direct-current control boards are also fixed in the main switch-room, on which are fixed throwover switches for supplying the lighting or traction bus bars. The extra high-tension switchgear is built up in brick cubicles in a special room in another building situated about sixty yards from the control desk. Already four feeders have been laid to two mills situated a mile-and-a-half and half-a-mile distant respectively from the works, the demand from which will ultimately exceed 1,000 kw., and arrangements are now well in hand for further extensions to supply another 1,000 kw. demanded by several engineering concerns.

The extensions carried out have been designed and the installation of the plant carried out to the specification and under the supervision of Mr. P. P. Wheelwright (Borough Electrical Engineer). The new plant completes the possibilities of giving further supply from the present generating station, as the limit of the supply of water for condensing purposes has been reached and in the very near future another generating station will have to be built where coal can be delivered by rail or canal and better provision for water is possible.

**Day Students' Union Magazine, Northampton Polytechnic.**—We have received a copy of the first issue of a new magazine which has been established by the Day Students' Union of the Northampton Polytechnic Institute (Clerkenwell). The objects of the Students' Union are set out in an article, and the technical contents include abstracts of Papers read before the College Engineering Society on electrical instruments and locomotive valve gears, as well as articles on efficient lighting by Mr. W. H. Date, and on wireless telegraph systems by Mr. C. M. Dowse, together with a considerable amount of institute news.

**Institution of Electrical Engineers.**—The following is the result of the ballot for new members and transfers from one class to another at the meeting on Thursday:—*Members:* J. C. Smith, J. J. Stewart. *Associate Members:* J. Allan, A. Aspinall, C. T. Astbury, F. Birch, J. W. Burleigh, H. T. Byford, G. Cardwell, A. Clark, H. Cochrane, W. R. Cooper, H. T. Cort, W. J. Cross, E. L. Eastgate, F. T. C. Emberton, F. A. Fitzpayne, F. M. Fletcher, L. V. Fox, W. C. Fripp, E. A. Gatehouse, W. P. Gauvain, W. Grant, G. W. Harris, S. T. Jameson, E. C. Jennings, W. Lawson, W. C. Moore, R. L. Morrison, E. Müller, J. C. Murray, W. F. T. Pinkney, J. T. T. Randles, C. C. Rattey, A. R. Reeves, H. N. Rodgers, C. W. Salt, H. R. Schultz, R. Scrivener, W. Shead, F. G. Shrewsbury, B. H. Smith, G. H. Spittle, H. E. Street, G. Sykes, W. E. Turner, R. Weaving, T. Welch, F. H. Wigner, D. M. Williamson, P. Wood, W. Wood. *Associates:* H. L. Downes, Sir H. Norman, P. F. Rowell, E. Sinkinson. *Graduates:* W. H. Griffin, C. C. Higgins, S. B. Howard, T. W. Howard, G. E. Pearson, S. C. Potts, E. B. Roscoe, U. P. Roy, J. O. Spong, D. G. Thomson, J. W. Treherne, T. E. Ward, W. M. Wyatt. *Students:* J. T. Bedford, A. E. W. Butler, V. L. F. Davis, A. H. Deimel, E. Edminson, F. Frost, W. Gwemap, H. V. Higby, H. Honey, G. A. Keith, R. G. Kilburne, H. W. Looker, A. T. Mahon, V. H. Maurel, J. H. Meacock, J. N. Metcalf, A. K. Motawi, S. E. Pritt, J. Renton, H. Riley, B. S. S. Rockey, J. R. Rutherford, M. Sadick, C. S. Sarkar, C. A. Smiles, H. R. Sparrow, L. C. Speed, A. F. Sykes, K. B. Taylor, H. R. Tuppen, R. H. N. Vaudrey, C. N. Vernon, A. J. Waugh, S. B. West, G. B. Whitaker, A. Willcock, C. V. C. Wright. *Candidates Transferred:* *Associate Member to Member:* F. A. Bond, P. V. Gray, J. Josephs, F. E. Kennard, W. L. Maxwell, A. J. Mayne, F. S. Robertson, L. A. Smart, R. Stanley, G. Stevenson, H. D. Symons, J. P. Tierney, R. N. Torpy, W. B. Woodhouse. *Associate to Member:* F. H. Clough, E. H. Freeman, C. W. Neele, D. T. Powell, J. B. Shield. *Associate to Associate Member:* G. Bradwell, E. G. Brown, H. Dean, A. Eddington, T. Gillies, A. C. Gilling, F. C. Knowles, P. W. Paget, T. G. Smith, F. T. Wright. *Associate to Graduate:* L. O. Monson. *Student to Associate Member:* D. Betts, V. F. Bush, W. E. Flower, D. Harrop, H. F. Jefferson, L. W. Johnson, R. O. Kapp, H. Kingsbury, A. Lewin, P. T. Maybury, E. Orloff, J. H. Palmer, G. C. C. Sharples, B. S. Smith, H. A. Stewart, G. H. Taylor, M. O. Teague, R. A. S. Thwaites, L. N. Vine, A. G. Warren, J. Warren, E. Whitehouse. *Student to Associate:* H. Greenwood. *Student to Graduate:* M. B. Baker, E. G. Bowers, W. Bridger, W. G. Conner, A. D. Mackinnon, R. W. Manifold, J. Miller, R. A. Nuttall, D. V. Oppenheim, D. E. Parton, A. C. Smith.

## CONDENSING PLANT

A PAPER by Mr. W. A. Dexter, entitled "Comparative Notes on Independent Steam Condensing Plant," was read on Jan. 15th at a meeting of the Yorkshire Local Section of the Institution of Electrical Engineers. For low-speed reciprocating engines, the attached condenser with the air pump driven from the crosshead was favoured. In such work a vacuum of about 26 in. is sufficient, or for high-speed engines 26½ in., but for steam turbines, especially of the low-pressure type, a high vacuum is really essential. Even here, however, it is possible to aim at too high a vacuum for overall efficiency where there is not a good supply of cooling water at low temperature.

In the course of his general description of surface condensing plant, the author referred to the liability to corrosion of condenser tubes by local electrolytic action, stray electrical currents, &c. It requires only very slightly acidified condensing water to convey these electrical currents from one part of the tube to another. This trouble had been found most prevalent where cooling towers were used. Curves were given of good allowances of temperature difference for various inlet water temperatures and vacua. Thus, for 28 in. vacuum, inlet water temperature 75°, the temperature differences would be 7° F., and with water at 50° it would be 17° F. Considerations of the proportions of air and vapour in the condenser suggest a conical or peg-top shape for a surface condenser, or, considering the disposition of the tubes, a condenser, the cross-section of which is wedge- or pear-shaped, arranged longitudinally, so that the tubes are of equal length. The steam inlet branch should be large and follow the contour of the top part of the condenser body. Directing plates may be fitted to direct the steam equally over the whole surface of the tubes; the air and uncondensed vapour should, as near as practicable, be drawn off equally from the full surface of the tubes at the outlet end. If the water of condensation, or condensate, is withdrawn by a pump separate from that which deals with the air, and is to be used for feed purposes, it should be removed at as high a temperature as possible consistent with the vacuum desired. If, however, one set of pumps is used to deal with both air and water, then it may be advantageous to cool the condensate by allowing it to submerge a few of the bottom rows of tubes. Special means for obtaining high rates of heat transmission, such as cores to break up the flow through the tubes may be used, but there are objections to these devices. The best diameter for the tubes depends on the conditions of the water supply. With very clean water a ¾ in. tube may be used, but where the water is dirty it may be necessary to increase the diameter to one inch or even more. Where the water contains a large amount of foreign matter a jet condenser is admirable.

The jet condenser is cheaper than the surface condenser, but generally requires more power for the pumps. In the low-level type the injection water is usually drawn into the condenser by the vacuum, but it is necessary to withdraw it by a pump. A separate pump should be used for dealing with the incondensable gases. In the barometric type it is necessary to pump the water into the condenser, but no pump is required to extract it. The pumping power will be smaller than with the low-level type, as the full effect of the vacuum can be utilised in raising the water. The design of low-level jet and barometric condensers is similar. In practically all cases the water enters at the top and is discharged at the bottom of the condenser. Reference is given to a cylindrical shape with the axis vertical.

The paper then passes on to a consideration of the volume of air for which airpumps should be designed. For example, for a single turbine and attached condenser for a vacuum of 27 in., barometer 30 in., an actual air displacement of 0.175 cub. ft. per lb. of steam should be allowed. The well-known Edwards and Wier pumps were described, as well as a dry air pump of the Mirlees Watson Co., in which the inlet of the air to the cylinder is controlled by the mechanically operated slide-valve, and the ports are so arranged that when the piston reaches the end of its stroke communication is made between the two ends of the cylinder, allowing an equalisation of pressure. This obviates the losses due to clearance space. The air is discharged through non-return valves fixed on the back of the slide-valve. A full description was also given of the Leblanc rotary air pump which is now coming so much into use, especially for the high vacuum required for turbines.

In the concluding portion of the paper a number of actual installations were described by aid of a series of excellent general-arrangement drawings.

In the discussion, Mr. R. H. Campion (Borough Electrical Engineer, Dewsbury) suggested that corrosion of condenser

tubes was often due to bad tubes thrown on the market by the stringency of Admiralty specifications, as well as the acid condition of the water. He thought that the author was rather severe upon the pit condenser, and he did not regard the danger of flooding of low-level plants which had been referred to in the paper as serious. In replying, Mr. Dexter recommended the addition of a certain amount of lime to counteract acidity in the cooling water, and mentioned a case where he had even found an electrolytic deposit of copper at the bottom of a cast-iron casing. Mr. A. E. L. Scanes (British Westinghouse Co.) did not quite agree with Mr. Dexter's figures of temperature differences and vacua, and thought that it was never necessary to exceed 15° F. Deflecting plates, in his opinion, resulted in an appreciable loss of vacuum. Low-level jet plants with Leblanc air pumps were quite free from danger of flooding. Mr. McLay (Leeds) regarded as the common-sense way of building condensers bringing in the steam at the bottom, passing it up, and taking the air off at the top and the condensate at the bottom, an arrangement which Mr. Dexter agrees with in principle, but found difficult to follow with turbine plant.

## THE "TRICITY" SHIP HEATER

ELECTRIC heating for cabins, saloons, &c., on board possesses manifest advantages over other methods, and the special form of electric heater for the purpose which has been brought out by the British Electric Transformer Co., Ltd. (Hayes), in collaboration with Archibald Watson & Co., Ltd. (Glasgow), will be of interest to shipowners and others. The aim has been to produce a strong, non-luminous heater with no lamps to renew, no fine wire coils, and working at a low temperature, precluding any danger from fire or risk to passengers in confined spaces. The heater unit consists of a strong, heavily webbed, cast-iron grid, containing the

PEDESTAL FORM OF HEATER.

"Berry" Patent element, giving an effective heating surface of about 4½ sq. ft. This grid breaks up the air particles to give the best heating of the air by convection. The grids attain a temperature of about 500° F. in about fifteen to twenty minutes, at a consumption of 250 watts, and the apparatus is covered by an ornamental cover or guard, to form the funnels for the heated air. The heaters are made in the pedestal form illustrated in a modified design for attachment to bulkheads, or in an inclined pattern for fixing in groups under settees, &c., with a headroom of only 8 in.

## THE "POINT FIVES"

AT a meeting of the "Point Fives" (which, as many of our readers know, is an association of managing engineers of public electricity supply undertakings which charge one halfpenny per unit for heating, cooking, and other domestic uses, either as a flat rate or in addition to a reasonable fixed charge), a formal code of rules was adopted as to procedure for election of members, meetings, &c. Mr. W. H. Cooke (Luton) was in the chair. There are to be four meetings a year, including one during the I.M.E.A. convention, and the members are to take the chair in rotation. Visitors will be admitted. The next meeting is to be held at Bradford, with Mr. T. Roles in the chair. Mr. Cooke gave an address in which he advocated the standardisation of a compact, reliable, and low-priced complete cooking outfit, which would meet the requirements of the average family of six to eight persons. He suggested that the society should adopt a standard specification for a complete cooking outfit, and arrange with the manufacturers for the purchase of a certain quantity over a given period, and he submitted a draft specification. After this complete outfit had been standardised, the society could turn their attention to the standardisation of other articles for cooking and heating.

# QUESTIONS AND ANSWERS BY PRACTICAL MEN

## RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelopes.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,324.

What is the best method to follow in the construction of a generator for use in connection with a Tirrell or other voltage regulator, where wide variations in the load take place, and where these are sudden and frequent, and sometimes of very short duration?—B. T.

(Replies must be received not later than first post, Feb. 6th.)

### ANSWERS TO No. 1,322.

Show the relative current values, &c., in the transformer windings, motor, and mains of two auto-transformers "V" or open-delta connected, and used for starting a 3-phase, 3-wire motor by means of 60 per cent. voltage tapping. Also show why these transformers must have a total capacity of 115.6 per cent. when compared with 3 star-connected transformers used for the same purpose.—A. J.

The first award (10s.) is given to MATT for the following reply:—

The currents in the windings of the induction motor and in the leads will be identical whichever method of connection is employed for the transformer, and will be determined by the electrical design of the motor and the percentage of voltage applied. "A. J." does not give sufficient particulars to determine the actual currents, but probably the momentary current rush on a 60 per cent. voltage tapping would be about  $1\frac{1}{2}$  times full-load current in the line. Since the losses and magnetising current of the transformer will be quite small compared with the motor current, they may be neglected to simplify the explanation, i.e., we will assume the input and output of the

FIG. 1.

FIG. 2.

FIG. 3.

transformer to be equal, also that the current in each line between transformer and motor is in phase with the current in the corresponding line of the supply mains. Both these assumptions are very nearly correct. The following simple explanation will apply both to the initial rush of current and to the steady current when the motor has run up to speed.

First consider the V-connected transformer. Since the motor constitutes a balanced load, the currents will be equal in each phase. Call the phase current in the supply mains C, and the voltage between phases V. Then the transformer input is  $\frac{1}{\sqrt{3}}$  C V. Since the transformer secondary voltage is 0.6 V, neglecting losses (as explained above), the current in the motor leads will be 1.67 C. Referring to Fig. 1, the current in C B must evidently be the line current=C. Since this is in phase with the current in B D, it will supply 60 per cent. of it, and the remaining 40 per cent. (=0.67 C) must flow in the winding O B. In the vector diagram (Fig. 2), O B, and O E, are the currents in O B and O E. Since these are 120 deg. out of phase, their resultant O F, = O B, = 0.67 C. This resultant will be in phase with the line current A, O, and added to

it will give the current A, F<sub>1</sub>, which is 1.67 C, i.e., the current in the motor lead O F. Now the voltage across O B=0.6 V, and across B C=0.4 V. Hence the k.v.a. rating of this leg of the transformer will be  $C \times 0.4 V + 0.67 C \times 0.6 V = 0.8 CV$ . The same reasoning will apply to the other leg, giving a total rating of 1.6 C V for the transformer.

In the case of the star-connected transformer (Fig. 3), by similar reasoning it will be seen that the current in A A<sub>1</sub>=C, and therefore that in O A<sub>1</sub>=0.67 C, also that the voltage across O A =  $\frac{1}{\sqrt{3}}$  V, that across O A<sub>1</sub> =  $\frac{0.6}{\sqrt{3}}$  V, and across A A<sub>1</sub> =

$\frac{0.4}{\sqrt{3}}$  V. Hence the k.v.a. rating of each leg of the transformer

is  $0.67 C \times \frac{0.6}{\sqrt{3}} V + C \times \frac{0.4}{\sqrt{3}} V = \frac{0.8}{\sqrt{3}} CV$ , and the rating of the

whole transformer is  $3 \times \frac{0.8}{\sqrt{3}} CV = 1.385 CV$ . Therefore the

rating of the V connected transformer =  $\frac{1.6}{1.385} = 1.156$  times that

of the star-connected transformer.

From the foregoing it follows that when the transformer is in circuit, the current in the leads between transformer and motor is at all times 1.67 times the current in the supply mains. The makers of the motor can doubtless advise "A. J." of the initial current, and the steady current at any load of the motor when running on a 60 per cent. voltage tapping. The currents in the motor windings themselves will be the same as those in the leads between transformer and motor if the motor is star-connected, and  $\frac{1}{\sqrt{3}}$  times this value if the machine is delta

connected. The currents in the transformer windings have been dealt with above.

The second award (5s.) is given to "H. S." who writes as follows:—

Fig. 4 gives the connections diagrammatically. Let I = current in motor leads. It will be practically the same in each, and let V = voltage between each pair of motor leads. Then, as the transformers have a 60 per cent. tap, the line voltage =  $\frac{100}{60} V = 1.67 V$ .

The line current can be obtained by considering the auto-

FIG. 4.

FIG. 5.

transformer across one phase. It will bear to the motor current the same relation that the motor voltage bears to the line voltage, that is, line current =  $I \times \frac{V}{1.67 V} = 0.6 I$ .

The line currents will be balanced. The currents in the windings AB and A'B' are the line currents. The currents in the windings BC and B'C' are the difference between the motor and line currents. Or current in BC =  $I - 0.6 I = 0.4 I$ . To obtain the capacity of the arrangement, multiply the voltage across each winding section by the current in that section, and add the products. This gives us capacity = 1.67 VI.

Fig. 5 shows the arrangement of 3-star connected auto-transformers. Denoting by I and V the same quantities as before, and proceeding as above, we obtain for this arrangement capacity = 1.39 VI.

∴ capacity of "V" connected =  $\frac{1.67 VI}{1.39 VI} = 115.6$  per cent.

**Answers to Question No. 1,321.**—Owing to a clerical error, the estimated consumption of oil was given in the first reply as  $\frac{1}{4}$  to 1 pint per B.H.P.-hour. This should have been 1 to  $1\frac{1}{4}$  pints.

## ANSWERS TO CORRESPONDENTS

A. V. JONES.—(1) Putting the coils in parallel in the way you suggest would not reduce the flux, but would probably damage them. A resistance would have to be used in series in any case, and the coils had better be kept in series. (3) Probably the leading electrical contractor in your district could recommend a pattern of heating element on seeing the

hot plates of your printing machinery; we do not know of a book that would meet your requirements. (2) The contractor could advise you at the same time as to the amount of power necessary to drive your machinery, or if you are thinking of hiring a motor, the Corporation Electricity Department would advise you as to the size required. Tables of the approximate power needed to drive different classes of machinery are to be found on page 76 of the "Mechanical World" Electrical Pocket Book for 1913, a copy of which we can send you for 8d. (post free).

### THE INDRA SYSTEM OF LIGHTING

WE are informed by the Electrical Engineering and Equipment Co., Ltd. (109-111 New Oxford Street), that they have now acquired the patents for the "Indra" system of lighting, and are putting the fittings for this on the market in this country. The arrangement is different in principle from the various indirect and semi-indirect methods which have now become so popular, but has similar objects in suitable distribution and avoidance of glare. With the "Indra" system of lighting, the actual source of light is not seen, yet the bulk of the light is directly reflected through clear glass. A simple fitting consists of a combination of specially designed upper reflector and lower distributor. The upper reflector is preferably of opal glass, but, in some cases, where the whole of the light is required in a downward direction, an aluminium reflector is supplied. The lower plate (as seen in Fig. 1) is provided with alternating rings of clear and etched glass. The etched glass rings are at right angles to the direct rays emanating from the lamp, and are of translucent or etched glass, while the clear glass rings are arranged in such a manner that the rays of light reflected from the top reflector pass straight through. By this means many of the advantages of

FIG. 1.—SECTION OF REFLECTOR AND SHADE.

FIG. 2.—COMPLETE "INDRA" FITTING.

indirect lighting are obtained without its loss. No dust can collect in the fitting, and a very much greater efficiency is obtained. As is well known, the bulk of the rays of light from metal filament lamps emanate at right angles to the filament. These rays strike the reflector and are directed through the clear glass rings of the distributor. The rays which strike the distributor direct are diffused through the translucent or etched surface glass rings, so that a very high general illumination is secured without eye strain. From photometric tests it has been shown that the light is greater when the "Indra" fitting is used than that from an ordinary lamp with reflector, the eye is not blinded by the brilliant glare, and the general illumination is improved. The fittings

are made in a number of forms, one of which is shown in Fig. 2. They can be supplied to focus the light in a given spot or spread it over desired areas, or to give a general illumination, and are made up in various designs suitable for banks, railways, theatres, public buildings, stores, offices, and private house lighting. The fittings are supplied in various sizes from 8 in. to 20 in., and are suitable for metal filament lamps having candle-powers ranging from 50. to 1,000.

### PORCELAIN HANDLE FUSES

THE accompanying illustration represents the latest improved pattern of porcelain fuse handles which are being manufactured by A. Reyrolle and Co., Ltd. (Hebburn-on-Tyne). It will be noted that these are not now fitted with buttons on the front as formerly. On the earlier design of self-aligning fuse handle the bolt which secured the contact to the porcelain was carried through to the front of the porcelain, and a porcelain button was screwed over the

NEW DESIGN OF PORCELAIN HANDLE FUSES.

shank. There was a possible disadvantage in this design, inasmuch as there was always the danger of the porcelain button being broken, although the Company assure us that they have never had a case brought to their notice. In order to obviate any objection on this account the porcelain is now made solid, and the bolts securing the contacts are screwed into nuts let into the porcelain. Even in the smaller sizes there is not less than about half an inch of porcelain between the hand and the live metal.

### A NEW FOLDING SCAFFOLD

MESSRS. J. H. HEATHMAN & CO. (Parson's Green, Fulham, S.W.), have sent us particulars of a new pattern of very convenient telescopic folding scaffold trestle, which can be stored in a very small space and easily carried about premises to the position where it is to be used. The ladder composing the trestle is set up on a base mounted on castors, forming a trolley, and is attached by set screws. The single-sliding vertical ladder forming the upper part is then adjusted to the proper height. The whole can be carried upon a barrow or cart, and is made in three or four sections, so that they may be used for very low as well as high rooms, and further, the ladders can be used quite independently of the trolley base to lean against walls, as three separate ladders to each set, or as self-standing trestles, while the trolley can be used for moving light goods. Two sets can be used conjointly with scaffold boards and protection rails, or one scaffold used separately, as circumstances necessitate.

**Tramways & Light Railways Association.**—The Annual Dinner and Smoking Concert will be held on Thursday, February 27th, and the annual Congress at Blackpool, probably on June 11th.

**The Society of Engineers (Incorporated).**—The Council announce that arrangements are being made for holding the Fellowship examination of the Society during the second week of June next. Intending candidates should apply to the Secretary of the Society, 17 Victoria Street, Westminster, S.W., for full particulars.

**Callender's Hospital and Distress Fund.**—We have received a copy of the tenth annual report of Callender's Hospital and Distress Fund in connection with the Belvedere Works. Contributions totalling £250 have been made to hospitals and other institutions out of the fund during the year, a large number of hospital letters, &c., and other assistance have been given.

# ADAMS IGRANIC

Adams M<sup>rs</sup> C<sup>o</sup> L<sup>td</sup> Balfour House, Finsbury Pavement, London E.C. Works-Bedford.

### ELECTRIC TRACTION NOTES

A considerable disorganisation of the London County Council tramway system occurred on Monday for about half an hour between 8 and 9 p.m., primarily caused by the breakdown of a high-tension feeder. At 8.25 p.m. a violent short-circuit occurred on the high-tension side, which was subsequently found to have been in the joint of one of the high-tension mains somewhat close to the Greenwich Power House. Although the relay on this feeder was set very closely at the time and operated in about four seconds, there was a very abnormal rise of pressure which brought down the bus-bar volts, stopping certain of the station auxiliary plant driven by induction motors, and at the same time shutting down 14 of the 24 sub-stations through the relays. By 8.40 everything was re-started and switched on again, but another serious short and surge took place, this time cutting out again 8 sub-stations. Everything, however, was finally got in order, and the supply permanently restored at 8.57 p.m. The surge was sufficiently serious to burn out five motor-generators in the sub-stations, which were comparatively old, and, therefore, not in quite so good a condition as the more recent ones to withstand the strain. The cable in question had been in service for about six years.

The London, Brighton & South Coast Railway Co. have definitely decided to extend their single-phase railway to that portion of their main lines running as far as Stoot's Nest on the East Croydon and Purley main line, and to Cheam on the Portsmouth main line. This involves the addition of 120 miles of electric line, and the conversion is to be carried out within four years. The work, however, will be completed in sections, and each section put into operation as soon as completed. This decision has been arrived at in view of the excellent results obtained from the short lengths of single-phase lines now being worked by the company. Power will, we understand, be supplied by the London Electric Supply Corporation as hitherto, and this will naturally involve large extensions at this company's Deptford station, which will make it one of the largest of the London power houses. Current for lighting the Norwood sidings, &c., is being supplied by the Croydon Corporation, who also now supply power to the railway repair shops in Croydon. In all probability, also, the station lighting will be arranged for locally, so as to be independent of the main power supply to the line.

Lieut.-Col. Sir H. A. Yorke has now presented his report on the "Tube" Railway collision which took place at Caledonian Road Station on the G.N.P. & R. Rly. on Sept. 4th, 1912. A Board of Trade inquiry was opened at once and was reported in our columns at the time: *ELECTRICAL ENGINEERING*, Vol. VIII., Sept. 12th, p. 508, and Oct. 24th, p. 586. Sir H. A. Yorke finds that the driver of the train which ran into a stationary train was not paying proper attention to his duties and ran past the signals when they were at "danger," that the train-stop was out of adjustment and had not fully resumed the danger position at the time the train passed. Also the trip-cock on the train was half an inch out of gauge. The signals were found to be working normally immediately before and after the accident. The evidence showed that the brakes on the colliding train were not applied until the moment before the accident. On investigating the allegations of signal failures at "clear" it was found that only one such case was on record (July 9th, 1910). This was due to broken copper bonds in the track circuit. Flexible copper is now used. There is no reason, says Sir H. A. Yorke, for suggesting that automatic signalling has proved a failure. It is the safest and, in fact, the only system whereby the dense traffic on the "Tubes" could be conducted. The fact that no telescoping of the coaches occurred is attributed to the fact that they are steel built.

The half-yearly report of the Great Northern & City Railway Co. shows that the net revenue was insufficient to meet fixed charges by £5,086, which sum has been provided from other sources. As already announced, the Company is seeking

Parliamentary sanction for the sale of the undertaking to the Metropolitan Railway Co., and the necessary meetings for obtaining the shareholders' sanction will be held after the half-yearly meeting.

It is anticipated that the electrical working of the East London Railway will be commenced in April.

A Sub-committee of the Aberdeen Tramways Committee is now considering the introduction of trolley omnibuses as supplementing the tramway system.

### TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The Government have lost no time in appointing a Committee of experts recommended by the House of Commons Committee which is considering the Imperial wireless telegraph scheme. The chairman of this Committee is Mr. Justice Parker, and the other members are Mr. W. Duddell, F.R.S., President of the Institution of Electrical Engineers; Dr. R. T. Glazebrook, F.R.S., Director of the National Physical Laboratory; Sir Alexander Kennedy, F.R.S.; and Mr. James Swinburne, F.R.S. The Committee have been requested to report as soon as possible, and in any case within three months, on the merits of different systems of wireless telegraphy. Possibly Mr. Duddell may not accept the nomination, as he owns the fundamental patent for the "singing" arc upon which the Poulsen system is based, but in the ordinary course this patent is due to expire next year after a life of 14 years.—Before communicating with the Marconi Co. as to their wish to regard the proposed contract as not binding upon them, the Committee have decided at first to hear Mr. Marconi and Sir Alexander Kennedy, and the Secretary to the Post Office, on the matter. They will possibly also ask the advice of the Solicitor-General.

The action of the Marconi Co. against Messrs. P. O. Goukassoff & Co., referred to in our last issue, came to an end on Friday, when judgment was delivered. Messrs. Goukassoff, who had a controlling interest in the Russian Telegraph & Telephone Co., agreed to give the Marconi Co. the first opportunity of purchasing the shares which they held, and the allegation was that this had not been done. At the conclusion of the evidence, Mr. Justice Scrutton offered Messrs. Goukassoff the opportunity of still handing over certain shares which would have enabled them to comply with certain agreements between the parties, but this had not been done, and damages were assessed at £6,000.

Mr. Wm. Aitken (Automatic Telephone Manufacturing Co., Ltd.) delivered an address on automatic telephones before the Western Local Section of the Institution of Electrical Engineers on Jan. 13th, in which he described the Strowger system. This was fully dealt with in *ELECTRICAL ENGINEERING*, Vol. VII., May 25th, 1911, p. 293, and Vol. VIII., May 23rd, 1912, p. 273. The author then gave some details of meters used on measured rate systems, space required, maintenance, &c., as compared with C.B. exchanges. As regards maintenance, recent experiments indicated a life of 30 to 50 years with little cost for renewals.

Mr. A. T. Kinsey (Assistant Superintending Engineer, P.O. Telegraphs, Bristol), Mr. B. Waite (District Manager, P.O. Telephones, Cardiff), and Mr. C. J. Youngs (P.O. Telegraphs, Cardiff) mentioned that with an automatic system there would be no favouritism to callers, no mistaken numbers, service always available, no overhearing of conversations, and no relays of assistants required. Mr. C. J. Youngs was inclined to question the life of the apparatus. His experience with polarised coin boxes was not very favourable. He understood that party lines had to be kept down to four, which was, in his opinion, a great disadvantage. Mr. J. H. M. Wakefield (P.O. Telegraphs, Newport) questioned the figures given for maintenance and the space taken up. It was impossible wholly to check the use of unsuitable tools in effecting repairs. Trouble might be anticipated with sticky relays and demagnetisation. Mr. Aitken (in reply) stated that the power required to work an automatic exchange was about 25 per cent. less than that required for a C.B. manual exchange of the same capacity (50 amp-hours per 1,000 lines per day at 48 volts). Figures from America showed that on an

## "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

### Specifications Published Jan. 23, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

29,083/11 and 15,031/12. **Cinematograph Targets.** B. W. BATES, H. W. KELLY, and D. H. CORBIN. The picture is projected on a perforated screen, the bullet hole being illuminated by a rear light. The film is stopped as soon as the shot is fired by a movable diaphragm in a sound collector near the gun, which completes an electrical circuit and brakes a controlling shaft. The machine is automatically restarted by a timing relay in the brake circuit. After every few stoppages the screen is automatically moved on a certain distance. Four figures each.

29,207/11. **Magnetic Separators.** KRUPP A.-G. A non-magnetisable ring is rotated round a fixed magnet and a rotating armature at the same or a different speed to the latter. Two figures.

29,223/11. **Temperature Regulation of Molten Metal or other Fluids or Solids.** L. WIGERT-STERNE. The invention applies primarily to stereotype metal. Solenoids controlling the position of air and gas valves are actuated by contacts in a pressure gauge communicating with the heated chamber. Three figures.

27,254/11. **Tumbler Switches.** J. H. WHYMAN. The switch lever moves parallel to the base plate. A flanged cover with no projections is secured to the base by a recess in the flange for engaging a spring on the case. The flange is sprung past the part on the base through which the lever works. Two figures.

86/12. **Wireless Receivers.** G. MARCONI and C. S. FRANKLIN. A series characteristic dynamo, with its magnetic parts unsaturated, is connected in series with a battery and a Fleming valve, carborundum, or other crystal detector. The dynamo at a certain speed causes the increase of current, which always takes place at a certain P.D. to become much more rapid. The strength of signals in the receiver is thereby greatly augmented, due to the increase in pressure produced by the incidence of a wave. The increase in current is only limited by the saturation current of the detector, but it does not decrease again on the removal of the extra applied P.D., so a second relay is inserted in the indicating circuit to break the dynamo and detector circuit as soon as the current in it is sufficient to work the first relay. Two figures.

387/12. **Heating Element.** E. TOWNSHEND. The resistor in the form of a wire is wound on a carrier of pipe-clay or similar material, which becomes red hot. Applied to a kettle, a disc carrier is enclosed within a casing lined with asbestos or uraltite, and attached to the under-side of the kettle, so that the pipe-clay carrier is in actual contact with the bottom of the kettle. Three figures.

2,456/12. **Directive Receiving Aerials.** MARCONI'S and C. E. PRINCE. The aerial consists of an unearthed closed circuit preferably arranged as a rectangle with two sides horizontal, and the receiver in the lower side, with tuning condensers. The wave-length should considerably exceed the base-line of the aerial. The maximum effect is obtained with waves perpendicular to its plane, and zero effect with waves in its plane. To determine the direction of a sending station two aerials set in planes at right angles are used, and the currents produced in each are compared or equalised. Two figures.

3,065/12. **Enclosed Flame Arc Lamps.** B. A. QUINT. A metallic chamber with external fins is arranged above the globe, in which the heated gases from the arc are cooled, and the fumes condensed on the walls. No tubes are required. Two figures.

13,780/12. **Self-contained Electric Vehicles.** P. MARINO. A hot-air engine on the vehicle drives a dynamo, whether the vehicle is stationary or moving, and charges accumulators which in turn supply energy to the driving motor. When moving, the live axle is connected through gearing to the hot-air engine, so that any excess power is transmitted back to the dynamo. Two figures.

17,393/12. **Coal Conveyor for Discharging Barges, &c.** P. H. SUISTED. Two figures.

### Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad. Summaries of some of the more important of these patents will appear in our next issue.

**Arc Lamps:** RIGBY [Hand regulated] 19,099/12; KORTING & MATHIESEN [Differential lamp with inclined carbons] 26,318/12, [Solenoid] 27,024/12.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** PECK and ECKMANN [Operation of D.C. motors] 1,365/12; BECKER [Decreasing capacity effects in cables] 6,061/12; DUSSAUD [Lighting apparatus] 8,087/12; EARL [Regulation] 11,871/12.

**Dynamos, Motors, and Transformers:** HINKSMAN [Magnets]

15,704/12; SIEMENS SCHUCKERT. [Sparkless commutation in rotaries coupled to A.C. boosters] 23,285/12.

**Electrometallurgy and Electrochemistry:** ASHCROFT [Alloys of light and heavier metals] 1,001/12, [Light metals and reaction products] 1,003/12, [Anhydrous caustic alkalis] 1,004/12, [Alkali metals] 1,005/12; STOBIE [Furnaces] 2,081/12; ELEKTRO-MAGNETISCHE GES. [Wet separation of ores] 10,619/12; HELBRONNER, VON RECKLINGHAUSEN, and HENRI [Sterilisation of milk] 14,835/12; SOC. GEN. DES NITRURES [Revolving furnace for manufacture of aluminium nitride] 16,406/12.

**Heating and Cooking:** BALLY [Transformer boilers] 16,043/12.

**Ignition:** BAUER and ECKMEIER, 9,492/12; FORRESTER (*Marshalltown Motor Material Mfg. Co.*) [Spark plugs] 12,809/12; ROTHSCHILD, 14,738/12; COOK [Igniters] 16,664/12; BOSCH [Auto-time adjuster] 17,029/12.

**Switchgear, Fuses, and Fittings:** DAY [Lampholders] 750/12; MARKT [Two-way switch] 4,498/12; B.T.-H. and HASTINGS [Controllers] 7,704/12; HOSFORD [Contacts] 13,432/12; WESSEL and GYSLER [Auto. elect. mag. cut-outs] 14,120/12; FARMER and KOHLSTEDT [Junction boxes] 16,622/12; MURRAY [Connections] 19,535/12; B.T.-H. (*G.E.Co., U.S.A.*) [Cable connectors] 25,775/12.

**Telephony and Telegraphy:** JOHNSON, VARLEY, MICHAELIS, POWER, and JOHNSON SECRET WIRELESS SYNDICATE [Printing telegraphs] 22,079/11; SOC. INDUSTRIELLE DES TÉLÉPHONES [Using power mains] 412/12; DERRIMAN (*Auto. Elec. Co.*) [Telephony] 687/12; DAWSON and BUCKHAM, 777/12; LOGAN [Telephone transmitter interruptors] 1,168/12; HAMMER [Telephones] 4,358/12; HENSMAN [Grapnel for raising submarine cables] 7,996/12; SIEMENS & HALSKE [Radiographs] 9,499/12; FEENEY (*Nat. Wireless Co.*) [High-frequency currents] 14,735/12; SIEMENS BROS. and PETITHORY [Cord plug holders] 21,946/12.

**Traction:** ICARD [Auto. block signalling] 5,352/12; BERGMANN [Trolley lines] 15,930/12; OERLIKON [Loco's, boats, &c.] 19,890/12.

**Miscellaneous:** VOGT [Clocks] 27,291/11; BEVILLE [Illuminated signs] 2,566/12; HALDEN [Photographic copying] 5,278/12; WHITTLE [Locking doors and starting mechanism for lifts, &c.] 9,352/12; BLATHY [Rotary magnets] 16,538/12; HUNT [Portable hand lamps] 17,850/12; WARD [Cinematograph accessory] 18,072/12; LE MAITRE [Targets] 28,260/12.

The following Specification is open to inspection at the Patent Office before Acceptance, but is not yet published for sale.

**Miscellaneous:** GAMPER [Facilitating packing of magnetic material] 28,233/12.

The following Amended Specifications may now be obtained.

**Distributing Systems, &c.:** W. E. LAKE (*U.S. Light & Heating Co.*) [Regulator for variable-speed generator] 9,365/11; CIE. INTERNATIONALE D'ELECTRICITE [Vehicle lighting from variable-speed generator] 21,364/11 (*void*).

**Miscellaneous:** VEIFA-WERKE and F. DESSAUER [Induction-coil regulator] 21,333/11 (*void*).

### Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

**Distribution Systems, &c.:** P. G. B. COLLYER [Lead or other non-corrosive casing for earthed wires] 22,500/06.

**Dynamos, Motors, and Transformers:** B. T.-H. and R. C. CLINKER [Booster series winding in series with transformer primary and in shunt with secondary] 21,902/04; B. T.-H. (*A.E.G.*) [Series motors. Series starting resistance connections] 22,203/07; J. E. NOEGGERATH [Brushes and holders for high-speed dynamos] 22,301/07.

**Ignition:** H. STYCZYNSKI and S. LINDA [Influence machine with condensers and igniting switch] 21,802/03.

**Incandescent Lamps:** W. E. LAKE (*G. Michaud and E. Delasson*) [Squirted metallic filaments: manufacture of and furnace for] 22,036/07.

**Switchgear, Fuses, and Fittings:** C. W. ATKINSON [Quick-break switch-fuse in interlocked case] 20,595/05; J. C. ETCHHELLS [Lift controlling] 22,465/06.

**Telephony and Telegraphy:** M. G. KELLOGG [Telephone exchange: divided multiple board quadrupling previous capacity—27 figures, 60 claims] 18,031/00; SIEMENS BROS. (*Siemens & Halske*) [Paper-perforating mechanism for automatic telegraph transmitters] 21,493/03; J. J. CHISWELL [Adjustable table telephone bracket] 21,966/07; H. S. MARTIN [Compound powder for microphone] 22,478/07.

**Traction:** B. T.-H. (*A.E.G.*) [Motor control by resistance in parallel with field winding] 22,131/07.

**Miscellaneous:** LORD KELVIN, F. W. CLARK, and KELVIN & JAS. WHITE [Ship compass suspension] 22,031/02; J. T. DAWES [Magnetic ore separators] 21,324/03; L. N. WILLIAMS [Electromagnetic lock for miners' safety lamps] 21,809/04; A. PHILIP and L. J. STEELE [Catalytic gas detector] 22,129/06.

average one man per 1,000 lines was required for maintenance. Automatics were cheaper than magneto boards, which were commonly considered to be cheaper than C.B. boards. He advocated leaving the adjustment of groups of contacts to individuals on account of greater uniformity, a matter of considerable importance. Although it was quite possible to operate as many as eight party lines on the automatic system, more than four was not recommended, as it was difficult to keep a sufficiently perfect state of insulation. A 2d. coin box was being experimented with. Constant voltage was very much more important than exceptionally good earthing.

The December issue of the *Telefunken Zeitung*, which has been sent us by Siemens Brothers and Co. (Woolwich), opens with some notes on the recent International Radiotelegraphic Conference and the conference on time signals in Paris, and contains descriptions of various forms of wireless equipment supplied by the Gesellschaft für drahtlose Telegraphie, including 1-kw. ship outfits, 5 to 20-kw. land stations, a thunderstorm indicator and military apparatus used in the Swedish cavalry manoeuvres. Other articles and notes deal with "Telefunken" installations in Siberia, Sayville (New York), New Zealand, and other parts of the world.

At Epsom the Postmaster-General has met with the somewhat unusual experience of being compelled to lay a telegraph line underground. The proposal was to erect poles across Bookham Common, but the County Court judge has made an order that the line should be laid underground.

At the House of Commons on Thursday, the Postmaster-General entertained at dinner a large number of those concerned with the Post Office case in the telephone arbitration proceedings.

## LOCAL NOTES

**Ashton-under-Lyne:** *Fire at Electricity Works.*—Some exaggerated accounts have appeared of a fire which occurred at the generating station last Thursday. There was certainly a fire at about 9 p.m., which could not be put out without the brigade, and which did considerable damage to the generator and other cables in the basement. It was found practicable, however, to restore the whole of the general supply, i.e., private and public lighting and power, all on the three-wire system, by midnight, and the traction and alternating supplies by 8.30 the following morning. The investigation as to the cause is not completed.

**Australia:** *New South Wales Power Scheme.*—Mr. W. Corin, Electrical Engineer, Public Works Dept., Sydney, has presented a report in which he recommends the establishment of a large power station on the southern coal fields in New South Wales as the commencement of a number of power stations in various parts of the city, from which a supply of electrical energy for all purposes will be given at very cheap rates. The scheme includes the utilisation of the State's water-power resources.

**Ayr:** *Lighting and Heating Tariffs.*—In consequence of an increase in the price of coal by 33 per cent., and the reduction in the demand for current owing to the use of metallic filament lamps, the Lighting Committee has recommended an increase in the flat rate for lighting from 3½d. to 4d. per unit, and a reduction in the price for cooking from 1½d. to 1d. per unit.

**Blackrock:** *Electric Supply.*—The Council have decided not to give their consent to the Dublin Southern District Electric Supply Co. to include their districts in the provisional order now being promoted by the company. It is felt that better terms can be arranged with the Pembroke Urban District Council than are offered by the company.

**Brighton:** *Electric Cooking.*—With reference to our Note last week as to the large electric cooking outfit which is being installed in the premises of Messrs. Staffords, the Electric Supply Committee arranged to provide this apparatus for free use until the end of twelve months, when Messrs. Staffords will pay the net cost, viz., £55, if satisfactory. Mr. Christie, the Borough Electrical Engineer, attaches great importance to having a large apparatus of this character on show, and confidently anticipates that equally good results will be obtained to those already given by the large number of small electric cooking outfits in use in Brighton. At the last meeting of the Council the proposal met with some criticism, but it was eventually agreed to.

**Dorchester:** *Electric Supply.*—The County of Dorset Electric Supply Co. anticipate being able to give a supply in May, and are endeavouring to arrange with the Council as to street lighting.

**Dundee:** *Electricity Works Extension.*—The Chairman of

the Electricity Committee and Mr. H. Richardson, Engineer and Manager of the electricity department, are to visit the principal engineering works on the Continent in view of the extensions to the electricity undertaking.

**Erith:** *Bulk Supply.*—We mention in our Tenders Invited column certain recommendations for dealing with the increasing demands upon the power station. At the same time the Woolwich Council have offered to supply in bulk, and the Town Clerk has been instructed to ask for the Woolwich Council's terms.

**Glasgow:** *Electrical Exhibition.*—A sub-committee has been appointed to consider the proposal made by a number of firms to organise an electrical exhibition.

**Knighton:** *Electric Supply.*—The ratepayers have discussed whether they shall undertake an electric lighting scheme or give facilities to a company, and their decision is in favour of the latter course.

**Lowestoft:** *Electric Lighting Loans.*—In his report upon the past year's trading, the Engineer calls attention to the increase in the interest and sinking fund charges due to the short loans now granted by the Local Government Board. He points out that whereas originally fifteen to twenty years were granted for certain plant, periods of only six and eight years are now allowed.

**Manchester:** *Trading Profits and Rates.*—A report by the Trading Profits Special Committee, which was presented as far back as last October, was again discussed at the special meeting of the City Council last week. The Committee fixed the percentages of profits from the trading departments of the Corporation, which it recommends should be paid over in relief of rates, and the contribution of the Electricity Committee is fixed at 1 per cent. upon the capital expenditure. The Committee's recommendation was that the various percentages should hold good for three years, but an amendment reducing this to one year was carried.

**Moffat, N.B.:** *Electric Lighting.*—A Committee has been appointed to go into the question of electric lighting, and to obtain expert advice.

**Pocklington:** *Electric Lighting.*—A meeting of ratepayers has passed a resolution urging the Council to enter into an agreement with Messrs. Crompton & Co. for the erection of an electricity supply works.

**Southampton:** *Electric Supply in Woolston.*—Two alternative schemes of supply in Woolston have been placed before that Council by the Corporation. The first one, that current shall be supplied at 2½d. per unit for lighting, and 1d. per unit for power and heating purposes, with a minimum of £200 on a 12 years' contract. In the second scheme these charges are reduced somewhat on condition that the Council provide the cables to the Southampton Corporation boundary from the various feed points.

**Watford:** *Extension to Bushey.*—Terms have been arranged for the supply of electricity in Bushey by the Corporation.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Egypt.**—Electric lighting installation at Damietta. Particulars from Sir A. L. Webb, K.C.M.G., Queen Anne's Chambers, Broadway, Westminster, S.W.

**Erith.**—The Borough Electrical Engineer has reported with regard to the general development of the electricity undertaking, and assuming that the Council does not desire to increase the present buildings, he recommends the replacement of the three small sets now in one part of the station by a 750-kw. reciprocating engine set. The probable cost of this, together with a rearrangement of the steam and feed mains, economiser, &c., is put at £12,000. This suggestion, however, he thinks, will only carry on the undertaking until 1914, and having this in mind he throws out the suggestion as to whether the time has arrived when it will be more advantageous in every respect to build a new power-house

FOR  
**STEAM JOINTS**  
USE

JOHN HUDSON & CO.'S SUCCESSORS, Mansell St., London, E.

on the river front, where the handling of coal and ashes could be more economically dealt with, and an unlimited supply of water would be available for condensing purposes, the present power-station would then be used as the main distributing point for the district. We refer to an offer for a supply in bulk by the Woolwich Council in our Local Notes column.

**Grimsby.**—A 1,000-kw. mixed-pressure turbine and continuous-current dynamo with condensing plant. Borough Electrical Engineer. February 11th. (See advertisement on another page.)

Mains extensions aggregating a cost of £200 have been sanctioned.

**South Africa.**—The Paarl Municipality propose to raise a loan of £34,465 for an electric supply scheme.

**Stalybridge Joint Board.**—The Stalybridge, Hyde, Mossley & Dukinfield Joint Tramways Committee require rotary converters.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Barking.**—Electric lighting and fitting of Ripple School. Architect, C. J. Dawson, 16 Cambridge Road, February 7th.

**Barrow-in-Furness.**—Council school, Hindpool. Borough Engineer.

**Cork.**—Cinematograph theatre, King Street. Architects, A. & H. Hill, 22 George Street.

**Coventry.**—Considerable extensions to public baths.

**Dartmouth.**—Isolation hospital.

**Dartford.**—Cinematograph theatre. Architects, Withers & Meredith, 50 Cannon Street, E.C.

**Falkirk.**—Sanatorium.

**Hyde.**—Electric lighting of public baths. Architect, J. H. Fletcher, 45 Clarendon Place.

**Penzance.**—New school.

**St. Helens.**—Council school in Liverpool Road. Architects, Biram & Fletcher, George Street.

**Swinton.**—All Saints' Church. Architects, Cunliffe & Heywood, John Dalton Street, Manchester.

### Miscellaneous

**Beckenham.**—Annual supply of house service boxes, cut-outs, flame arc lamp carbons, &c. Town Clerk, February 19th.

**Belfast.**—A twelve months' supply of miscellaneous stores for the Electricity and Tramways Department. City Electrical Engineer, February 24th. (See advertisement on another page.)

**Bristol.**—Twelve months' supply of arc lamp carbons; joint, junction, and fuse boxes; A.C. wattmeters; D.C. mercury type ampere hour meters. Friday, February 14th. (See an advertisement on another page.)

**London: L.C.C.**—Tenders are to be invited from selected firms for metallic filament traction lamps.—The sum of £16,100 is to be spent on the reconstruction of tramway tracks recently acquired from the London United Tramways, Ltd., in Goldhawk Road and King Street, Hammersmith.

**South Africa.**—The Paarl Town Council have adopted an electric lighting scheme at an estimated cost of £34,465. Water power is to be used. The scheme has been drawn up by Mr. Thomas Stewart.

**Stirling.**—The Town Council are considering the installation of an electric tramway system.

## APPOINTMENTS AND PERSONAL NOTES

Mr. Lee Murray, who recently retired from the position of General Manager of Messrs. Bruce Peebles & Co., Ltd., engineers, Edinburgh, has started business on his own account at 10 Norfolk Street, Strand, London, W.C., as Engineering Representative (buying, inspecting, &c.), for firms and corporations in the Colonies and abroad.

The salary of Mr. W. H. Cooke, Borough Electrical Engineer, Luton, is to be increased from £500 to £600 per annum by two increments of £50 each.

The salary of Mr. W. C. P. Tapper, the Borough Electrical Engineer at Stepney, is to be increased by £100 per annum immediately, making his salary £850, with a further increase of £50 in 1914.

A mains and meter superintendent is required by the Taunton Electricity Committee at a salary of £2 per week.

Mr. F. Riley, of Rawtenstall, has been appointed Borough Electrical Engineer at Todmorden at a salary of £150 a year.

An electrical engineer is required capable of preparing lighting and power installation schemes. (See advertisement on another page.)

Instrument maker improver wanted by Foster Instrument Co. (See an advertisement on another page.)

## TENDERS RECEIVED AND ACCEPTED

**Preston.**—The tender of Messrs. Dick, Kerr has been accepted for the supply of 60 tons of rail at £7 17s. 9d. per ton.

**Southend.**—Subject to the sanction of the Local Government Board, an order has been placed with Messrs. Bellis & Morcom for a 500-kw. generating set (Crompton dynamo) at £2,900.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £74 15s. to £75 5s. (last week £74 10s. to £75).

**Osram Lamps.**—Owing to the rapid increase in sales, the General Electric Co. have found it necessary to double the counter room for dealing with Osram Lamps at 67 Queen Victoria Street. They have also acquired additional premises at their Osram stores in Union Street, where they are now able to hold twice as large a stock as heretofore.

**Advertising Service.**—We have received a circular from Marcus Heber Smith, 4 Racquet Court, Fleet Street, E.C., advertisement advisers and designers, describing a scheme for acting as advertising consultants, including copy-writing, preparing type lay-outs, proof reading, and engravers supervision at a fixed charge of five guineas per month. The firm do not act as advertisement agents in the ordinary way, but are in a position to place their experience at their clients' disposal.

**Dissolution of Partnership.**—J. A. Boshier and R. S. Belsten, trading as the Electrical Wiring & Accessories Co., Boot Buildings, Market Street, Aberdare, have dissolved partnership.

**Patents for Sale.**—The owners of patents for electrical controlling valves and regulating devices for direct-current dynamos are desirous of working them in this country. (See advertisement on another page.)

The proprietors of a patent for improvements in a steel-refining process desire to work it in this country.

**Credenda Conduits.**—This company last week issued a prospectus offering 30,000 £1 shares at par.

**Aluminium Cables.**—The British Aluminium Co. have sent us an extract of a report by Mr. E. D'Hoop, of the Brussels Tramways, presented before a recent congress. The author remarks that the following eight undertakings have aluminium cables in use: Copenhagen Municipal Tramways, Geneva Tramways Co., Lausanne Tramways, Lyons Tramways and Omnibus Co., Nuremberg Municipal Tramways, Nogentais (Paris) Co., the Paris General Omnibus Co., and the Société Nationale des chemins de fer Vicinaux, of Belgium. The proportion between the useful section of aluminium cables, in comparison with copper cables of the same conductivity, is about 1.65. The useful section of cables used for low tension frequently exceeds 1,000 sq. mm., the maximum mentioned reaching 1,700 sq. mm. The Siemens Schuckert firm have installed a cable, with a single aluminium conductor for single-phase current at 60,000 volts, on the Muldenstein-Bitterfeld section of the Prussian State Railways. The first application of these cables was at Rennes in 1901. All who have adopted these cables state that no practical drawbacks have been experienced. The making of the joints and connections, however, necessitates care. The ends should be cleaned carefully, and branch sleeves of large contact surface used, and the joint made as rapidly as possible, so as to limit the effects of the air. There is special advantage in using aluminium for cables of large section for continuous current. In some instances the economy thus secured exceeds 14 per cent. According to a formula worked out by the Copenhagen Tramways, the use of aluminium is advantageous when the price of aluminium in pounds per ton is lower by  $2.08 \times \text{price of copper} - 30$ . Independently of the question of price, aluminium cables have the advantage, in the case of very high tensions, when it is necessary to augment the section of the conductors in order to increase the dielectric rigidity.

## SUMMARY

CERTAIN proposals regarding symbols, rating and prime movers were made at recent meetings in Zurich of committees of the International Electrotechnical Commission, and await ratification of the forthcoming meeting in Berlin. (Page 71.)

AT a recent meeting of the Western Local Section of the Institution of Electrical Engineers, the discussion on transmission lines was concluded, and reference was made to the success of aluminium for the purpose. (Page 72.)

A FORM of illuminated advertisement is illustrated. (Page 72.)

A PUMP or blower combining the principle of the reciprocating pump with the high speed of the centrifugal pump is described. (Page 72.)

AN account is given in our monthly section on "Electrical Engineering in the Mining and Metal Industries" of the results of the electric iron-smelting installation at Trollhättan. (Page 73.)

A RECENT paper by Dr. R. Herzfeld describes some interesting features of the electric pumping plant now in use at the Dover Colliery. (Page 73.)

A PAPER by Mr. G. Blake Walker read recently in the Midlands points out the superiority of electric power over compressed air for coal cutting. (Page 74.)

THE Home Office electric rules for mines are being re-issued under the requirements of the new Act. (Page 74.)

AN agreement has been arrived at between the Sheffield Corporation and local wiring contractors. (Page 79.)

A NUMBER of Patent Specifications relating to miners' safety lamps, electric furnaces, magnetic ore separators and the electric driving of rolling mills were published by the Patent Office last month. (Page 75.)

THE starting of Latour-Winter-Eichberg single-phase commutator motors is dealt with in our "Questions and Answers" columns. (Page 77.)

A PAPER recently read in London describes two methods by which a ship can obtain her bearings by wireless. The House of Commons Committee inquiring into the Imperial wireless telegraph scheme has decided not to hear the evidence of Mr. Marconi until after Easter. (Page 79.)

WE give the details of the re-arrangement of the boards of several tube railways consequent upon the recent amalgamation. The South Eastern & Chatham Railway Co. are having a report upon the electrification of their lines prepared. The National Electric Construction Co. have secured the consent of the Hythe Council to their trolley-omnibus scheme between Folkestone, Sandgate, and Hythe. The shareholders of the Metropolitan Railway Co. are not inclined at present to sanction the purchase of the Great Northern & City Railway Co. (Page 79.)

A PATENT for duplex and quadruplex submarine telegraph working granted to S. G. Brown in 1900 and allowed to lapse has been restored. The grant of a Patent to the same inventor for submarine telegraph relays, although opposed, has been allowed. Among the Specifications published by the Patent Office on Thursday last is one for an electro-magnetic cut-in and cut-out by P. Wessel and T. Gysler, and one by the Siemens-Schuckertwerke, for a means of improving the commutation of rotary-converters, direct-coupled to A.C. boosters, through the medium of an auxiliary machine or by special windings on the booster, which is then provided with a double commutator. (Page 80.)

MR. DICKINSON proposes the addition of four 5,000-kw. or 6,000-kw. sets at Liverpool, and the gradual replacement of the existing Lancashire boilers by water-tube boilers.—The Woolwich Council are offering a supply in bulk to a number of neighbouring local authorities.—Street lighting extensions are recommended at Bedford.

New generating plant is required at Liverpool, Darlington, Barking, Derby, Chatham, and York; mains at Wednesbury, Wrexham, and Dover; converting plant at Marylebone; new cars at Leeds; and miscellaneous electrical stores at Battersea, Marylebone, St. Pancras, Manchester, and Leeds. A loan of £122,000 is to be taken up for a new power station at Bolton. (Page 81.)

### ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, FEBRUARY 6TH.

*Institution of Electrical Engineers.*

7 for 7.30 p.m. Annual dinner at Hotel Cecil.

FRIDAY, FEBRUARY 7TH.

*Association of Mining Electrical Engineers.*

8 p.m. London section. At Institution of Electrical Engineers. "Cables for the Shafts of Mines," by E. K. Scott.

MONDAY, FEBRUARY 10TH.

*Institution of Post Office Electrical Engineers.*

6 p.m. At Institution of Electrical Engineers. "Loading Coils," by S. A. Pollock.

*Institution of Electrical Engineers: Newcastle Section.*

7.30 p.m. At Armstrong College. "The Special Application of Electricity in Warships," by A. P. Pyne.

TUESDAY, FEBRUARY 11TH.

*Institution of Electrical Engineers: Manchester Section.*

7.30 p.m. At the University. "Advertising Electricity," by H. Clifford Palmer.

*Manchester Geological and Mining Society.*

4 p.m. At 5 John Dalton Street. "Colliery Cables," by W. T. Anderson.

*Institution of Electrical Engineers: Scottish Section.*

8 p.m. At Station Hotel, Edinburgh.

WEDNESDAY, FEBRUARY 12TH.

*Institution of Electrical Engineers: Yorkshire Section.*

7 p.m. At Leeds University.

*Batti-Wallahs.*

7.30 p.m. Informal meeting at Victoria Mansions Restaurant, Westminster.

*Association of Engineers-in-Charge.*

8 p.m. At St. Bride's Institute, Bride Lane, Fleet Street, E.C. "The Control of Alternating-Current Motors," by J. T. Mould.

THURSDAY, FEBRUARY 13TH.

*Institution of Electrical Engineers.*

8 p.m. "Notes on Parallel Operation," by A. R. Everest.

*Institution of Electrical Engineers: Dublin Section.*

8 p.m. At Royal College of Science.

*Junior Institution of Engineers.*

2.30 p.m. Visit to Osram Lamp Works, Hammersmith.

SATURDAY, FEBRUARY 15TH.

*Institution of Electrical Engineers: Scottish Section.*

Annual smoking concert at the Grosvenor, Glasgow.

*Birmingham and District Electric Club.*

6.30 p.m. Annual dinner at Swan Hotel, New Street.

*Old Centralians.*

6.45 for 7.30 p.m. Annual general meeting and dinner at Trocadero.

### The London Electrical Engineers.

(TO-DAY) THURSDAY, FEBRUARY 6TH. *C. Company.*—Company Training 7 to 10 p.m.

FRIDAY, FEBRUARY 7TH. *D. Company.*—Recruit Training, 7 to 10 p.m.; Company Training, 7 to 10 p.m.

SATURDAY, FEBRUARY 8TH. *C. Company.*—Week-end run at Fort Coalhouse. Parade at Fenchurch Street Station, 3 p.m. Service Dress. No arms. Headquarters open for Regimental business from 10 a.m. till 12 noon.

MONDAY, FEBRUARY 10TH. *A. Company.*—Recruit Training, 7 to 10 p.m.; Company Training, 7 to 10 p.m.

TUESDAY, FEBRUARY 11TH. *B. Company.*—Recruit Training, 7 to 10 p.m.; Company Training, 7 to 10 p.m.

THURSDAY, FEBRUARY 13TH. *C. Company.*—Company Training, 7 to 10 p.m.

FRIDAY, FEBRUARY 14TH. *D. Company.*—Recruit Training, 7 to 10 p.m.; Company Training, 7 to 10 p.m.

SATURDAY, FEBRUARY 15TH. Headquarters open for Regimental business from 10 a.m. till 12 noon.

**BINDING "ELECTRICAL ENGINEERING."**—Vol. VIII. of "Electrical Engineering" (Jan.—Dec. 1912) closed with our issue of December 26th, 1912. Readers can have their volumes bound by their own bookbinder; or, they may send their numbers to THE KILOWATT PUBLISHING CO., LTD., Temple Chambers, London, E.C., carriage paid (with the reader's name and address), and a remittance of 4s. 6d. under separate cover. The volumes will then be bound and returned carriage paid to any address in the United Kingdom, or carriage forward to the Colonies or abroad. Binding Cases (including index, but not including binding) 2s. each, or post free 2s. 4d. (Abroad 2s. 6d.) Index alone, 1d. (Post free 2d.)

### INTERNATIONAL ELECTROTECHNICAL COMMISSION

MEETINGS of three Special Committees on Symbols, Rating, and Prime Movers have recently been held in Zurich, and were presided over respectively by Prof. W. Wyssling, Mr. Huber-Stockar, and Dr. H. Zoelly. Certain proposals regarding symbols were adopted, but await ratification at Berlin in September next. Prof. Miles Walker's suggestions for adopting an entirely new method of dealing with the subject was given consideration; but the delegates decided unanimously that such a procedure was impossible.

Opinions were expressed in favour of the employment of "script" characters for vector quantities generally instead of for magnetic quantities, a proposal emanating from Germany. The Committee made certain modifications in their list of symbols so that, should the German view find favour ultimately and script letters not be recommended for magnetic quantities, no confusion would occur by two identical letters being proposed for the same quantity whether magnetic or electric.

In the question of the Rating of Electrical Machinery the British views were put forward by Dr. Gisbert Kapp and Dr. R. T. Glazebrook, the latter specially interesting himself in the method of employing temperature corrections for copper resistance. Mr. A. R. Everest officially represented the British Electrical and Allied Manufacturers' Association.

The International Standard for Copper was only briefly discussed, as Dr. Glazebrook and Prof. Paul Janet promised to consult with the other national laboratories on the subject, and transmit their final decision to the Berlin Meeting.

The Committee on Prime Movers has adopted the Report prepared by the Italian Committee on hydraulic-electrical installations. An important proposal was unanimously adopted "that the industrial unit of mechanical power be the kilowatt." It is hoped that the German Society will consent to withdraw the proposal to call the mechanical kilowatt the "Neupferd."

Detailed reports of the work of these Committees will be issued by the Central Office for the consideration of the various National Committees with a view to their ratification

at the next plenary meeting of the Commission, which will be held in Berlin from the 2nd to the 6th of September next.

The Italian Society of Electricians has decided to adopt the recommendations of the I.E.C. as and when promulgated, and to recommend their employment in all international specifications, and has decided to suggest that when the necessity arises, in international contracts, for an arbitrator, that he shall be chosen by the President, for the time being, of the I.E.C.

The general arrangements for Zurich meetings were attended to by the Swiss Committee and the Swiss Society of Electricians, whose President, Prof. Jean Landry, came from Lausanne to preside at the official banquet.

**Standardisation of Induction Motors.**—In a Paper read before the Students' Section of the Institution of Electrical Engineers on January 29th, by Mr. E. T. Driver, the results of an investigation into a method of designing lines of induction motors by taking a machine of normal design and varying the core length (and in direct proportion the output), while the diameters of stator and rotor are maintained constant, were given. The method was found to lead to a series of machines which possess good electrical properties and reasonable manufacturing costs. In actual practice more standard sizes of slots would be devised, and similar small items of design would receive more attention. In an estimation of the works cost of the effective material the cost of copper windings was taken as 2s. per kg., and the cost of stator and rotor iron as 7d. per kg. Although the works cost of non-effective material is subject to large variations, the author found from analyses of the works cost of many machines of similar type and output to those under investigation (normal 60 h.p. squirrel-cage motors for 25 and 50 cycles, altered for outputs as low as 20 h.p. and as high as 100 h.p.), that the total cost of non-effective material varied from £50 to £70 per 1,000 kgs. The mean value of £60 per 1,000 kgs., or about 1s. 2½d. per kg., was adopted. Curves were produced showing the relation between cost per h.p. and output. These curves had a marked tendency to become asymptotic with increase of output, showing that no further reduction of manufacturing cost could be procured by increasing the core length and output of the machines. The cost per h.p. increased with increase of poles, showing the desirability of high speeds.

## OVERHEAD TRANSMISSION LINES

THE discussion of this subject (see ELECTRICAL ENGINEERING, Vol. VIII., page 722, December 26th, 1912) by the Western Local Section at the Institution of Electrical Engineers was concluded on January 13th. Mr. A. Jacob (British Aluminium Company) spoke of the handicap imposed by the difficulty in obtaining wayleaves, which were against the realisation of Mr. Ferranti's ideals in the generation of power on the coalfields for transmission to the leading industrial centres. With regard to the economy of aluminium, it had been stated that the increased cost of towers or poles largely minimised the advantage of aluminium, but a close comparison of lines now under construction in Great Britain show a marked saving in favour of aluminium, though the regulations of the Board of Trade handicapped its adoption for sections under 0.1 sq. in. On long lines using seven to eight poles to the mile, such as are erected in Norway, Sweden, Canada, and the States, large economies are effected, and excellent reliability obtained. There was a general feeling in England against the use of aluminium on account of jointing, but a very satisfactory joint was the now well-known torsion joint. Where tappings had to be taken off, it was essential, he said, that mechanical couplings should be made of no metal other than aluminium. Corona losses were insignificant on voltages under 80,000 and for diameters of wire over  $\frac{1}{4}$  in. The larger the diameter the less important these losses become, and consequently this was another feature in favour of aluminium.

Mr. A. T. Kinsey (Post Office Telegraphs, Bristol) stated that he had not found the torsion joint satisfactory with 40-lb. bronze wire, but Mr. Jacob remarked that this was probably due to the fact that the wire was not stranded.

Mr. W. A. Chamen (Treforrest Electric Consumers, Ltd.) gave a few details of a fairly extensive three-phase, 400-volt system, in which he arranged his wires one above the other. He thought that a little extra height of pole was well compensated for by the simplification in crossing roads and in running branch lines. He used five wires, the lower one being the neutral, the next the switch wire for the public street lamps, and the three upper wires the phase wires.

## A NEW PUMP AND BLOWER

WE recently had the pleasure of inspecting the operation and details of construction of a new pump which is being put on the market by the Rotoplunge Pump Co., Ltd. (Albert Chambers, High Street, Cardiff), at their offices at 24 The Broadway, Westminster. The principle of the pump can be seen from the sectional diagram below. The casing A is divided into two portions by the shoes B. In the rotor C, which is keyed to the shaft, six or eight radial cylinders are bored. Pistons D work in these cylinders, deriving their reciprocating motion from the crosshead pin E, whose ends

DIAGRAM SHOWING PRINCIPLE OF ROTO-PLUNGE PUMP.

slide in the path F, which is set eccentrically to the axis of rotation, thus causing the pistons to move inwards the first half revolution of C (suction stroke), and outwards the second half revolution (delivery stroke), beginning at the top shoe. Thus it will be seen, it is a positive action valveless pump giving a continuous delivery, and with a high speed of rotation the piston speed is low. For high lifts the pump is made in stages with a common casing and all the rotors on one shaft. For a given output the pump is smaller than some on the market, and it is run at a high speed. It is claimed that no special foundations are required, and that it can create a vacuum to within half-an-inch of the barometer. It may be used for pumping any kind of fluid, and it appears from the condition of a pump, which we were told had been pumping continuously the dirty water from a large dock for two years, that slime and grit have very little effect on the working surfaces. The pump may also be used as a blower compressor or air pump, while by connecting the suction pipe to the exhaust from steam sets and providing for a water

spray at G in the diagram, a condenser is obtained. With regard to size and efficiency a 9 in. diameter pump, with 12 plungers 7 in. diameter by 3 in. stroke, running at 200 r.p.m., will discharge 60,000 gallons per hour on an overall head of 40 ft. The volumetric efficiency is about 95 per cent., and the mechanical efficiency over 70 per cent.

## ILLUMINATED HOARDINGS

FROM the point of view of equality of effect by day and night, some considerable advantage is to be obtained by the use of illuminated hoardings over signs lighted from behind. The British Thomson-Houston Co. (Mazda House, Upper Thames Street) have sent us the illustration reproduced here showing a very effective example of the former method. This is a painted board advertising Mazda lamps, recently erected at Victoria Station (L.B. & S.C. Rly.) by the British Thomson-Houston Co., Ltd. The board is 28 ft. long, about

ILLUMINATED ADVERTISEMENT AT VICTORIA STATION.

5 ft. deep, and is lighted by 40 Mazda lamps contained in a trough reflector attached to the upper edge, and projecting 10 in. therefrom. This arrangement provides effective and uniform illumination over the surface of the board. The reflector equipment is practically invisible. The company have also carried out a number of similar installations, using single light Mazda lamp reflectors, and are prepared to design and supply the equipment for lighting hoardings and painted signs of any size or description.

**Prosecution under the Factory Acts.**—At Leigh, on January 26th, the Hovebridge Spinning Co. pleaded guilty to a breach of the Home Office electrical regulations in respect of a faulty hand-lamp from which an employee received a shock. A fine of £5 and costs was imposed.

**Old Centralians.**—Old students of the college known successively as the Central Institution, Central Technical College, and the City and Guilds (Engineering) College, are reminded that the annual dinner is on Saturday, February 15th. If they have not yet sent in their names, they should apply at once to Mr. G. W. Tripp, 4 Fairfield Road, Charlton, S.E. The price of tickets is 6s. 6d.

**"Matchless" Economy.**—In an interesting communication, the British Thomson-Houston Co., Ltd. (Mazda House, Upper Thames Street, E.C.), have calculated that on the basis of 2d. a dozen boxes of 60 matches each, the light of an 8-c.p. Mazda lamp can be obtained (at 4d. per unit) for  $4\frac{1}{2}$  minutes for the same price as one match. Thus, reckoning that a dozen matches are saved per day by the adoption of electric light, in the course of a year the householder who uses Mazda lamps will have had 365 hours of light paid for by his match economies.

**Copper Production in U.S.A.**—According to the *Electrical World* (New York), the copper output in the United States in 1912 exceeded that of any previous year in the history of the industry. The smelter output, based upon returns for 11 months and estimates for the month of December, was 1,249,000,000 lbs. in 1912, against 1,097,232,749 lbs. in 1911. The average quoted price of electrolytic copper for 1912 was about 16 cents per lb., as compared with 12.5 cents per lb. for 1911. Figures published by the Copper Producers' Association show the production of refined copper amounted to about 1,570,000,000 lbs. in 1912, as against 1,433,875,026 lbs. in 1911. Stocks of refined copper held in the United States on January 1st, 1913, were 105,312,582 lbs., as compared with 89,785,000 lbs. on January 1st, 1912.

## ELECTRICAL ENGINEERING IN THE MINING AND METAL INDUSTRIES

### COMMERCIAL ELECTRIC IRON SMELTING AT TROLLHÄTTAN

THE electric smelting plant erected at Trollhättan, Sweden, in 1910 for the Jernkontorets Forsöksverk (The Swedish Iron Association's Experimental Works) was taken over by an old-established Swedish iron company, the Strömsnas Aktiebolag, Degerfors, in October last, and has been since then working commercially with great success.

The plant consists of one 2,000 kw. two-phase furnace, which is supplied through transformers from the 10,000-volt, 25 cycle three-phase distribution system of the large Government water-power station near by. The power is obtained at the rate of 34s. per electrical horse-power year. The transformers are connected two-phase on the secondary side, each phase being connected to one pair of electrodes. The pressure between the electrodes and the hearth is 45 volts, and a normal current of 12,000 amperes per phase is employed in the furnace. Arcing is avoided as much as possible, so that it is practically a resistance furnace, and has a power-factor of over 90 per cent. Except for being switched off for a few minutes two or three times a week to move the electrodes, the furnace works continuously. A charge of selected ores, charcoal, and limestone is put in every fifteen minutes, and every five or six hours the furnace is tapped, and some five tons of molten iron run out.

Assuming that the value of the iron produced is the same as that of ordinary Swedish charcoal blast-furnace iron, the economy of the electric furnace depends upon the relative prices of charcoal and current. In the ordinary blast furnace, three tons of pig iron produced require about three tons of charcoal, one ton for reduction and two for heating. The electric furnace gives three tons of iron for one electrical horse-power year with the one ton of fuel required for reduction, so that for equal cost of production the cost of the one electrical horse-power year should equal the cost of two tons of charcoal. The value of the latter is at present about 34s., or 17s. per ton, and consequently as electrical energy can be obtained from large water-power stations at a figure as low as 30s. per electrical horse-power year, electric smelting becomes cheaper providing the initial cost of the plant and the electrode consumption are not too high. As a result of tests carried out at Degerfors, it was found that the low-carbon iron, sometimes termed "pig-steel," produced in the electric furnace, was more suitable for use with the open-hearth process of steel manufacture than ordinary blast-furnace pig-iron, and under these conditions it is found that the electric smelting furnace can compete with the blast furnace with a higher rate for electrical energy than that given above, as the electrical product obtains a higher price.

The results obtained by the Jernkontorets Forsöksverk during the experimental periods ending March, 1912, have been published in two exhaustive reports (see *Metallurgical and Chemical Engineering*, Vol. IX., pp. 368, 459, and 505, and Vol. X., p. 413). The results obtained during a continuous run over a period of seven weeks just before the plant was taken over by the Degerfors Company last October were as follows:—The ore used contained 68.6 per cent. of iron, giving a percentage of 63.7 per cent. in the charge. During the period of 1,186 hours continuous working only 13.5 hours were taken up for moving the electrodes, slight repairs, and other interruptions. A total of 966 tons of iron was produced with a consumption of 1,940,000 kw. hrs., or just over 2,000 kw. hrs. per ton of iron. This corresponds to 3.2 tons of iron per electrical horse-power year. The average amount of charcoal consumed was 317 kg. per ton of iron produced, i.e., about one ton for three tons of iron, as stated above as that required for reduction. The average amount of slag was 192 kg. per ton of iron. The average load of the Trollhättan furnace, including the small amount of power required for the fans used to circulate the gases was 1,653 kw. The electrode consumption was only 4.5 kg. per ton of iron produced over this period. An attempt was made in the early part of 1912 to run the furnace with coke instead of charcoal, but this was not successful. This was due, however, only

to the shape and capacity of the furnace shaft, and comparatively good results have been obtained with a furnace especially constructed for using coke which is working at Odda, in Norway.

These furnaces, it may be mentioned, are constructed under the patents of Grönwall, Lindblad, and Stalhane, owned by the Swedish company, "Elektrometals." An English company has been formed under the name of Electrometals, Ltd., and this company owns the patent rights in Great Britain, the United States, Mexico, and all the British Colonies.

### ELECTRICAL PUMPING PLANT AT DOVER COLLIERY

A PAPER describing some interesting features of an electrical pumping installation which is at work at Dover Colliery to keep two shafts dry was read recently by Dr. R. Herzfeld before the Midland Institute of Mining, Civil, and Mechanical Engineers. The pumps are at the 1,275 ft. level, and are capable of dealing with 1,800 gallons per min. The generating plant available at the start was a pair of 250 kw. 3-phase alternators, and it was decided to make use of these sets to deal with the first 900 gallons, and later to double the capacity of the generating station. Two centrifugal pumps, each capable of raising 920 gallons per min. from a depth of 1,275 ft., were accordingly installed each with its own feeder. As far as pumping plant was concerned, there was thus a complete standby, although this was not so in the generating station. The pumps were therefore arranged so that when only one generating set was working, either of the pumps could still deliver 375 gallons per min. at a slightly reduced speed obtained by diminishing the frequency. To effect this with the best efficiency possible to avoid overloading the remaining set, the drive of each pump was subdivided into two motors of 300 h.p. each, one of which only would be taking the load in such circumstances; thus a motor efficiency of 93 per cent. is retained, instead of the 89 per cent., which is all that would be obtained by a 600 h.p. motor at half load; the difference in power factors is even greater. At the same time, the alternators were fitted with air vanes, which enable them to keep reasonably cool up to 300 kw.

A complete underground switchboard is provided. Each pump is controlled by one main automatic oil switch, and one extra switch for the stator of the second motor. Although both motors have been built exactly alike, with slip-rings on the rotor, one of them (as a rule the inner one) has these always short-circuited. The arrangement of building both motors exactly alike has been decided upon in order to secure an equal division of the load between the two. The outer motor has its slip-rings connected to an oil-immersed rotor-starter; and the triple-pole oil-switch fuse of No. 2 motor is interlocked with the rotor-starter in such a manner that it cannot be put in, unless the starter shows "full on" position.

The pumps are started up in the following manner:—The stator of No. 1 motor is excited. The starting rheostat then brings it up to speed, when the stator circuit of the second motor can be put in. Interlocking relays are provided in connection with the trip-gear on the oil-break automatic switch and the starting rheostat. In the event of the current being cut off on the surface, the main switch is tripped, and cannot be put in again unless the switch controlling the stator circuit of No. 2 motor is out, and the starting rheostat put to starting position.

The switchboard was arranged to accommodate a third feeder at a later date, and a special system of change-over switches is employed, guarding against the possibility of making a feeder live from below. When the first pump was put in, and there was danger of the shaft being flooded, it was considered inadvisable to have any switchgear below ground, so the pump was started by running one of the generating sets up to speed fully excited, the pump motor following in synchronism. Some trouble was experienced with the insulation of one of the cables at the start, and to

avoid straining the insulation, the system was run temporarily with one phase earthed.

Before the installation was completed, it was decided to increase the capacity of the generating plant so that both pumps could be worked together, and for this purpose a 600 kw. mixed pressure turbogenerator was put in, taking exhaust steam from the original sets and from a steam-driven air-compressor which formerly ran non-condensing.

### ELECTRICITY v. COMPRESSED AIR FOR COAL-CUTTING

IN the course of a Paper read on January 21st before the Midland Institute of Mining, Civil, and Mechanical Engineers, Mr. G. Blake Walker (Wharnccliffe Silkstone Collieries) made some interesting comparisons between electric and compressed air transmission for mining operations. Even with the most modern compressors, he said, it was not possible to transmit air with the same economy as electric current, and in practice the loss from leakage was greatly more in the former than in the latter system. The results obtained in return for the cost of producing compressed air were disappointing. With ordinary dry compressors fitted with jacket water-coolers, there was usually a loss of 25 per cent. by the time the air entered into the receiver, and the loss in the motors was quite as much. It happened frequently that the air actually converted into work underground was only 30 per cent. of the energy created by the steam-engine. This was where electric power showed itself more economical than compressed air, because the losses in the generator, in the conductor, and in the motor were all much less. Where, however, electric power was not permissible, compressed air, if somewhat more costly, became indispensable. Where the units were small and dispersed throughout a mine, it had been attempted to distribute these losses by installing small electrically-driven air-compressors as near as possible to the places where air-power was required. This was particularly the case with air for driving rock-drills. The system was less

cumbrous and more convenient, but he questioned whether the actual power-economy was much greater than with direct air-transmission. At Wharnccliffe Silkstone Colliery a modern two-stage compressor placed underground, driven by a 70-horse-power motor, was insufficient to drive two coal-cutting machines, which required about 25-horse-power each. It would just drive one coal-cutting machine and one face-conveyor, the latter requiring 8-horse-power.

### THE HOME OFFICE REGULATIONS

IN pursuance of the requirements of the new Coal Mines Act (1911) the Home Secretary proposes to establish general regulations under the Act. Copies of these draft regulations are now obtainable, and any objections to them must be sent in before March 1st, specifying the grounds of objection and the omissions, additions or modifications asked for. The rules affecting electricity in mines are contained in Part III., which embodies the existing special rules on the subject of the installation and use of electricity with such drafting alterations only as are required by their transference with General Regulations under the New Act. It is explained in an accompanying circular that if a "general objection" is made to any of the regulations either by or on behalf of owners of mines employing not less than one-third of the total number of men employed at the mines affected by the regulations, or by or on behalf of not less than one-third of the number of men so employed, or if any objection is made on behalf of the owners of mines of any particular class or in any separate area, and it is alleged that having regard to special conditions the proposed regulations ought not to apply to those mines, the Secretary of State will, unless he is of opinion that the objection is frivolous, refer it to a referee.

**The Association of Mining Electrical Engineers.**—At a meeting of the London Branch, to be held on Friday next, at the Institution of Electrical Engineers, a paper will be read by Mr. E. Kilburn Scott on "Cables for the Shafts of Mines." Mr. W. C. Mountain (President of the Association) will preside, and it is expected that a number of members of provincial branches (who will be in London for a Council Meeting) will be present. Among other points, the Paper will deal with aluminium for shaft cables, wire ropes for earth returns, and silicious tyre rubber for protection of sinking cables.

**Electricity in Mines.**—A Paper on Electricity in Mines, addressed particularly to colliery managers, was read by Mr. R. Nelson (H.M. Electrical Inspector of Mines), at a meeting of the North Staffordshire Institute of Mines and Mechanical Engineers at Stoke-on-Trent, on January 27th. Mr. Nelson dealt with the elementary part of the subject for those not versed in electrical matters, and gave some clear definitions and explanations, and dwelt particularly on the advisability of covering the insulation of cables with an earthed metallic outer covering, and the provision of sufficient surface of insulating material, with bare conductors to avoid creepage. He made quite clear under what conditions there was danger in touching a live conductor, and showed the importance of earthing all conducting material not normally intended to carry current. In conclusion a few notes were given on protective devices.

**Appeal in Regard to a Prosecution under the Special Rules.**—Judgment was given on January 17th by the Lord Chief Justice, Mr. Justice Coleridge, and Mr. Justice Rowlatt in an appeal against the decision of the Gateshead magistrates regarding the prosecution brought by Mr. J. B. Atkinson (Inspector of Mines) against Mr. H. M. Imrie (Manager of Chopwell Colliery). The case was reported in ELECTRICAL ENGINEERING in Mines, August 1st last, page xlv., and the appeal was referred to on page 5 of our issue of January 2nd. The alleged offence was neglecting to earth a switch-box as required by the Rules. A man had received a fatal shock from the switch-cover. The magistrates had refused to convict, and the appeal was brought by the Inspector. The case turned on the interpretation of the Rules, which are not enforceable as regards construction until 1920. The prosecution argued that earthing the switch was not construction, and did not come under this exemption; but the respondent held that the earthing, which would entail running a new cable to the surface, was "construction," and could not be enforced before 1920. The Lord Chief Justice held that the apparatus was clearly in use before June 1st, 1911, and came within the exemption clause. The other judges concurred, and the inspector's appeal was dismissed with costs.

ELECTRICAL MINING AND METALLURGICAL  
PATENTS OF JANUARY

## Metallurgical.

IN addition to those specifications already abstracted in our Patent Record, the following four relate to electric furnaces. No. 19,923/11, by N. Testrup and T. Rigby, deals with arc furnaces for the smelting of iron, which consist of two portions, the shaft and the crucible. A portion of the gases which have passed through the shaft are returned to the furnace, being taken from the shaft at such a point that no substantial amount of water vapour or other substance having a similar cooling effect on the furnace is present. The other portion of the gas is passed through the entering charge in the top of the shaft. In specification No. 2,081/12, by V. Stobie, a 3-phase arc melting or refining furnace is described. It is fed with current from a four-wire star connected supply. Three electrodes are arranged above the bath, each connected to a phase of the supply, while a fourth electrode, also above the bath, is connected to the neutral point to take any unbalanced currents. No. 16,040/12, by J. Bally, relates to induction furnaces comprising an inductor rotating inside the conduit constituting the armature. The inductor is formed of a number of polar pieces arranged radially round the axis, whilst the armature consists of inclined shafts connected together by horizontal conduits or solid connections on concentric cylinders. The shafts may be formed at their upper part with flaring recesses constituting working chambers. The shafts decrease in area from top to bottom, and are all connected at top and bottom by a circular channel. The shafts may be divided into groups, one group to a phase. The central space in which is the rotating inductor is surmounted by a chimney in two pieces. The fourth specification is No. 16,406/12, by the Soc. Générale des Nitrures. It deals with revolving furnaces, according to prior Patent No. 29,299/10, intended chiefly for the manufacture of aluminium nitride. The diametrical resistances are made in sections agglomerated together and having a bevel or feather edge.

Specification No. 29,230/11, by G. Ullrich, describes an improvement in the construction of magnetic ore separators covered by prior Patent No. 14,082/08. The improvement consists in a rotating member co-axial with and below the stationary armature rings and above the lower fixed magnets. The contour of this rotor is similar to that of the opposing face of the armature rings. It is recessed at intervals. No. 10,619/12, by the Elektromagnetische Ges., covers an improved magnetic separator for the wet separation of ores having a magnet system of an even number of poles rotating in front of a stationary induction ring to which the material is supplied from a channel rotating with the magnets.

To effect the manufacture of alloys of light metals with heavier metals, such as sodium with lead, by the electrolysis of fused salts, a process and apparatus is described in specification No. 1,001/12, by E. A. Ashcroft. A body of alloy at constant level in two cells with an intermediate reservoir to take up the variations in bulk is claimed. Continuous movement is imparted to the electrolyte, and a hollow anode for concentrating the gaseous anode product of the first cell and for driving off this product in a pure condition without completely closing the cell is also described, as well as the mechanical and thermal construction of the cell. Nos. 1,003/12, 1,004/12, and 1,005/12, by the same inventor, cover the use of a restricted exposed cathode area and other details

for the manufacture of alkali metals or of their reaction products.

The electrical driving of rolling mills is dealt with in two specifications. No. 1,365/12, by J. S. Peck and S. Eckmann, covers the method of obtaining variations in the speed of a D.C. compound fly-wheel motor by simultaneously varying the series and shunt field windings in the same sense. By this means the desired amount of energy can be given up by the flywheel, whether the motor speed is high or low, without exceeding the usual permissible speed drop of about 10 per cent. The motor need not be supplied from D.C. mains, but through rotaries connected to induction motors. No. 15,469/12, by Siemens-Schuckert, deals with gear for mill-driving where it is permissible to allow of certain fluctuations in the demand on the power mains, though the load is sudden and applied at irregular intervals. The size of flywheel is determined by considerations of the regular working processes separated by equal time intervals. During the longer intervals the power taken from the mains will slowly decrease to the no-load condition. One method of carrying the invention into effect is shown in Fig. 2. The magnetising coil *E* is energised in proportion to the current supplied to the motor from the mains, and inserts resistance in the rotor circuit as soon as the load at any time exceeds average value. A second magnetising coil, *F*, with a small time constant, is energised according to the frequency of the rotor current, i.e., the slip, and consequently in the inverse proportion to the energy remaining in the flywheel. The coil *F* opposes the coil *E*, so that more energy is supplied to the motor while the flywheel is giving out energy, and less while it is storing up energy. Certain modifications may be made in the position of the spring *G*, when the coil *F* may be omitted. If a D.C. motor is used instead of a 3-phase, the coil *F* may be placed in the exciting circuit. If a battery, *B*, is used instead of a flywheel, the same result can be obtained if the coil *F* is connected across the battery. The dotted lines in the diagram show the arrangement in this case. *D* is an auxiliary machine.

## Mining.

The following patent specifications of interest to mining electrical engineers have been published during the month of

FIG. 1.—SAFETY LAMP WORKING UNDER AIR PRESSURE.

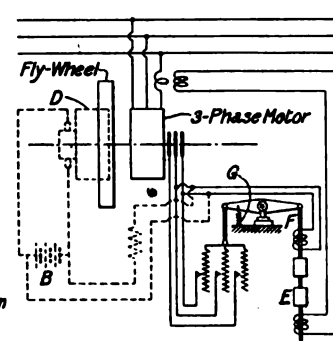

FIG. 2.—ROLLING MILL MOTOR CONTROL.

January. No. 28,388/11, taken out by J. H. Hoadley and W. H. Knight, covers their hydro-electric system of coal

mining described in *ELECTRICAL ENGINEERING*, Vol. VIII., Oct. 3rd, 1912, p. LXIII. No. 29,334/11, by G. A. Dickie, gives constructional details of a miner's electric safety lamp. The lamp and switch are enclosed in a glazed and hermetically sealed chamber provided with an elastic diaphragm, so connected to the switch that the latter can only be closed when the air pressure in the chamber is greater than atmospheric. Provision is made for the use of a cycle pump for

FIG. 3.

FIG. 4.

UNSPILLABLE SAFETY LAMP.

this purpose. Diminution of this pressure to atmospheric due to any cause opens the switch. An outline of the proposed lamp is given in Fig. 1. Specification No. 78/12, by T. Sparkes, has for its objects to provide a safety lamp with unspillable battery. The insertion of a charging plug provides

for the escape of gases evolved during charging. The lamp bulb is preferably placed over a conical reflector enclosed in a glass dome mounted on the battery box cover. The lamp-holder, reflector, and dome are assembled in position from the inside of the containing box, and are held by a screwed plug. The construction proposed in the specification is shown in Figs. 3 and 4. Any ordinary form of locking may be used. For charging a charging plug is used. It has two pegs of different sizes, which fit into slots in the brass angle pieces. The plug then presses against the end of the spindle valve, and allows the evolved gases to escape through holes in the valve guide.

**The Safety of Electricity in Mines.**—A Paper entitled "An Account of Experiments on Safety Devices in connection with Electrical Machinery for Coal Mines" was read by Professor D. Bowen (Mining Department, Sheffield University) on Saturday last before a joint meeting of the Yorkshire branches of the National Association of Colliery Managers and the Association of Mining Electrical Engineers. The author said that his chief object in presenting the Paper was to point to the necessity for continued research into the best form of protection to use. Many of the experiments of German and American investigators were, he said, inconclusive, and were carried out without any real knowledge of mining conditions. The future of the economic working of coal mines was, in his opinion, unquestionably bound up in the application of electric power and machinery in mines. His experiments demonstrated that plate protection was so far the safest method, and that the pressure was increased where fans were inserted in the motor-casings, as a result of the agitation of the explosive atmosphere inside. In the course of the discussion, Mr. Halliday (Featherstone) expressed the opinion that there might be a danger of dust and coal particles being drawn between the plates during the "breathing" of a motor, and that these particles might be blown out in an incandescent state in the event of an explosion in the motor chamber, and might ignite any explosive mixture in the outer atmosphere, although no flames issued. Professor Bowen, however, did not think that there was any danger on this score on account of moisture which would accumulate.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelopes.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,325.

In cases where electric trains with collectors at both ends run through from the lines of one company to those of another fed from an entirely independent power-house, by what means are excessive interchanges of current avoided at the moments when the train puts the two systems in parallel, if the voltage on one line happens to be much in excess of that of the other?—R.

(Replies must be received not later than first post, Feb. 13th.)

### ANSWERS TO No. 1,323.

Describe the best starting arrangement for the Latour-Winter-Eichberg single-phase commutator motor, using an autotransformer, so as to obtain the best distribution of current in the rotor and stator to give the maximum starting torque with the minimum K.V.A. taken from the mains. How does the design of the motor affect the adjustments of the apparatus?

The first award (10s.) is made to "B. S. L.," whose reply in slightly condensed form is as follows:—

Assuming a motor for at least 250 volts, the rotor is not directly in series with the stator. The current supplied to the rotor is less than that in the stator, as part is diverted by a transformer. This is the usual practice, so that there shall be no excessive sparking nor danger of a flash over on the commutator. Fig. 1 shows the scheme of connections to the different parts of the controller in a certain case. Two autotransformers are used: one, the exciting transformer, is used to divert part of the stator current in order that the rotor current may be less, and it also performs the function of supplying a still lower voltage to the rotor at starting for purposes which are explained later. The other transformer is placed

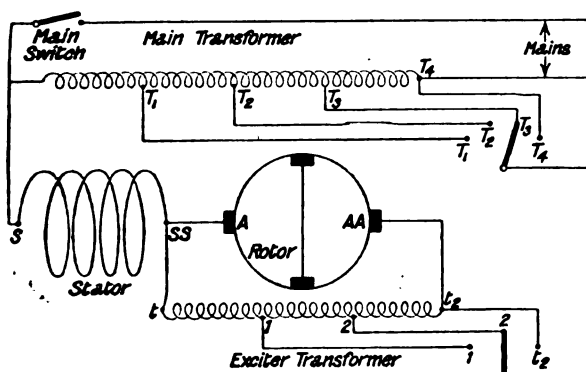

FIG. 1.

across the mains, and tappings are taken to the various points on the controller,  $T_1$ ,  $T_2$ ,  $T_3$ ,  $T_4$ , giving a four-step controller.  $A$ ,  $AA$  are the main brushes, and  $S$ ,  $SS$  the stator terminals;  $t_1$ ,  $t_2$  is the exciting transformer, and 1, 2 are tappings from it. At the first stop on the controller the main switch is closed, and the machine is placed across the first tapping of the starting transformer; at the same time a small proportion of the

stator current passes through the rotor. On the next two stops the voltage across the machine is increased, while the rotor current still bears the same proportion to the stator current. On the fourth stop, however, the full voltage and full exciting current are put on, although it must be borne in mind that the full rotor current is not equal to the stator current. Now the full current is going through the stator, and the rotor is excited by the required proportion of the stator current. If it were desired to make the machine a full series one, and have the same current in rotor and stator, it would only be necessary to remove the connection from 2 to  $t_1$ . Now at starting, owing to the short-circuited brushes on the rotor, the stator acts like the primary of a transformer of which the secondary is short-circuited. Hence it acts like a non-inductive resistance, and almost the full applied voltage (differing only by CR stator drop and leakage considerations) is across the main brushes of the rotor. Thus a great advantage is gained by reducing the voltage across the rotor, for it means an increase in the power-factor of the current taken at starting, as the rotor current is increased gradually instead of the necessary proportion of the stator current being taken at once. Another result is that if the starting torque is considered constant, then the total K.V.A. taken from the mains is higher because of the current diverted by the transformer. [This depends on the relative impedances of stator and rotor, and is a question of design.—Ed. E.E.] The starting transformer is, of course, essential, as it would not be possible to place the machine at once across its rated voltage, as there is no back E.M.F., and the current taken would be excessive; this is quite a similar case to that of the ordinary D.C. motor; and it is more advantageous to have a transformer than a resistance, because no power is lost in the transformer, and an auto-transformer is used, as it is more simple. If the motor runs on a low voltage supply, then an exciting transformer is unnecessary.

The second award goes to "Roy," whose reply in abbreviated form is given below:—

The Latour-Winter-Eichberg motor has the usual induction-type stator and an armature wound with an ordinary continuous-current winding having a commutator with a large number of segments. On this commutator are fixed two pairs of brushes, one pair being short-circuited and fixed at 90 electrical degrees from the other pair; the latter are connected so as to put both armature and stator windings in series. For purposes of speed regulation the armature receives current from the secondary of a transformer with adjustable tappings, whose primary is in series with the stator winding. This transformer can be coupled to an auto-transformer, also with adjustable tappings, as shown in Fig. 2. A still wider economical speed

FIG. 2.

range is thereby obtained with no waste of energy. Reversal of direction of rotation is obtained by reversing the direction of the current in the armature or field windings. The currents in the stator and in the rotor windings between the brushes  $CD$  are in phase with one another, since they are both supplied from the same source in series. The motor thus starts up very much like a series motor, except that the flux of the stator winding is largely neutralised by the currents flowing in the short-circuited armature through the brushes  $AB$ . The impedance of the motor at starting is thus due chiefly to the circuit  $CD$ , which forms an inductive circuit, since the vertical flux due to the armature current is not neutralised. As the motor speeds up the conductors cut this vertical flux, and thereby a voltage is induced between  $AB$ , making the stator less like a short-circuited transformer. The voltage across the stator winding thus increases, and resembles that in the primary of a transformer working on a non-inductive load. This has the effect of increasing the horizontal flux crossing the air-gap. This horizontal flux is also cut by the conductors in rotating, so that a back voltage is also induced between the brushes  $DC$ , and this has the effect of raising the power factor. Rotation thus changes the distribution of voltage between the

stator windings and the series transformer, and the speed adjusts itself until both portions of the circuit are practically non-inductive. By altering the secondary turns of the series transformer, it can be arranged that the motor can be made to exert full torque and to work at its maximum power factor at several different speeds. All alterations of speed are effected by oil-immersed controllers varying in construction, according to the size and type of motor and the pressure used in the first instance.

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**SHADE GALLERIES.**—A card from the General Electric Co., Ltd. (67 Queen Victoria Street), describes the "Autogrip" gallery which dispenses entirely with screws, and allows the adjustment of a shade in a moment's time merely by the pressure of finger and thumb on a wire spring. The shade is held in position by three teeth-like clutches, which are adjusted to grip firmly, but without unnecessary pressure. The contraction of the spring throws the three clutches back, permitting the shade to pass them. When the spring is released, the clutches return to position and grip the shade.

**ARC LAMP CLEANING.**—Another novelty, of which the General Electric Co. give notice on a card, is the "Kleenark," which is a simple device for removing deposits in flame arc lamps, without allowing the dust to escape. It consists of a transparent, incombustible rim, to which is fixed an upper and a lower bag. The upper bag is open to receive the base of the lamp to which it can be secured tightly by means of a tape. The lower bag is fixed to the rim. A loose brush is used inside, and as the rim is transparent, the trimmer can see what he is doing.

**ELECTRIC HEATING AND COOKING APPARATUS.**—A small folding price-list of "Meta" heating and cooking appliances is to hand from the Metallic Seamless Tube Co., Ltd. (Meta House, 153 Corporation Street, Birmingham). The company will be glad to furnish our readers with quantities of these lists overprinted with their names and addresses free of charge on application. The apparatus dealt with includes some handsome designs of glowing and other heaters, toasters, warming plates, kettles, shaving pots, milk warmers, irons, and frying pans.

**CONTROLLER SPARE PARTS.**—A small folder from the British Westinghouse Electric and Manufacturing Co., Ltd. (Trafford Park, Manchester), gives particulars of their complete scheme of interchangeable controller spare parts.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**ELECTRIC CARPETS.**—A list from the Schniewindt Electric Co. (40 and 41 Stainforth Street, Birmingham) describes the Stangertherm system of electric carpet-heating. The heating element is entirely separate from the carpet itself, and is enclosed in a watertight insulating envelope, which is placed between the carpet proper and a waterproof underlay fitted to the carpet, and open at one end to receive the element. The heater can be applied to any part of the carpet, and can be easily withdrawn when not required.

**TELEPHONES.**—A new list from the Sterling Telephone and Electric Co. (200 Upper Thames Street, E.C.) deals with domestic, battery, magneto and intercommunication telephones of various patterns, as well as bells, indicators, and accessories. The cream and gold finished "Twencen" domestic telephone has been reintroduced.

**MINE EXPLODERS.**—Another Sterling list deals with the company's latest pattern of "Permitted" shot-firing generator for miners, which is fully in accordance with the revised requirements of the Home Office.

**DRIVING BELTS.**—A neat booklet is to hand from the Bell Rock Belting Co. (Norton Works, Gravel Lane, Salford), in which is given some particulars of the new "Zenith" belting. It has a textile basis, but is subjected to various preservative processes.

**"COMSTICK."**—A leaflet from S. W. Cuttriss (Park Row, Leeds) calls attention to a solid commutator dressing compound known by the above name, conveniently made up in sticks.

**SUPPLY ADVERTISING.**—We have received a copy of a revised and enlarged edition of the excellent electricity consumers' guide issued by the Grimsby Corporation Electricity Department.

**ELECTRIC DRIVING OF PRINTING MACHINERY.**—The Adams Manufacturing Co. (Balfour House, Finsbury Pavement, E.C.) have issued a second edition of their booklet on "Electric Control of Printing Machinery," which deals very thoroughly with control gear for electrically-driven printing machinery of

every description, and contains a mass of valuable information which should be in the hands of all interested in this subject.

**ELECTRIC COOKING APPARATUS.**—A series of leaflets from the Westminster Tool and Electric Co. (Suffolk House, Laurence Pountney Hill, E.C.) call attention to some of their electric cooking specialties, including a convenient grill suitable for cooking breakfasts for two or three persons, which can be used also for toasting and boiling. A larger cooker comprises a self-contained oven, combined with a grill and a boiling plate, capable of doing all the cooking for two or three persons. A complete range for eight persons, with large oven, three boiling plates, and a grill, all with three degrees of heat, is also listed.

### THE SHEFFIELD WIRING DEPARTMENT

THE Sheffield Corporation have, as a result of a conference with the local electrical contractors, come to an arrangement which will remove all opposition to their Bill now before Parliament, and will, it is hoped, tend to amicable working between the Corporation and contractors in Sheffield in future. The result of the Conference in question has led to the insertion of the following sub-section to the clauses in the Bill which at present, as modified by the House of Commons, give the Corporation full wiring powers. The sub-section reads as follows: "The Corporation may enter into contracts for the execution of any of the powers of this section, including the wiring of private property. The Corporation shall not, under the powers of this section, sell any such electrical fittings (other than electric lines, fuses, switches, ceiling roses, and such other electrical fittings as are used in connection with the wiring of private property from the distribution mains as far as ceiling, wall, or floor outlet only), except through a contractor carrying on his business independently of the Corporation." This means, of course, that the Corporation may wire as far as the ceiling roses and floor outlets, but that the contractor is to be left to supply, fix, and wire to the fittings and switches in the various rooms.

An announcement to the above effect was made on Tuesday, when the Sheffield Bill came up in the House of Lords for consideration of the House of Commons' reasons for disagreeing with the action of the House of Lords earlier in the session, when clauses to the effect that the Sheffield Corporation could only carry out wiring work through a contractor were inserted. The effect of the above agreement, however, was to obviate any necessity for discussion by the House of Lords, although the Earl of Donoughmore wished it to be distinctly understood that the House of Lords does not depart from the attitude they have taken up in recent years on this matter, viz., that municipalities should not be allowed to do wiring work.

The amendment, which is a compromise between the Corporation and the contractors, will now have to come before the House of Commons for their approval, but as it is agreed between the parties there is not likely to be any opposition.

### F. H. LOVELL & COMPANY, of ARLINGTON, NEW JERSEY, U.S.A.

#### DESIRE TO ANNOUNCE

That they maintain a large and well-equipped Brass Foundry, Machine-shop, and Finishing Rooms suitable for the manufacture or assembly of electrical and steam specialties. They are in close touch at all times with the U.S. Navy Department and the leading companies, whose patronage they have enjoyed for many years. They are therefore peculiarly fitted to handle under the new provisions of the new U.S. Act governing the free importation of material used in shipbuilding, such raw materials and such devices as can be imported in part and assembled here.

They solicit the inquiries of all those who are desirous of obtaining capable U.S. Agents for the handling of their products.

BEDFORD  
AND  
LONDON

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

A paper on "Directive Wireless Telegraphy," by Mr. F. Addey, was read recently before the London Centre of the Institution of Post Office Electrical Engineers. The early part of the paper deals with directive wireless from an historical standpoint as revealed by published researches and patent specifications. The Bellini-Tosi apparatus is next described. This has been most fully dealt with in *ELECTRICAL ENGINEERING* for Nov. 14th, 1907, Vol. II., p. 771; March 5th and April 2nd, Vol. III., pp. 848 and 507; July 14th, 1910, Vol. VI., p. 457; March 11th, 1909, Vol. V., p. 233; July 14th, 1910, Vol. VI., pp. 457 and 491.

There are two methods by which a ship can obtain her bearings by wireless. In the first, the shore station has a number of radiating aeriels from which signals are successively emitted, and the ship is provided with means by which the signals from each of the aeriels, the directions of which are known, can be distinguished, and the strength of each noted. In the second method a directive receiving apparatus is fitted on the ship, the shore station being non-directive. The first system has been developed by the Telefunken Co. Sixteen double directive aeriels are erected in the form of a symmetrical star. The inner end of each half aerial is led to one of 34 contacts, arranged in a circle. The leads from the two parts of one complete directive aerial are led to contacts at opposite ends of a diameter. The contacts immediately before the north and south contacts remain free; these are joined together and led to a non-directive aerial. A rotating switch which bridges a diameter of the circle, and is connected to the transmitter, causes signals to be emitted first on the non-directive and then successively on the directive aeriels. It makes one revolution each half-minute. By means of a stop watch the direction of the station can be determined, for each aerial radiates least in its own plane. By a modification of the Bellini-Tosi system the Marconi wireless compass has been developed. The opposite halves of each directive aerial are joined together at the top, the upper parts being insulated. The bases of the triangular aeriels are cut in the centre, and insulators inserted. The leads to the coils of the oscillation transformer are taken from each side of the cut aerial bases close to the insulators. Each aerial coil is divided in the centre, and a variable condenser inserted. These condensers are arranged so that their capacity can be simultaneously varied by the motion of a single handle. With this arrangement of the aerial system, it is found to be no longer necessary to make the dimensions of the antenna comparable with the length of wave to be received, a condition which evidently could not be met on board ship for the wave lengths used in practical wireless working.

The ordinary aerial and wireless installation are not altered in any way when the compass is fitted, but protecting switches are inserted in the aerial leads. Protective spark gaps are also inserted across the leads to each aerial. A pointer which moves over a graduated scale is attached to the axle of an exploring coil, which turns between coils in the aerial circuits.

An arrangement, by which the connection of the detector to the aeriels is made through an intermediate tuning circuit, and in which the detector circuit is also tuned, is intended for use by skilled operators. Where non-skilled operators only are available the exploring coil is joined, through two blocking condensers, directly to the detector. The aerial circuits alone are tuned, the detector circuit is aperiodic. Bearings can be taken to within two degrees. In practice, the apparatus is fixed so that the zero diameter of the circular scale is parallel to the ship's axis, and hence the position of the pointer gives at once the direction of the sending station. Automatic transmitting gear must be employed at the shore stations, of which there must be a large number, and they must be in continuous operation.

The Eastern and Eastern Extension Telegraph Companies are contemplating laying a new telegraph cable from Suez to Hong Kong, and have applied for the necessary landing rights. The route will be via Colombo, and a different route will be adopted to those of the cables to Bombay and Madras, so that the new cable may not be liable to simultaneous troubles due to subsidences, &c. Until the landing rights have been obtained, it is premature to publish any details of

the proposed cable, but we may state that in view of the enormous mechanical pressures to which ocean cables are necessarily subjected, there will be no suggestion of possible experiments with loading coils.

It has been decided that Mr. Marconi's evidence with regard to the Imperial wireless telegraph scheme will not be taken by the House of Commons Committee until after Easter. The whole time of the Committee since our last issue has been occupied in the cross-examination of Mr. W. R. Lawson, the financial journalist, who originally started the rumours that Cabinet Ministers had profited by their advance knowledge in regard to the agreement, and dealt in Marconi shares.

In our last issue, page 65, line 19, for "Sir Alexander Kennedy and the Secretary to the Post Office," read "Sir Alexander King, Secretary to the Post Office."

## ELECTRIC TRACTION NOTES

The half-yearly meetings of the Metropolitan Railway Company and Great Northern & City Railway Company were held on Wednesday last week, and in both cases the question of amalgamation was discussed at some length. However, whilst the shareholders of the Great Northern & City Co. passed the necessary resolution authorising the sale of their undertaking to the Metropolitan Co., the shareholders of the latter at present fail to see any great advantage in the proposed acquisition, and it was agreed to adjourn the meeting for a fortnight in order to allow a number of the larger shareholders of the Metropolitan Co. to confer with the Board on the matter.

After receiving a report as to the satisfactory working of trolley omnibuses at Leeds, Rotherham, and Bradford, the Hythe General Purposes Committee recommend that the trolley omnibus scheme of the National Electric Construction Co. shall be consented to. It is proposed, however, that one of the conditions of this consent shall be a contribution, not exceeding £1,000, for street improvements.

The South Eastern & Chatham Railway Co., naturally enough in view of the L.B. & S.C.R. results, has the question of electric traction under their careful consideration. In fact, the matter has gone so far as to have been in the hands of a leading consulting engineer for some time, and as soon as his report is received it is possible that some public announcement will be made.

Now that the amalgamation of the Central London Railway Co. and the City & South London Railway Co. with the London Electric Railway Companies has been formally approved by the respective shareholders, there will be, as might have been expected, considerable changes upon the boards of directors of the first named. Lord George Hamilton, Colonel Sir Herbert Jekyll, and Mr. A. H. Stanley join the Board of the Central London, the latter as Managing Director. Mr. H. F. Parshall retires from the Board, but continues as Consulting Engineer. Mr. Stanley will also be Managing Director of the City & South London, and another addition to the Board of this Company will be Mr. T. C. Jenkin, who has resigned his position as the General Manager of the Company. Lord George Hamilton has resigned from the Chairmanship of the London Electric Railway Co., and is succeeded by Lord Farrer.

An amusing summons was heard at the Bradford City Police Court last week. There is an inter-communication arrangement between the Leeds and Bradford tramway systems, and it appears that a man travelling in a Leeds car on the Bradford lines was summoned for a breach of the Bradford bye-laws, in using obscene language upon the car. The point was raised as to whether in the circumstances the Bradford police had any jurisdiction, as the offence took place on a Leeds tramcar, but eventually the magistrates decided to convict, and imposed a fine of 2s. 6d. and 13s. costs.

## "ELECTRICAL ENGINEERING" PATENT RECORD

*(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)*

### Specifications Published Jan. 30, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

**Names in italics indicate communicators of inventions from abroad.**

**412, 12. Telegraphing over Power Mains.** *SOC. INDUSTRIELLE DES TÉLÉPHONES.* Wherever a receiving station is required, a neutral point is formed between the conductors. Signals are sent from any place by earthing one of the lines through a resistance or inductance, since this sets up a P.D. to earth at each of the neutral points, which may be utilised to work a receiver. Two figures.

**6,061/12. Pulp Coils.** *F. A. BECKER.* The laminated core is divided, or its reluctance is regulated so that the magnetic flux is practically uniform. The core may consist of geometrically similar tubular cross-sections forced into one another, or bands of magnetic material may be spirally wound on one another. Four figures.

**8,260, 12. Igniters for Gas Burners.** *J. KEITH and G. KEITH.* A platinum filament is protected by a metallic cover having a small adjustable louvred piece. This louvred piece catches some of the main jet and diverts it inside the cover, where it is ignited by the filament. A large jet may thus be ignited with no risk of cooling the filament by the rush of gas. Two figures.

**9,492/12. Ignition Electrodes for Internal-combustion Engines.** *H. BAUER and M. ECKMEIER.* An air-driven rotary metal disc in the ignition chamber has both electrodes pointing towards it. The end of one scarcely touches the rim of the disc, while the end of the other is further removed. It is found that the spark, which is long, goes direct from one electrode set to the other, and in the direction of rotation of the disc, and there is no sooting. The disc may be made with pockets to ensure intimate mixing of the gases. Six figures.

**14,120 12. Overload Cut-outs to Automatically Cut-in Again.** *P. WESSEL and T. GYSLER.* A working relay is switched in on overload by the main circuit relay, which has a thin armature. The armature of the working magnet effects a periodical interruption of the main circuit through a contact arm provided with an air-brake. There is also an auxiliary paralleled contact in a slot in the iron core of the working magnet, the working of which is always effected after that of the main contact, and at a greater speed. A contact spring in the working magnet circuit maintains this circuit until the air-brake, after the demagnetising of the relay magnet, has moved a certain distance. Another contact spring, on the armature of the working magnet, is attracted, closing a circuit of the working magnet through its arm. Five figures.

**14,755 12. High-frequency Undamped Oscillations.** *V. F. FEENEY (Nat. Wireless Teleph. & Telegr. Co., U.S.A.).* Movable series electrodes are controlled by a solenoid through clutches which engage with them through springs compressed by the solenoid. The electrodes are liquid cooled, and alternate poles are metal and carbon. The carbon electrodes are perforated to allow of the free flow of the cooling liquid in the direction of the axis. Seven figures.

**14,835 12. Sterilisation of Milk.** *A. HEBRONNER, M. VON RECKLINGHAUSEN, and V. HENRI.* The milk is first raised to a temperature of 50° C. to 70° C. for a short time, and then subjected to the action of ultra-violet light.

**16,045 12. Transformer Boilers.** *J. BALLY.* The liquid is heated by the hysteresis and eddy currents induced in a magnetic container mounted in refractory material. The magnetic frame extends through a series of tubes in the form of hollow coils, which communicate at the top with a steam collector and at the bottom with a mud drum. A number of circular tube systems, constituting the secondaries of as many transformers, may be arranged one above the other or side by side in the same body. The magnetic core may also be formed of superposed hollow pieces or bundles of parallel tubes to form a feed-water heater. Three figures.

**19,890 12. Locomotives, Boats, &c.** *OERLIKON.* The driving motors have squirrel-cage rotors, and are fed by a polyphase alternator coupled to a prime mover on the vehicle. The speed of the rotors is governed by adjusting the speed of the prime mover while starting; stopping and reversing is effected by ordinary control gear.

**25,755 12. Sparkless Commutation of a Rotary Mechanically Coupled to an A.C. Booster.** *SIEMENS-SCHUCKERT.* The compensating windings are energised by a current varying with the load on the booster, as well as by the D.C. current from the converter. This extra exciting current may be derived from extra brushes on an auxiliary commutator on the booster, and lying in the direction of the main poles; auxiliary poles mid-way between the main poles are energised by the direct current from the converter. Auxiliary windings on the booster armature may be used, or else an auxiliary dynamo with con-

stant field driven by a D.C. motor whose armature is connected to the field coils of the booster. These two machines may be combined into one, having two commutators, and operating in conjunction with fields of different numbers of poles. Five figures.

### Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

**Summaries of some of the more important of these patents will appear in our next issue.**

**Arc Lamps:** PAULING [Electrodes for endothermic gas reactions] 24,051/12.

**Distributing Systems, &c.:** B. T.-H. and GARTON [With variable-speed generators] 1,681/12.

**Dynamos and Motors:** ROSENBERG [A.C. motor control] 1,979/12.

**Electrometallurgy and Electrochemistry:** ASHCROFT [Treating alloys of alkaline metals to obtain various products] 1,002/12; B.T.-H. (*A.E.G.*) [Welding] 2,343/12; ROUND and FISHER [Electroplating] 15,492/12; BOCUZE [Furnaces] 21,290/12; *GES. FÜR ELEKTRO-OSMOSE* [Extraction of water from animals, vegetables, or minerals] 23,545/12; COLLETT and NORSK KVAELSTOFAKTIESELSKAB [Ammonium phosphate and nitrate] 26,097/12.

**Heating:** BALLY [Boilers] 16,042/12.

**Ignition:** DIEHL [Rotating interrupters] 2,472/12.

**Incandescent Lamps:** BOSSON and GUESNIER [Vapour] 991/12; WILSON and CANDOLITE Co. [Candle lamps] 1,178/12; BALLY and PLEWS [Renewable] 3,906/12; LUSTED, 9,983/12; B.T.-H. (*G.E. Co., U.S.A.*) [Machines for forming filaments] 11,252/12.

**Instruments and Meters:** CLARK and MAY [Galvanometers] 9,094/12.

**Storage Batteries:** NIBLETT, 819/12.

**Switchgear, Fuses, and Fittings:** MÜLLER [Holders for lamps] 1,166/12; VICKERS, LTD. and CREFFIELD [Remote motor control] 1,280/12; PRICE [Switches] 5,562/12; PALMER [Lamp-shade holders] 18,177/12; LUNDBERG [Switches] 21,915/12; DE THIERRY [Automatic control for cut-outs] 22,251/12.

**Telephony and Telegraphy:** WILLIAMS [Enumeration of telephone calls] 28,171/11; REHDER and VOIGTSBERGER [Transmitting telegraphic code figures into words] 9,195/12; PEAKE [Wireless] 10,501/12.

**Traction:** SIEMENS BRÖS. (*Siemens & Halske*) [Block signalling] 5,559/12; [Signals for supervising relative positions of turn-tables, &c.] 14,658/12.

**Miscellaneous:** HUNTE and HUNTE [Battery lamps] 1,015/12; STERLING TELEPHONES (*Schaffner & Co.*) [Mine exploders] 5,712/12; KEITH and KEITH [Valve control] 6,517/12; BECKER [Pocket lamp] 19,246/12.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Distributing Systems, &c.:** BECKER [Abnormal pressure rise control] 12,908/12.

**Dynamos, Motors and Transformers:** CONRAD [Vapour rectifiers] 622/13.

**Electrochemistry:** *GES. FÜR ELEKTRO-OSMOSE* [Metal adsorptions] 29,049/12.

### Grant of Patent Allowed

20,451/11. **Telegraphic Relays.** *S. G. BROWN.* The Controller has allowed the grant of the Patent [ELECTRICAL ENGINEERING, Vol. VIII., Oct. 3rd, 1912, p. 550, and Oct. 10th, 1912, p. 564] subject to amendment.

### Lapsed Patent Restored

7,471/00. **Submarine Telegraphy.** *S. G. BROWN* [ELECTRICAL ENGINEERING, Vol. VIII., Oct. 24th, 1912, p. 588].

### Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

**Arc Lamps:** D. TIMAR and K. VON DREGER [Parallel carbon lamps] 25,045/07.

**Distribution Systems, &c.:** B.T.-H. (*G.E. Co., U.S.A.*) [Control of two or more motors: fields supplied from unipolar generator] 22,868/07.

**Ignition:** P. A. POPPE [Contact maker] 22,808/07.

**Incandescent Lamps:** C. O. BASTIAN and G. CALVERT [Sealing wires of copper or copper alloy into glass] 22,911/06; [As 22,911/06 but for all oxidisable metals] 22,911/06.

**Instruments and Meters:** A. O. BENECKE [Damping vanes and enclosing case] 22,356/02.

**Switchgear, Fuses and Fittings:** W. SCHMIDL and ARMORPACT MFG. CO. [Screwed conduits and junction boxes] 22,789/06; J. S. RAWORTH and A. RAWORTH [Series-parallel motor controllers] 23,075/06.

## LOCAL NOTES

**Accrington: Large Power Supply.**—Messrs. Peebles & Co., of Rishton paper mills, have applied for a minimum supply of 1,000,000 units per annum. A Sub-committee has been formed to negotiate the matter.

**Bedford: Street Lighting.**—The Electrical Engineer recommends mains being laid in certain districts for street lighting, as he anticipates that once the mains are laid for this purpose there will be a good demand for private lighting.

**Dudley: Sale of Electricity Undertaking.**—We announced some time ago that Mr. C. E. Savage, the Council's Chief Electrical Engineer, had accepted a position under the Earl of Dudley at Baggeridge Colliery. The Council have now advised that arrangements should be made for Mr. Savage to devote a certain portion of his time to look after their interests until the undertaking is transferred according to the arrangements which have already been made. The salary proposed for this work is £25 per month. After the transfer it is suggested that Mr. Savage should be retained at an annual fee of £21 for the purpose of inspection in the interests of the Council.

**Liverpool: New Plant at Lister Drive.**—We reported briefly a short time ago that Mr. Harold Dickinson, the recently appointed City Electrical Engineer, had prepared a scheme for the re-arrangement and extension of the generating plant at Lister Drive No. 1 power-house. A 3,500-kw. vertical Curtis turbo-alternator, representing the first portion of a reconstruction scheme prepared by his predecessor in 1911, is at present on order, and when this is delivered the capacity of the station will be 11,000 kw. He also advises the laying down of four additional sets of 5,000 kw. or 6,000 kw. each, instead of two 3,500-kw. vertical Curtis sets as originally contemplated. When the previous 3,500-kw. Curtis turbo-generators were ordered, the British Thomson-Houston Co. gave the Corporation a favourable option in the matter of price for the purchase of two others, but the Engineer considers the larger units as the right policy. Negotiations are being carried on with the B.T.-H. Co. in this connection. The boiler capacity for these extensions, Mr. Dickinson proposes, should be furnished by water-tube boilers, and he suggests the replacement at once of a battery of seven of the existing Lancashire boilers by water-tube, and the ultimate replacement of a further seven boilers as the additional generating plant is installed. Among other alterations proposed is the provision of a sub-station in the old Pumpfields Station, so that the uneconomical steam plant there can be shut down altogether for the greater part of the year.

**London: Woolwich: Development of Electricity Undertaking.**—Apparently great efforts are to be made in connection with Mr. J. F. C. Snell's scheme for reorganising the electricity undertaking, in order to put it upon a sound financial basis. Last week we reported that an offer had been made to the Erith Council to give a supply in bulk, and we now learn that a similar offer is being made to the Bexley Council.

**Wood Green: Electricity Supply.**—Considerable controversy is taking place as to the relative advantages of the supply of electrical energy in this district being in the hands of the Tottenham & Edmonton Gas Co. or the North Metropolitan Electric Power Company. At a public meeting recently the voting went in favour of the latter course after a speech by M. E. T. Ruthven-Murray, Chief Engineer to the Electric Power Company. The Council, who is being advised by Mr. G. W. Spencer Hawes, is at present giving its support to the Gas Company's proposal to acquire their electric lighting Provisional Order for £500.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

[Notes of Contracts Open are not repeated under this heading week by week until the last date for receiving tenders, as is done in some of our contemporaries, but are only inserted once.]

## Generating Stations, Sub-Stations, Mains, &amp;c.

**Aberdeen.**—The recommendation to instal new plant at the power house has now received the sanction of the Corporation. The main cause of the necessity for this new plant is an increase in the consumption of current for power purposes,

some 7,000 h.p. being at present connected to the mains. Approximately 50 per cent. of the motors are hired out. An interesting feature is the large number of electric derrick cranes now being used at granite yards. A supply is contemplated to Banchoory and Ballater, in connection with which high tension cables will be required. Total borrowing powers amounting to £80,000 are to be sought.

**Barking.**—Extensions of the generating plant are under consideration.

**Bedford.**—A loan of £1,800 for house services is to be applied for.

**Bolton.**—A Local Government Board inquiry was held last week concerning an application for powers to borrow £122,200 for the new power station. A period of 30 years was asked for the repayment of the loan. Generation will be at 6,500 volts 50 cycles, and the new works will be linked up with the existing power station. The initial plant will be two 4,000 kw. turbo-alternators, and four water-tube boilers, each capable of evaporating 34,000 lbs. per hour.

**Darlington.**—One 1,000 kw. steam turbo-alternator; one 750 kw. and one 250 kw. rotary converters; one water-tube boiler capable of evaporating 15,000 lbs. per hour. Borough Electrical Engineer. Feb. 17th.

**Derby.**—A 2,000-kw. turbo-alternator is required (see an advertisement on another page).

**Liverpool.**—Considerable extensions are contemplated at the Lister Drive power-house (see under Local Notes).

**London: St. Marylebone.**—Converting plant. General Manager, February 12th. (See advertisement on another page.)

**Oldham.**—A 2,000 kw. generating set is to be substituted for the 1,500 kw. set originally intended in the application for a loan, which will shortly come before the Local Government Board.

**Stoke-on-Trent.**—A loan of £27,196 has been sanctioned for electrical extensions.

**Waterford.**—An electric lighting scheme put forward by Mr. Lawless at an estimated cost of £3,900 has been adopted by the Asylum Board.

**Widnesbury.**—A loan of £3,000 is to be applied for in connection with mains and house service extensions.

**Wrexham.**—Extension of the mains into Rhos is under consideration.

**York.**—The City Electrical Engineer has reported the necessity for a new 3,500 kw. alternator (£14,257); two water-tube boilers, chain-grate, stokers, &c. (£4,170); high-tension cables (£6,551); new battery and battery room (£4,722); stores, sheds (£600). The Electricity Committee recommend the necessary application being made to the Local Government Board.

## Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

**Birmingham.**—New Weights and Measures offices, Corporation Street. City Engineer.

**Bristol.**—Swimming bath. City Engineer.

**Cardiff.**—Thirty workmen's cottages. City Engineer.

**Colchester.**—School in Hamilton Road. Education Offices.

**Falmouth.**—Forty-four houses for the Council.

**Glasgow.**—Cinematograph theatre, Main Street, Pollok-shaws.

**Llanelli.**—New Town Hall.

**London: L.C.C.**—Camberwell and Cressy Road car sheds. February 25th.

**Lewisham.**—The electric lighting of the infirmary is under the consideration of a Sub-committee.

**Manchester.**—Riding school. Colonel Winder, National Buildings, St. Mary's Parsonage.

## Miscellaneous

**Leeds.**—Twelve months' supply of stores for Tramways Department. Tramways Manager, February 17th.

**Leeds.**—Ten new cars are required by the Corporation.

**London: Battersea.**—One year's supply miscellaneous stores for Electricity Department, including meters, joint

**Manchester.**—Twelve months' supply of stores for Tramways Department. Tramways Manager, February 18th.

### TENDERS RECEIVED AND ACCEPTED

**Eastbourne.**—The Corporation have accepted the tender of the British Westinghouse Co. for a 1,500 kw. turbo-alternator, without condensing plant, running at 3,000 r.p.m., at £5,236. The turbine is of the pure impulse type. Fifteen other tenders were received.

**Epsom.**—The tender of the Electric Construction Co. for an electrical pump at the waterworks has been accepted at £368.

### APPOINTMENTS AND PERSONAL NOTES

Mr. H. P. Stokes, on the occasion of his leaving the Ilkeston Electricity Department to take up his appointment as Chief Electrical Engineer at Bexley Heath, was entertained to dinner on January 22nd by members of the Council, and presented with a silver tea urn by the Mayor. He has also been presented with a silver cake basket by the station staff.

The following short list has been chosen from the applicants for the post of Burgh Electrical Engineer at Wishaw:—G. H. Bellwood, Wishaw; W. J. Cooper, Uddingston; William M'Farlane, Holytown; J. W. Slorach, Hamilton; L. S. Thomson, Jordanhill (Glasgow); and S. Williams, Motherwell.

Among the salaries of head officials of the Birmingham Corporation which are being recommended for increase are those of Mr. R. A. Chattock, the City Electrical Engineer, from £1,200 to £1,500, and Mr. H. Foulds, Secretary of the Electric Supply Department, from £600 to £750 per annum.

A new scale of salaries has been established for electrical engineers and assistant electrical engineers under the Admiralty. Electrical Engineers, £450, rising by £20 increments to £650 per annum, with official residence or an allowance of £50 to £75; electrical engineers, lower grades, £300, rising by £15 increments to £400 per annum, with official residence, or an allowance of £50; first assistant electrical engineers, £250 to £350, and second assistant electrical engineers, £200 to £250.

Mr. W. Innes, Assistant Electrical Engineer to the Poplar Borough Council, has resigned.

It is recommended that the salary of Mr. W. Fennell, Borough Electrical Engineer, at Wednesday, be increased from £300 to £325 per annum.

Young electrical engineer required to assist in catalogue and advertising work, by Messrs. Siemens Bros. & Co., Ltd. (See an advertisement on another page.)

Foreman wanted for wiring work. (See advertisement on another page.)

**Obituary.**—The death of the Earl of Crawford and Balcarres, F.R.S., removes one of the founders of the Institution of Electrical Engineers and the first Vice-President (1872-4). At the time of his death Lord Crawford was the senior surviving officer. In 1869, he (then Lord Lindsay) started an electrical laboratory in Eaton Place, and it was there that the first inception of the Society of Telegraph Engineers was made. He was made a Fellow of the Royal Society in 1878, and in the same year was President of the Royal Astronomical Society. For the last twenty-three years he was Chairman of the Governors, Faraday House, where much of his original apparatus is preserved. The Institution of Electrical Engineers was represented at the memorial service in the Chapel Royal, St. James's, on Tuesday, by Mr. W. Judd, Mr. R. Hammond, and Mr. F. R. Rowell.

The death is reported of Dr. G. P. de Laval, well known as the Swedish inventor of the high-speed impulse steam turbine bearing his name. His sphere of activity was wide,

and embraced various chemical and other industries. He was the pioneer of centrifugal separators, constructed a boiler working up to 3,000 lbs. per sq. in., and was connected with a number of manufacturing companies and large electrical power schemes in Sweden.

### MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. Geo. Smith & Son, of 5, Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f., port of arrival, quoted on Tuesday night, was £74 10s. to £75 10s. (last week, £74 15s. to £75 5s.).

**Tantalum and Wotan Lamps.**—Siemens Brothers' Dynamo Works, Ltd. (incandescent lamp and fitting department, Tyssen Street, Dalston), inform us that they have arranged for the production of cinematograph films showing the processes of manufacture of Tantalum and Wotan drawn-wire lamps at the majority of first-class cinema theatres.

**The Langdon Davies Motor Co.**—This company have installed an additional telephone service (City 3888) at their City office, 110 Cannon Street.

**The Machine Tool and Engineering Association.**—The address of this Association is now Queen Anne's Chambers, Tothill Street, Westminster, S.W. (Telegrams: Toolxib, London: Telephone, Regent 125).

**Magic Appliances, Ltd.**—Mr. W. C. Jeary, General Manager, has been elected to a seat on the Board of this company.

**The M.A.N.**—The London offices of the Maschinenfabrik Augsburg-Nürnberg A.G. are being moved next week from the East block to a larger suite on the first floor of the West block of Caxton House, Westminster.

**Electrical Conduits, Ltd.**—We are informed that Mr. J. R. A. Hemming has ceased to represent this company (of 18 Bennett's Hill, Birmingham), and has no longer authority to act for them in any way.

**Osram & Robertson Fancy Dress Dance.**—This annual function was held on Saturday last, and was much enjoyed by the 300 persons present. Prizes were awarded to Misses Ralombo, Brayshaw, Bignell, and Ritchie and Messrs. Woodward and Cook, and were presented by Mrs. C. Wilson. Mr. and Mrs. H. Hirst, Mr. M. Railing, Mr. F. Sells, and Mr. and Mrs. Shepperd were amongst the company.

**The "Mazda Gems" Bohemian Concert.**—An exceedingly successful concert was given by the employees of Mazda House on Monday evening. The musical items and recitations were excellent. Some cleverly-executed caricatures of leading members of the staff appeared on the programmes. A concert of the employees at Rugby was being held simultaneously, and telegrams of greeting were exchanged.

**Who said Strength?**—A coloured gentleman named William Osram was riding on a bicycle when he came into collision with a refuse cart belonging to the Public Health Committee of the Johannesburg Municipality. As has happened with numerous namesakes of his, Osram was undamaged, but he obtained £10 compensation from the Johannesburg Corporation for damage to the machine.

**MARRYAT**  **PLACE**

## SUMMARY

A NEW electric power station has been established in connection with the Swansea Docks. Current at 3,000 volts is generated by turbo-alternators. There are four sub-stations, where the pressure is reduced to 430 volts A.C. or 250 volts D.C. Open-type arc lamps are largely used for lighting, while metal filament lamps have been recently introduced. A number of D.C. cranes are already in use and a 700-ton Scherzer bridge of 100-ft. span is worked through a C.M.B. converter, and has an elaborate system of signalling and interlocking. The fittings and repair shops have been converted from steam to electric drive. Besides

the equipments on the docks a number of works take power for machine tools, cranes, lighting, &c. Witton-Kramer magnets are being adopted for lifting iron pig and scrap. (Page 85.)

THE London County Council has just acquired a new electrically-driven Cedes "turn-table fire escape," in addition to twelve "first-aid ladders" which have been in successful operation for some time past. (Page 88.)

A BURN-OUT of five pairs of 1 sq. in. feeders in Manchester interrupted the supply in one of the sections of the city for 1½ hours last Friday. Although the cables were completely burnt through, normal current was hardly exceeded, and the cut-outs did not act; in fact, the station only knew of the interruption an hour after it had occurred. (Page 88.)

SALFORD Corporation have accepted an offer for supply "in bulk" from the Lancashire Power Co., at an extremely low price. (Page 88.)

A JOINT meeting of the Institution of Electrical Engineers and the Société Internationale des Electriciens will be held in Paris in the last week of May. This announcement was made by the President of the Société, Monsieur Grosselin, at the Annual Dinner of the Institution of Electrical Engineers last Thursday. At the dinner the Postmaster-General proposed the toast of the Institution, and made an interesting statement with reference to the Technical Committee nominated in connection with the consideration of the Marconi contract. (Page 89.)

A NEW 750-kw. triple-expansion direct-coupled set was officially started up at Hornsey on Saturday last. (Page 89.)

MR. F. H. WHYSALL's paper on the results of working of the large Manchester battery has been further discussed by the Manchester Local Section of the Institution of Electrical Engineers. (Page 89.)

A BALANCER starter, a new design of laundry iron, and an improved switch-holder are described in illustrated articles. (Page 90.)

A MEETING was held last week in London in connection with the proposed formation of an association of engineers in subordinate positions in generating stations. (Page 90.)

THE design of generators for use with Tirrill regulators is discussed in our "Questions and Answers" columns. (Page 91.)

WE refer to prospects of considerable extensions of railway electrification in London in the near future, and an important extension of the North-Eastern electric lines. The Melbourne electric railway scheme is also being pushed forward. Some information is given of a large American railway scheme. The Oxford Corporation propose to enforce the penalties for the non-completion of the electric tramways. (Page 92.)

MARCONI's Wireless Telegraph Co. have informed the Government that unless the contract for the pro-

posed Imperial wireless telegraph scheme is confirmed by Parliament by March 1st they will treat it as not binding. An underground telephone cable with Pupin coils is to be laid between Zurich and Basle. An appeal has been entered by the Postmaster-General against the portion of the telephone award dealing with the raising of capital. A large number of automatic telephone instruments are to be used in New Zealand. (Page 93.)

THE Specifications published by the Patent Office on Thursday last included one by the B.T.-H. Co. and E. Garton for a pressure regulator and switching arrangements for automobile lighting from a variable-speed dynamo and accumulator set. Another specification deals with the speed control of two or more induction motors arranged in cascade, by E. Rosenberg, while W. S. Peake protects an emergency calling-up system for wireless stations, and J. H. de Thierry an automatic resetting overload circuit-breaker which only permanently opens the circuit if the overload persists through an adjustable time-limit. (Page 94.)

MR. J. A. BELL, the City Electrical Engineer, Aberdeen, is claiming £1,000 damages against the local Electrical Contractors' Association.—The Scarborough Corporation contemplate purchasing the local Electric Supply Co.—The position of the Walsall Electricity Undertaking is causing some concern.—The Shropshire Power Co. has been deprived of its powers in certain districts recently incorporated in Birmingham.—Good progress is being made with the extensions to the Dundee power station.—A power contract has been entered into in Belfast on the basis of 30s. per kw. per annum, plus 0.5d. per unit. (Page 95.)

Two 8,000-kw. turbo-alternators, rotary converters, and transformers are required by the L.C.C.; two 5,000-kw. turbo-alternators at Stepney; economisers at Shoreditch, and a new generating set at Maidstone. Mains costing £30,000 are contemplated at Rochdale, and £1,000 at Peterborough. Stores are required at Ilford, and electric numns at Hereford. (Page 95.)

A BONUS dividend of 7s. 6d. per share is to be paid by the Chloride Electrical Storage Co., and a dividend of 15 per cent. for 1912 by Messrs. W. T. Henley's Telegraph Works. The Yorkshire Electric Power Co. made a net profit of £7,361 last year. (Page 96.)

## ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, FEBRUARY 13TH.

*Institution of Electrical Engineers.*

8 p.m. "Notes on Parallel Operation," by A. R. Everest.

*Institution of Electrical Engineers: Dublin Section.*

8 p.m. At Royal College of Science.

*Junior Institution of Engineers.*

2.30 p.m. Visit to Osram Lamp Works, Hammersmith.

SATURDAY, FEBRUARY 15TH.

*Institution of Electrical Engineers: Scottish Section.*

Annual smoking concert at the Grosvenor, Glasgow.

*Birmingham and District Electric Club.*

6.30 p.m. Annual dinner at Swan Hotel, New Street.

*Old Centralians.*

6.45 for 7.30 p.m. Annual general meeting and dinner at Trocadero.

MONDAY, FEBRUARY 17TH.

*Institution of Electrical Engineers: Western Section.*

4 p.m. At Bristol University. "Some Uses of the Stroboscope," by Prof. David Robertson.

TUESDAY, FEBRUARY 18TH.

*Institution of Electrical Engineers: Manchester Students' Section.*

7.30 p.m. At Municipal School of Technology. "Time Limits," by H. B. Constantine.

WEDNESDAY, FEBRUARY 19TH.

*Institution of Electrical Engineers: Students' Section.*

7.45 p.m. At Victoria Embankment. "Electricity Supply Policy," by G. W. P. Page.

*Association of Mining Electrical Engineers.*

7 p.m. North of England Branch. At Armstrong College, Newcastle. Paper by Mr. R. Nelson, Chief Electrical Inspector of Mines.

## The London Electrical Engineers.

(TO-DAY) THURSDAY, FEBRUARY 13TH. C. Company.—Company Training, 7 to 10 p.m.

FRIDAY, FEBRUARY 14TH. D. Company.—Recruit Training, 7 to 10 p.m.; Company Training, 7 to 10 p.m.

SATURDAY, FEBRUARY 15TH. Headquarters open for Regimental business from 10 a.m. till 12 noon.

MONDAY, FEBRUARY 17TH. A. Company.—Recruit Training, 7 to 10 p.m.; Company Training, 7 to 10 p.m.

TUESDAY, FEBRUARY 18TH. B. Company.—Company Training, 7 to 10 p.m.

BUILDER to ELECTRICAL CONTRACTOR (who has looked in on newly completed job):—"Look here, the next job you do for me has got to be in casing. I ain't going to waste time and spoil tools trying to get through your infernal tubes. Besides, you can get a fixing in wood! . . . might as well have gas!"

## ELECTRICAL EQUIPMENT OF THE SWANSEA DOCKS

BY the kindness of Mr. D. Fulton (Electrical Engineer, Swansea Harbour Trust) we were enabled recently to examine the interesting electrical equipment which has been completed at the Swansea Docks. It is only about three years ago, when the "King's" Dock was nearing completion, since the first step towards electric power supply was taken, and progress has been rapid. There are now in operation many electric cranes, machine tools, blowers, &c., in addition to the lighting and signalling. An inspection of the sketch plan of the docks, Fig. 1, will show that the Swansea Harbour Trust owns a considerable amount of land, some of which has been recently reclaimed. Many works are being attracted to sites on this land on account of the electric supply available at reasonable rates.

from there by a Gwynne pump connected by a flexible coupling to a motor, which also drives Edwards' air and force pumps through rawhide and cast-iron gearing. The motor for the 810-k.v.a. set is 20 h.p., and for the 440-k.v.a. sets 15 h.p., squirrel-cage type, supplied by Bruce Peebles & Co., Ltd., and controlled by British Westinghouse auto-controllers. When the water in the dock is lower than the circulating-water inlet, the circulating water is supplied by a 12-h.p. Crompton motor-driven Gwynne pump, which can deliver 2,000 gallons of water per min. against a total head of 10 ft. All the auxiliary motors in the station are supplied from a 95-k.v.a. transformer, which steps down from 3,000 volts to 480 volts. The alternators of Bruce Peebles & Co.'s manufacture are star-connected. The rotors are of the cylindrical type, and

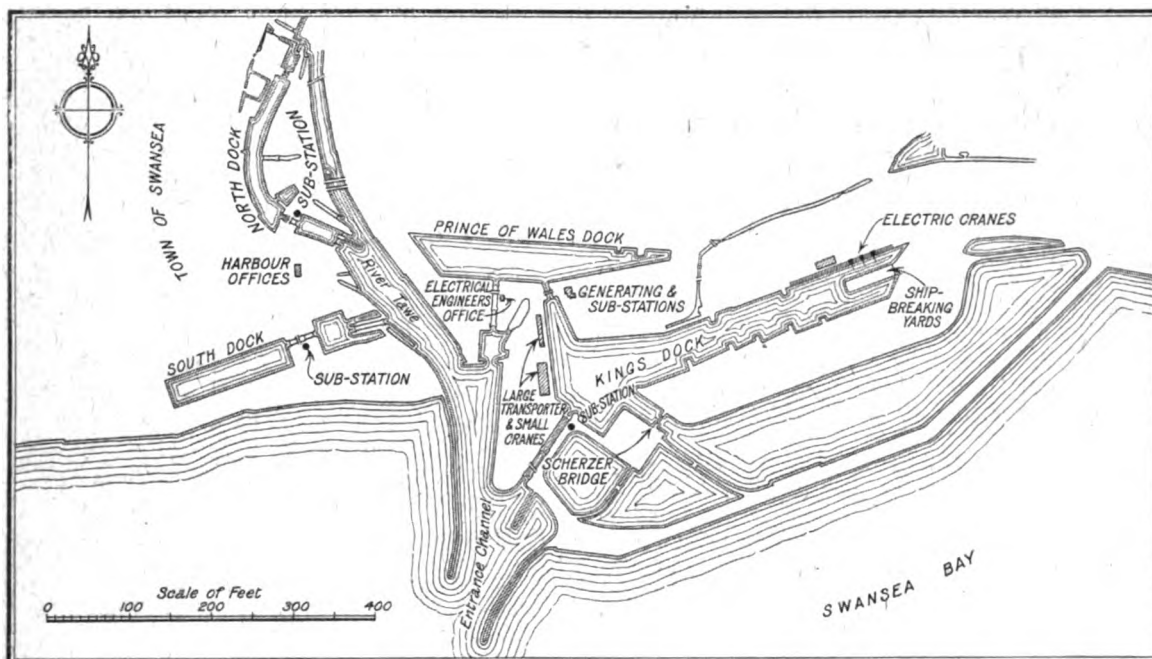

FIG. 1.—SKETCH PLAN OF THE SWANSEA DOCKS.

The original lighting of the docks was carried out by two 150 kw. 100 cycle 2,500 volt single-phase alternators, but on the opening of the King's dock in 1909 it became necessary to increase the supply, and Mr. Fulton, who had just joined the Trust, made arrangements for the loan of the machines used by the dock contractors, while the final scheme matured. The pressure was 250 volts D.C., and this had to be maintained by the new plant.

Power is now generated and transmitted at 3,000 volts three-phase. All motors above 50 h.p. are run at this pressure, while smaller ones are run at 480 volts or else 250 volts D.C. The generating station is on the site of an old hydraulic station, so that any trouble due to uncertainty of foundations was avoided. The generating plant at present consists of one 810-k.v.a. three-phase 50-cycle 3,000-volt turbo-alternator, and two of 440-k.v.a. capacity.

The turbines are of the Willans-Parsons reaction type at 3,000 r.p.m.; the steam pressure is 180 lbs. per sq. in., superheated 150° F. The overload capacity is 25 per cent. continuously, obtained by bye-pass valves, which can also maintain normal full load non-condensing. The main governor acts upon a double-beat equilibrium valve, and controls the turbine within 2 per cent. at all loads. A runaway governor, also workable by hand, comes into action when the speed increases 10 per cent., and cuts off steam. A Willans and Robinson's surface condenser fitted with an augmeter is used. Cooling water is brought from the dock through a culvert into a well, and pumped

the slip-rings are of mild steel. The ventilation is by fans at each end of the rotor, and the air is discharged at top and bottom of the stator-cases. The exciters are of Bruce Peebles multipolar protected interpole type; the regulation is done by rheostats close to the machines on the shunt circuits of the exciters only. Callender's single-core lead-covered 2,500-megohm cables, carried on rack insulators underneath the floor and through ducts, lead to the generator panels. Each set is entirely independent. The main steam pipe and the atmospheric exhaust and condenser pipes are carried under the floor, the valves being operated through extended rods.

The boiler-house is equipped with four hand-fired 30 ft. by 8 ft. Lancashire boilers and Hotchkiss circulators with Sisson superheaters, built by H. & T. Danks, Ltd. (Netherton), and fitted with the "current" incandescent fire bridge. A Green economiser of 288 tubes is placed at the back of the boilers. The main switchboard is on the main floor level, and, together with all the other boards, was supplied and erected by Crompton & Co., Ltd. It consists of three generator panels with exciter panels directly underneath, seven H.P. feeder panels, and four L.P. distribution panels. The board is of the separate compartment type. Isolating switches are fitted to every cell, and are interlocked with the expanded metal doors. The bus-bars are similarly enclosed behind expanded metal screens. A rotary synchroscope, made by Everett,

Edgumbe & Co., is placed on a swivel bracket at the end of the board, and a N.C.S. leakage indicator is mounted under one of the H.P. feeder panels. Arresters of the General Electric Co.'s make, fitted with isolating switches, are mounted on the wall at the back of the board. The power factor of the system is about 0.75, and the installation of a phase advancer is under

FIG. 2.—ELECTRIC GANTRY CRANES AT THE NEW KING'S DOCK.

consideration. The fuel used is ordinary steam coal, and we understand that the generating costs including all charges work out at about 0.5d. per unit. Three-and-a-half lbs. are used per B.O.T. unit generated.

There are four sub-stations, one in the generating station and the others at King's Dock, North Dock, and South Dock. In the first there are two 100-kw. interpole Crompton motor-generators, and in each of the others two 60-kw. interpole motor-generators and a 375-k.v.a. transformer. The H.P. panels are of similar design to the main switchboard. The motor-generators are controlled by oil-immersed auto-transformers.

The whole layout, including that of the generating station, has been effected with the idea of considerable expansion in mind, so that no great difficulty is likely to be met with when further extensions are necessary. The fire risk at the switchboards is small.

The lighting of the dock quays, locks, railway sidings, railway and dock signals, and main roads is by 180 10-amp. Crompton open-type lamps, 55 7.5-amp. Crompton-Blondel flame arcs, and 35 6-amp. Crompton enclosed arcs. The sheds on the King's Dock are lit with open-type arc lamps, and those on the Prince of Wales, North and South Docks by Osram metal fla-

FIG. 3.—UNDERHUNG JIB TRANSPORTER CRANE IN WAREHOUSE ON THE NEW KING'S DOCK.

ment high and low candle-power lamps, as well as the head offices, trustees', workshops, &c. The arc lamps have clear glass lanterns, as the cost of replacement in case of fracture is low. The power supplied to the tenants on the estate is used for sawmills, fuel works, anthracite coal crushing and screening, flour mills, ship-breaking yards, dry docks, &c.

The ship-breaking yards are those of T. W. Ward & Co., Ltd., and the Shipbreaking Co., Ltd. The equipment of the former includes about 250 h.p. in motors, embracing a 40 h.p. shears, a 20 h.p. shears, a 5-ton gantry crane, a 30-ton jib crane, a smaller crane for feeding the shears, a Witton-Kramer magnet,

&c. The latter company have, besides a three-phase ball breaking gear, a somewhat similar equipment, and are, we believe, contemplating very considerable extensions to the electrical equipment. The Great Western Railway Co.'s repair shop takes 25 h.p. for its machine tools, and the company also maintains about 100 arc lamps. The Trust's fitting shops are entirely electrically driven, having three 25 h.p. and two 10 h.p. slip-ring Crompton-protected motors, and one 60 h.p. Peebles slip-ring protected motor, controlled by Ellison oil-immersed gear. The smaller motors drive lathes, a Roots blower for the blacksmiths' fires, punch, shears, plate bending tools in the boiler-makers' shop, a circular saw and wood-working machinery, &c. The 60 h.p. motor drives an air compressor for the hammers in the smiths' shop, and portable pneumatic tools. The costs have been reduced about £5 per week since the three small steam engines were done away with.

The mains are carried on creosoted wooden poles, and are double-braided copper. The H.P. mains are suspended from a No. 8 S.W.G. galvanised steel wire by Henley's rawhide suspenders; the cables going under the dock locks are the British Insulated & Helsby Cable Co.'s paper-insulated lead-covered and armoured. The overhead mains are brought into a galvanised iron cabin at each side of the locks, and connected to the submarine cables through trifurcating boxes. Distributing boards in these and similar cabins in different parts of the estate control the lamps and other circuits.

Three electric cranes, of 2 tons capacity, are in use on the King's Dock (Fig. 2). They were manufactured by C. & A.

FIG. 4.—PORTABLE ELECTRIC SAW BENCH.

Musker, Ltd. (Liverpool), and travel on a gantry 21 ft. high and 52 ft. 3 in. long; this has an overhang over the road of 17 ft., while the radius of the jib is 50 ft. 6 in., and the height of lift 70 ft. For full load the lifting speed is 300 ft. per min.; slewing, 400 ft. per min.; cross travelling, 150 ft. per min.; and longitudinal, 20 ft. per min. The motors are of 60 b.h.p. for hoisting, 5 b.h.p. for slewing, 10 b.h.p. for cross travel, and 5 b.h.p. for longitudinal travel. They are totally enclosed Peebles D.C. interpoles series machines, with a temperature rise of 70° F. at the one hour rate. The controllers are of the British Westinghouse tramway type. Overwinding switches are provided on the hoisting motions, and limit switches on the cross travelling motions. The gearing is cast steel machine cut throughout, magnetic brakes are fitted on the hoisting and cross travelling motions, a foot brake is also provided on the hoisting motions, the magnetic brake can also be released by a pedal, enabling the load to be lowered by gravity. One of the cranes is fitted with a Witton-Kramer 42 in. lifting magnet, controlled by an oil-immersed controller with non-inductive resistance in the driver's cabin. The feeding cable is taken from the cabin to two slip rings enclosed in a spring drum on the jib, and over wooden sheaves to the magnet. The average lift is 16 cwt. of pig iron, out of rough pile in ship's hold into trucks. Whilst unloading a cargo by slings recently, one lift was dropped into the dock. The magnet afterwards lifted it out. An installation of three jib cranes is projected. In a shed on King's Dock, 400 ft. long and 60 ft. wide, is a 3½ ton overhead travelling crane with underhung jib (Fig. 3), manufactured by Herbert Morris & Bastert, Ltd. (Loughborough). It has been working for about three years, and has four motions, longitudinal and cross transverse, hoisting and slewing. The full load speeds are:—Hoisting, 45 ft. per min.; longitudinal travel, 500 ft. per min.; cross travel, 125 ft. per min.; slewing, 250 ft. per min. The h.p. of the motors, one hour's rating, is:—Hoisting, 20; longitudinal travel, 20; cross travel, 5; slewing, 5. An overwinding switch is con-

nected in the hoisting motion, and a limit switch in the cross travelling motion. The motors are series wound and protected, and, together with the tramway type controllers, are of British Westinghouse make.

Two of the dock sheds are equipped with 1-ton Crompton overhead electric runways, electric hoist and push travel. Ball bearings are used throughout.

FIG. 5.—100 FT. SPAN SCHERZER BRIDGE WITH C.M.B. CONTROL.

A considerable amount of pit props is imported into the port, and is sawn up to order on the estate. A portable electric saw bench (Fig. 4) installed some time ago, has been very successful; another one is now on order. The present one was supplied by W. V. Waite & Co., Ltd. (Taff Wells, Cardiff), and built by Broome & Wade, Ltd. (High Wycombe). The saw is driven through a Hans Renold chain by a  $7\frac{1}{2}$  b.h.p. Peebles totally enclosed compound wound interpole motor. Current is obtained from the lighting mains, through a trailer cable, which is plugged into ironclad Berry Skinner D.P. switch-fuses, mounted on the lighting poles.

The generating station and five hydraulic stations are ventilated with 36 in. Verity's exhaust fans, two of the hydraulic stations have Davis Perrett electric oil-eliminating plants, the boiler feed is taken from the hot well by small high-speed pumps, driven by General Electric Co.'s motors.

FIG. 6.—INTERIOR OF SCHERZER BRIDGE CONTROL CABIN.

Between the King's Dock and a lay-by dock a Scherzer single road and railway bridge with a span of 100 ft. crosses the lock. Fig. 5 shows the bridge open and Fig. 6 the interior of the control cabin. It is balanced with 340 tons of concrete. The electrical equipment consists of a Crompton C.M.B. motor generator, and a main driving motor. Current is supplied to the switchboard at 250 volts D.C. One machine of the C.M.B. equipment is driven as a motor and the other as a generator, which has special windings for limiting the maximum current taken by, and for regulating the pressure on, the main motor, which drives the bridge through gearing.

In case of breakdown the bridge can be worked by hand. The motor is 40 b.h.p. and runs at 500 r.p.m. A magnetic brake works on a brake sheave keyed on to the motor shaft. This brake has hand-release, and is released on the first point of the controller without influencing the motor. Speed control of the motor is obtained by varying the field of the generator, which in turn controls the main motor circuit pressure from zero to a maximum of 480 volts. The controller is incorporated with a reversing switch, and consists of a multiple contact switch; each contact is connected to a resistance unit. Fig. 7 gives the connections of the control and signalling circuits. A pedal switch is placed at the foot of the controller and mechanically connected to it so that it is impossible to work the switch until the controller is in the "off" position, and the brake on. Moving the controller to the first notch releases the brake, and full field is given to the generator which at once builds up an

FIG. 7.—CONNECTIONS IN SCHERZER BRIDGE CONTROL CABIN.

opposing pressure equal to the line pressure, so that although the main circuit is closed, the voltage at the motor is zero. Moving the controller weakens the opposing field of the generator until in the neutral position the full line voltage is applied to the driving motor; in this position the motor will run at half speed. A further movement of the controller reverses the generator field. Limit switches are mechanically operated by the movement of the bridge, at a position 6 ft. from the full-closed or full-open position. The action of operating this switch in either direction opens the brake and field circuit, so that the generator volts are built up in opposite directions and the voltage of the main motor circuit immediately drops to zero. In order to operate the bridge with the limit switches in this position, the pedal switch is depressed, re-making certain of the field circuits which are independent of the controller. As the pedal switch cannot be opened until the controller is in the off position it is impossible to apply the full field instantaneously. The main switchboard consists of one D.P. knife switch and enclosed fuses, one ammeter, a locking bolt indicator, a 1.5 ampere D.P. switch for cabin lighting, one D.P. 5 ampere switch for indicator circuit, a 1.5 ampere D.P. switch for the locking bolt, and a 1.5 ampere D.P. switch for the bell circuit. For indicating the position of the bridge, switches are provided on it, which, when operated, light a lamp and ring a bell

in the cabin. This indicates the nearly-home and full-home positions. The locking-bolt indicator shows on a dial whether the bolt is in or out. The whole, along with the C.M.B. motor generator and main controller, are installed in a cabin from which a full view of the operation of the bridge can be gained. The whole of the electrical equipment of the bridge was supplied and erected by Crompton and Co., Ltd. (Chelmsford), and the bridge was constructed by Sir William Arrol and Co., Ltd. (Glasgow).

## A NEW ELECTRICALLY-DRIVEN FIRE ESCAPE

THE London County Council has just taken delivery of an electrically-driven fire-escape of the kind known as a "turn-table ladder." It was supplied by Cedes Electric Traction, Ltd. (112, Great Portland Street, W.), as were twelve "first-aid ladders" like the one described in *ELECTRICAL ENGINEERING*, Vol. VIII., March 23rd, 1911, p. 153. The chassis construction is well shown in the illustration. The Tudor battery is similar to those used in former escapes, except that some mechanical improvements have been made. It is placed under the seat instead of in the bonnet. The capacity of the battery is 200 ampere-hours at the four-hour rate, and its weight complete is 26 cwt. The hub-driving motors are of 20 h.p., as were those used originally, but by alterations in one or two details greater speeds have been obtained. The total weight with complete equipment is six tons, of which the ladder is responsible for one ton.

CHASSIS OF ELECTRICALLY-DRIVEN TURN-TABLE FIRE-ESCAPE FOR THE L.C.C.

When fully extended it is 90 ft. high, and can be raised in 90 seconds by a 6-h.p. motor. The controller is fixed to the back of the framework, but is not shown in the illustration. A feature of all Cedes controllers is that the fingers are separately detachable, being fixed by a spring and small screw. Three raising and three lowering speeds are provided for. A limit switch, seen by the hand-brake handle in the illustration, prevents overrunning. The swivelling motion is carried out by hand. To obtain rigidity when the ladder is to be used, the chassis is jacked up by four jacks fitted with swivel heads and coarse adjustments, as well as a convenient hand-wheel for the final adjustment. It is said that ten seconds is sufficient time to take the jack from its housing immediately above the point of application, and to jack up the chassis. The following speeds were guaranteed: 21 m.p.h. on the level and 12 m.p.h. up Pentonville Hill, but 25.5 and 16 m.p.h. were actually attained. Similarly the more recent of the "first-aid" ladders supplied attained a speed of 28 m.p.h. on the level against a guarantee of 25. The batteries will run for 5,000 miles before new positive plates are required, while the negative plates last twice this time.

**Low and Mixed Pressure Turbine Plant.**—A long Paper on this subject was read by Mr. C. H. Goulden before the Students' Section of the Institution of Electrical Engineers on February 5th. The author dealt with the advantages of exhaust steam turbines as regards economy and freedom from blade stripping and other possible sources of breakdown. Suitable vacua might be taken from 27½ in. as a low limit to 29 in. as a maximum. Condensers, heat accumulators, and mixed pressure sets were also discussed, and a description of the governing gear was given. In the discussion, the Chairman, Mr. H. Brazil (Charing Cross, West-End and City Electricity Supply Co.), raised the question of the possibility of obtaining better results by the installation of a battery in certain cases.

## MAINS BREAKDOWN IN MANCHESTER

ON Friday last one of the sixteen sections of the Manchester distributing network was deprived of its supply from 9.15 to 11 p.m., owing to a breakdown on a feeder, which spread to four other pairs of feeders and yet did not cause a sufficiently serious short-circuit to throw out the cut-outs at the station. The area affected was bounded by the lower end of Market Street, Corporation Street, Fennel Street, and Witty Grove.

In Manchester the sixteen sections of the D.-C. network are all separate and not interconnected, and each is supplied by its own set of feeders. To the one in question there were five pairs of 1 sq. in. feeders, all laid in the same cutting and some in the same troughing. The cut-outs for each of these were set at about 1,500 amperes. A fault developed on one of the positive feeders and spread to all the others and burnt them completely asunder, so that the section of the distributing network was completely cut off. At no time, however, did the feeder ammeters register much more than normal load, although the current was, of course, observed to be unsteady, and actually the first notification received at the station of an interruption of supply was a telephone message from a consumer a whole hour after the fault had first developed. The cables in question are V.B. unarmoured, laid solid in bitumen. They are amongst the cables laid in the Manchester central area in 1893, and as they had fallen in insulation considerably of late, they were already on the point of being replaced. The particular feeder which burnt out was to have been replaced at the crossing by a new lead-covered paper-insulated cable during the Friday night following the burn-out, and the electricity department had been at work for a week or two in Mosley Street, driving a new heading under the tram lines to accommodate ducts for the replacement of some, and eventually all, of the ten cables in question.

The two newspaper offices located in the faulty area, viz., the *Manchester Guardian* and the *Manchester Courier*, were never without their 400-volt power supply, owing to special alternative feeding arrangements. The *Courier* office was, however, deprived of its 200-volt supply, which the *Guardian* should have been able to secure through the special balancer installed on their premises for this very purpose. The railway stations at Exchange and Victoria are also provided with alternative feeding supplies.

## SALFORD CORPORATION TO BUY "IN BULK" FROM A POWER COMPANY

AT a meeting of the Salford Corporation yesterday a report of the Electricity Committee was adopted, recommending that a tender for the supply of current by the Lancashire Power Co. should be accepted. Current will be delivered at extra high tension at the boundary of Salford and Swinton, and the charge will be £3 per kw. of maximum demand for the first 1,000 kw., and £2 per kw. for any additional demand up to 3,000 kw., plus ½d. per unit., on the basis of a supply for two or more years. (For one year only the kw. charge would be £6.)

A tender had also been invited from the Manchester Corporation, but the Committee reported that "the terms offered were so much higher that the Committee consider it unnecessary and undesirable to quote them."

The position was one of considerable difficulty and delicacy to all parties concerned. Mr. C. D. Taite, who is Engineer-in-Chief to the Lancashire Power Co., is Consulting Electrical Engineer to the Salford Corporation, and thus was unable to issue the specification or to adjudicate upon the tenders. No specification in the true sense of the term was issued, however, but the tenderers were asked to quote for (1) a minimum demand of not less than 1,000 kw., (2) an additional demand of 1,000 kw. on not more than fifteen minutes' notice, and (3) a further demand of 1,000 kw. on one calendar month's notice. Obviously this might imply a fixed minimum demand of 1,000 kw. and what is practically stand-by for a further 2,000 kw. It seems reasonable to suppose from the price tendered by the power company that they considered that the full supply would be required, and not merely stand-by for the 2,000 kw.; while, presumably, the Manchester Corporation, having no guarantee, found it necessary to take account of the latter contingency.

The present capacity of the Salford electricity works is about 9,000 kw., including all reserve plant, and the bulk supply is intended in the first instance to be supplementary to this.

## ANNUAL DINNER OF THE INSTITUTION OF ELECTRICAL ENGINEERS

IN proposing the toast of the Institution of Electrical Engineers at the annual dinner, which took place last Thursday, Mr. Herbert Samuel, the Postmaster-General, made an interesting statement with regard to the Technical Committee appointed in connection with the consideration of the agreement between the Post Office and the Marconi Company. Mr. Samuel said that it was no easy matter to select members for this Committee, as it was necessary to combine competence, independence and impartiality. Mr. Duddell had the distinction of being the inventor of the "singing arc," and so great was their confidence in his impartiality that, in nominating him for this Committee, they had only feared that he might feel biased against the system [the Poulsen system] based upon his invention. In the course of his speech Mr. Samuel also referred to the rapid comparative growth of the electrical industry in this country as compared with that of the United States. In 1903 the exports of electrical machinery of all kinds from this country amounted in value to about £400,000, compared with about £1,000,000 in the United States. In 1911, however, our exports had risen to actually more than those from the United States, viz., £1,791,000 as compared with £1,700,000 in the United States.

Professor John Perry, in proposing the toast of the guests, said that it was a characteristic of the scientific engineer that he always talked and thought "shop," and that was the reason of his success. He referred sarcastically to the people who always stated that new inventions had been anticipated in past ages, and said that if this had been so we should have been left without an ounce of coal to-day. He also referred to the remarkable fact that some of the most eminent men in this country had no knowledge of science at all. The British Post Office, however, had, in his opinion, shown more enterprise in introducing new inventions than any telegraph or electrical company in the world.

Lord Justice Buckley responded on behalf of the guests, as did also Monsieur Grosselin, President of the Société Internationale des Electriciens, and Herr Geheimrat Christiani, President of the Verband Deutscher Electrotechniker. Monsieur Grosselin made the interesting announcement that his Society had invited the Institution to attend a general meeting with them next May, when there would be papers and discussions on electric traction, wireless telegraphy and other subjects, and visits to electrical works. We understand that the Institution has now definitely accepted this invitation, and the meeting will be held in the last week of May, probably from Wednesday to Friday inclusive.

## NEW PLANT AT THE HORNSEY GENERATING STATION

THE inauguration of the new 750 kw. set at the Hornsey generating station took place last Saturday. A Belliss and Morecom triple expansion engine of the latest design, with automatic expansion gear and oil pressure control running at 250 r.p.m., is direct coupled to a ten-pole interpole shunt generator, by the Electric Construction Co. The engine has a special graphite and oil lubricator by Knowles & Wollaston. As the cost of water for condensing purposes is excessive, a turbine was not adopted, and a barometric jet condenser by The Mirrlees Watson Co., Ltd. (Scotland Street, Glasgow), is installed. Two Rees Roturbo pumps driven by the same 28 h.p. motor by Bruce Peebles & Co., Ltd. (Edinburgh), are used: one supplies the condenser from the cooling tower ponds, and the other pumps the hot well water from the cooling ponds to the top of the cooling towers. Interposed in the 20 in. exhaust main near the engine is a large Baker oil separator. To provide against failure of the vacuum due to heating of the condenser owing to cessation of the water supply, a 2 in. supply is laid on from the New River, and is controlled from the engine room. The make-up water from the cooling ponds is also supplied by this means. Water for the boilers from the hot well is delivered by a Rees Roturbo motor-driven pump delivering up to 2,000 gallons per hour. In order that this hot well water may be delivered proportionally to the load on the engine, a controlling resistance connected in the shunt circuit of the motor pump is fixed near the main stop valve of the engine, and is adjusted by the driver according to the steam pressure. The switchboard extensions consist of a dynamo panel and two feeder and bus-bar panels, by Spagnoletti, Ltd.

In addition to the above plant, an electrically-driven Rees Roturbo 3-stage centrifugal feed pump has been installed. It

will deliver 3,000 gallons per hour into the boilers against a steam pressure of 180 lbs. per sq. in., and runs at a speed of 2,000 r.p.m. The peculiarity of this type of pump is, that it is self-regulating to a large extent, and in the case of a stoker inadvertently closing all check valves, the rise of pressure is only small. Other recent extensions consist of a further Babcock & Wilcox marine type boiler evaporating 15,000 lbs. of water per hour with hot feed. To accommodate this the boiler house was enlarged, and will take a similar boiler, while the engine room will now take two additional 750 kw. sets.

The extensions of plant have all been carried out under the direction of the Borough Electrical Engineer, Mr. Norman Staniland, and the staff at the Electricity Works.

## THE LARGE CENTRAL STATION BATTERY AT MANCHESTER

MR. F. H. WHYSALL'S Paper on "The Use of a Large Lighting Battery in Connection with Central Station Supply" was discussed at a meeting of the Manchester Local Section of the Institution of Electrical Engineers on January 28th. (A report of the discussion in London appeared in ELECTRICAL ENGINEERING, January 30th, page 59).

Mr. S. J. Watson (Borough Electrical Engineer, Bury) considered that as the peak load lasted about an hour and a half, a battery should be given a two-hour rating; on this basis, the cost of the Manchester battery worked out at £10.7 per kw., while modern generating plant would cost about £10 per kw., so that the difference in first cost was slight. He considered large batteries should always be kept on the bus-bars. The battery cables were a heavy item in the installation cost. The capacity on a two-hour rating should be equivalent to that of the largest machine. Alderman Walker (Manchester) considered twenty years as loan period for generating plant too long, as now only about seventeen years was allowed on turbines, while the period for boiler plant was even more restricted. This, however, only made the case more favourable for the battery. Mr. E. C. McKinnon (Chloride Electrical Storage Co.) said that in America batteries were chiefly used as stand-by plant. Makers there made their maintenance guarantees contingent upon the maximum number of charges and discharges, usually on a basis of 150 to 200 in five years, or about forty times per year. During a severe storm recently, the load on the New York Edison Co.'s stations increased from 75,000 kw. to 125,000 kw. at the rate of 5,000 kw. per min. In a case like this, engines could not be put on quickly enough, and the demand was met by the batteries, of which there were twenty-five at various points, representing 17,000 kw. At the end of its useful life a battery was still worth about 25 per cent. of its original value in the scrap metal. Mr. P. P. Wheelwright (Borough Electrical Engineer, Blackburn) considered a battery an advantage from the smoke nuisance point of view. Batteries were now built on sounder lines than formerly. The present battery at Blackburn worked hard, and the maintenance during the four years it had been installed was negligible. Mr. S. L. Pearce (City Electrical Engineer, Manchester) pointed out that on the very worst case for the Manchester battery there was a saving of £2,000 in its favour. The total units lost in the booster and battery were 700,000 units per annum, but the saving in coal alone covered this four times over. The design of the switchgear had given rise to more anxiety than any other detail of the installation. They decided to treat the battery board as a high-tension one, and to put the switches in separate brick cubicles. Remote control circuit breakers should always be installed as near as possible to the battery terminals. They were arranging now for control of their circuit breakers from more than one point for emergency tripping. Mr. C. L. E. Stewart (Borough Electrical Engineer, Rawtenstall) spoke of satisfactory experience with a battery. Mr. Bertram Thomas pointed out that there was no recognised basis on which to determine the size of battery most satisfactory, and suggested that some of the economies at Manchester were due to causes other than the battery, as they began to appear the year before the battery was installed. Mr. A. G. Cooper (Borough Electrical Engineer, Colne) considered that to put in a battery equal in capacity to the largest generating unit was unwise, as it would be in most cases too small before its loan period was up. Mr. W. Cramp (Manchester Municipal Technical School) had found that makers would only guarantee 80 per cent. or 90 per cent. of the rated capacity over a maintenance period. Mr. Whysall replied briefly.

**I.E.E. Students' Section.**—Further changes have become necessary in the officers of the committee of the Students' Section of the Institution of Electrical Engineers, consequent upon the election of Mr. D. Betts (vice-chairman) as Associate Member. Mr. G. W. P. Page has been elected vice-chairman in place of Mr. Betts, and Mr. E. T. Driver (24 Bradgate Road, Catford, S.E.) has been elected honorary secretary.

BALANCER STARTER.

### A BALANCER STARTER

ONE of the disadvantages of balancer starters fitted with "no-volt" releases, is that the starter may be knocked into the "off" position, or may open on account of vibration when running, with the result that in the event of the system being much out of balance the side which is lightly loaded may have its lamps burnt out. To overcome this difficulty, the General Electric Co., Ltd., have recently designed and patented a type of starter which avoids the use of a no-volt release. The arrangement consists of a main switch, which is interlocked with a starter so as to ensure that the starter must be in the "off" position before the main switch is closed; and if the main switch is opened when the starter is in the full "on" or any intermediate position, it cannot again be closed until the starter arm is moved to the "off" position. One form of this starter is illustrated here.

### LAUNDRY IRONS

THE General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), have brought out an improved pattern of electric iron, specially designed for laundry work.

Following the general design of the "Magnet" domestic iron, the laundry iron is equipped with a replaceable heating element disposed so as to give a uniform heating effect over the whole area of the face, and clamped so tightly to the sole that the heat transmission is as perfect as can be desired. The element is formed of a special metal resistance strip mounted on mica, which arrangement lends itself well to a close application to the sole plate. Careful attention has been given to the toe of the iron, and the sharp point which is essential to the successful treatment of many classes of work

THE MAGNET LAUNDRY IRON.

is not secured at the expense of an inadequately heated toe.

Care has also been taken in the design of handle, which not only gives good heat insulation, but is so shaped that the hand and arm assume an easy position, partly owing to the handle being slightly sloped backwards.

Three weights of "Magnet" laundry iron are obtained, weighing 6 lbs., 7½ lbs., and 9 lbs., each of which is stocked in pressures of 100 to 110, 200 to 220, and 230 to 250 volts. The 6 lb. iron takes 500 watts, and the 7½ and 9 lb. sizes 600 watts.

"The Queen's Engineering Works Magazine."—We have received from W. H. Allen, Son & Co., Ltd. (Bedford), a copy of this interesting and well-illustrated magazine, which is published primarily for the purpose of circulation among the old pupils and apprentices of the firm with the object of keeping them in touch with the company. Messrs. Allen hope that such old students whom they have lost sight of will communicate with them on seeing this notice with a view to obtaining a copy. The number before us contains several interesting articles on engineering work in various parts of the world, and news as to the doings of many who received their practical training at the Queen's Engineering Works, Bedford.

### A CHAIN-PULL SWITCH-HOLDER

THE British Thomson-Houston Co., Ltd. (Mazda House, Upper Thames Street, E.C.), have introduced a new pattern of switch-holder which has some marked advantages over the ordinary key-holder, with its stiff, jerky action. The new switch, of which the company have sent us a sample, is worked by a beaded chain, and alternate gentle pulls of the chain switch the lamp on and off. The ratchet action by which this is accomplished will be understood from the illustration.

CHAIN PULL SWITCH-HOLDER.

The action is very easy, and the chain is more readily taken hold of than the usual key, only one hand being required. Twelve inches of chain are usually supplied, and the device should be useful for a variety of different kinds of fittings. The contractor who fits a B.T.H. full-chain switch-holder to a table standard, and keeps it standing on his counter is sure to make sales to many people who pull the chain out of curiosity and then want to buy the whole equipment.

### THE ASSOCIATION OF ELECTRICAL STATION ENGINEERS

A MEETING of members of the staffs of electricity supply stations in the London district and others was held last Thursday in connection with the formation of an association with the above title. Mr. C. F. Wade (Shift Engineer, Islington Electricity Works) was in the chair, and between 30 and 40 persons were present. Mr. W. J. Ebben (7 Vernon Road, Stratford), who is acting as hon. sec. to the movement, made a short speech outlining the inception of the scheme, which, although originating in London, where a preliminary meeting had been held already, was being pushed forward all over the United Kingdom. A meeting was to be held in Dublin the following day, and similar meetings would take place soon in Manchester and Glasgow. Since the original announcements were made a large number of inquiries have been received, and there were some 2,000 who would probably become members. The Association is not to be conducted on trade union lines, and its objects as defined at the last meeting are:—"To raise the efficiency and general status of members of the Association; to provide means for social intercourse among its members, for their improvement, advancement, and recreation; to form an information bureau for the general assistance of members and employers." It was decided at the meeting that the subscription should be 10s. 6d. per annum, payable in two half-yearly instalments, with an entrance fee of 2s. 6d. The affairs are to be managed by a committee of 24, of whom 12 form a quorum, but for certain reasons the names of the committee are not to be published. A provisional committee of 18 was elected and empowered to elect members to the Association, and draw up a scheme of organisation. The finances of the Association are to be in the hands of a chartered accountant.

**Club Lighting.**—The British Thomson-Houston Co., Ltd. (Mazda House, Upper Thames Street, E.C.), have sent us some particulars of the lighting installation recently carried out at the Cavendish Club, Piccadilly, for which they supplied the whole equipment. This forms a good example of modern efficient methods at the same time in keeping with club traditions. In all, 149 Mazda lamps of various sizes are used, and 141 Holophane reflectors have been installed. Wherever possible, the lamps have been fixed well above the line of vision, so as to minimise the effects of glare. In the dining-room a number of three-light cluster fittings, equipped with Mazda lamps and Holophane reflectors, are employed, and the illumination is uniformly brilliant over the whole room.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelopes.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,326.

It is required to erect a simple wireless receiving apparatus for experimental work, and some information on the following points is requested:—(1) What apparatus is necessary for enabling messages to be received up to about 500 miles? (2) The approximate length of aerial wires necessary, and whether it matters whether these are run vertically or at a sharp angle to the ground? (3) Can a suitable coherer be made by an amateur? If so, give particulars. (4) Is a telephone receiver sufficiently sensitive to be connected directly across the coherer without any other instrument, to enable messages to be received? Assuming that this apparatus is fixed on a hill some 600 ft. above sea-level, will it be too high for satisfactory working?—WIRE.

(Replies must not exceed 1,000 words.)

(Replies must be received not later than first post, Feb. 20th.)

### ANSWERS TO No. 1,324.

What is the best method to follow in the construction of a generator for use in connection with a Tirrill or other voltage regulator, where wide variations in the load take place, and where these are sudden and frequent, and sometimes of very short duration?—B. T.

The first award (10s.) is given to "M. M." for the following reply:—

When it is intended to employ a separate regulating device with an alternating current generator, it is possible to cheapen the design of the generator considerably. For an alternator to have good voltage regulation its windings must be of low resistance, it must have a large number of armature slots per pole, and have a liberal pole pitch. To meet these three conditions will necessitate a larger machine, for any given output, than where voltage regulation is not of prime importance; there will therefore be a proportionate increase in the first cost of the machine. If, however, we can govern the terminal voltage by means of an outside source, it will be possible to have a cheaper design of generator. Although the question of power factor largely increases the difficulties of voltage regulation in the case of alternating current generators, in order to have good regulation with both A.C. and D.C. machines, practically the same conditions with regard to design must be observed. Armature resistance must be low and ampere turns per pole a minimum; therefore, in either A.C. or D.C. machines good voltage regulation can only be secured by expensive design. On the other hand, if we are to have the assistance of a regulator, a cheaper design of generator can be employed; any shortcomings on the part of the machine being met by the regulator. The fact that a Tirrill regulator is unaffected by the power factor of the load gives it a great advantage over self-contained methods of voltage regulation; the various arrangements for compounding alternating current generators are both complicated and expensive.

[It might also be remarked that a machine constructed on these lines will have a lower short-circuit current than one specially designed for close inherent regulation.—Ed., E.E.]

The second award (5s.) is made to "Ohm," who writes as follows:—

Speaking generally, the Tirrill Regulator will give satisfactory results when used with almost any type of generator or exciter, irrespective of their individual characteristics. The makers specify, however, that the exciter voltage at full load must not be more than twice the voltage at no-load. This is really the only point that has to be borne in mind by the designer of the generator. Assuming that the specified range in the exciter voltage has been exceeded, the makers are prepared, as a rule, to consider the proposition and to put forward a scheme. The problem of adapting the Tirrill regulator to meet such a case presents certain difficulties, and as a result the cost of the Tirrill regulator outfit would be more than if the exciter voltage had been kept within the prescribed limits.

Another point of secondary importance is that the exciter field rheostat must be of sufficient capacity to reduce the generator voltage to at least 35 per cent. of normal at no-load, when the whole of the resistance is inserted. The exciter should be shunt-wound, and whilst a compound exciter will in most cases give equally good results, the additional winding is quite unnecessary, and only means extra expense and complications which are quite unwarranted. The poles can be either solid or laminated, but as a general rule the Tirrill Regulator will come out cheaper if the former construction is adopted.

## CATALOGUES, PAMPHLETS, &c., RECEIVED

**CABLES.**—An ingenious two-colour folder calls attention to an order for 1,115 miles of Armorduct vulcanised rubber cable, which has been placed by the Postmaster-General of New South Wales with the Armorduct Manufacturing Co., and gives an idea of the distance by means of maps.

**ELECTRIC MOTOR SYRENS.**—A new catalogue of syrens driven by electric motors, for loud and penetrating signals for factories and other purposes, is being issued by Siemens Brothers & Co., Ltd. (Woolwich). These are compactly arranged, and can be controlled so as to give sharply defined signals. When used as fire-alarms they can be started by push buttons from any number of points.

**HOLOPHANE PENDANTS.**—A number of designs of pendants, ceiling fittings, &c., for holophane bowls, spheres, and stiletto reflectors for semi-indirect lighting, are illustrated in a new catalogue just issued by the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.). These include some handsome designs, and the illustrations do them full justice.

**INSULATING MATERIALS, &c.**—Messrs. Carson and Evans (3 Fenchurch Buildings, E.C.) send us a copy of a card which they are issuing to call attention to the high quality of the ebonite and vulcanite which they supply, and also a folder giving some particulars of a new and cheaper material which they are supplying, where something is wanted at a lower price than ebonite or vulcanite, under the name of Carvanite. Those interested are invited to write for samples.

**INTERCOMMUNICATION TELEPHONES.**—A finely got-up catalogue from the British L.M. Ericsson Manufacturing Co., Ltd. (4 Chancery Lane, E.C.), deals with intercommunication telephone sets of all types and sizes. A special feature is made of a "secret" intercommunication system in which overhearing or interruption is impossible. This can also be used in conjunction with exchange connections. Junction boxes, multiple cables, and other accessories are included.

**CINEMATOGRAPH MOTOR GENERATORS.**—Several patterns of these sets for converting from alternating current, as well as for obtaining lower continuous voltages, are dealt with in a leaflet from the Electric Construction Co., Ltd. (Dashwood House, 9 New Broad Street, E.C.).

**CALENDAR.**—The Electrical Accessories Supply Stores (9 Queen's Terrace, Sheerness-on-Sea) send us a pretty little calendar for 1913.

**ARC LAMPS.**—A price list from Siemens Brothers Dynamo Works, Ltd. (Supplies Dept., 38 and 39 Upper Thames Street), gives particulars of a new pattern of double enclosed alternating current long burning flame arc lamp. The lamp is specially suited for the lighting of large open spaces on account of its long burning hours, low carbon consumption, and economy in current, while its convenient size, not exceeding 3 ft. overall length, renders it also quite suitable for shop lighting.

**METAL FILAMENT LAMPS.**—The Electrical Co., Ltd. (122-124 Charing Cross Road, W.C.) have just issued a new booklet dealing with Aegma drawn wire lamps for all purposes, including plain and twisted flame, tubular, and traction lamps. The booklet also refers to "Goliath" holders and shades for 600 and 1,000 c.p. lamps. The company announce that they hold stocks of Osram, Mazda, Wotan, and Tantalum lamps, and they give some interesting notes on lamp manufacture.

## ELECTRIC TRACTION NOTES

The half-yearly meetings of several of the London suburban railways companies which have just been held, all point to the possibility of great developments of electric traction in the near future. Following on the successful working of the single-phase line of the London, Brighton & South Coast Railway, the Company has, as we have already pointed out, decided to make considerable extensions of the system, and close upon that comes the announcement that the London & South-Western Railway Co. have decided almost at once to proceed with the electrification of the lines on the north side from Waterloo to Hounslow, Shepperton, Kingston, and Hampton Court. The complete scheme originally included the southern lines as far as Guildford, but for the present that portion will be developed by an improved steam service. An expenditure of £1,000,000 is contemplated upon the electrification scheme. The work of conversion of these lines will probably be accelerated by the satisfactory results of the extension of the Central London Railway from the Bank to Liverpool Street, the increase in receipts on this line for the past year having been no less than £5,222, which is mainly attributed to the extension. In the North of England, the North-Eastern Railway Co. have decided to electrify their mineral line between Shildon and Newport (Middlesbrough), a distance of 18 miles. This company has decided to build 10 electric goods locomotives at Darlington, the electrical equipment of which has been placed in the hands of Messrs. Siemens Bros. Dynamo Works; the contract for the equipment of the permanent way has also been placed with the same firm. An important announcement is expected on this subject at the forthcoming meeting of the Midland Railway.

A Paper by Mr. R. A. MacMahon entitled "The Rolling Stock Equipment of the Electric Railways of Great Britain" was read before the Students' Section of the I.E.E. a short time ago. In the course of the discussion the chairman, Mr. Roger T. Smith (Electrical Engineer, G.W.Rly.), said that the similarity of the rolling stock of the British electric railways was largely due to the fact that electrification had taken place on practically each one of the sixteen railways mentioned in the Paper so as to get a more rapid service than formerly. The question why locomotives had been adopted for the electrification of the Berlin "Stadt-Ring und Vorortbahn" (ELECTRICAL ENGINEERING, Dec. 6th, 1912, p. 696, and Jan. 16th, 1913, p. 40) was raised in the discussion, and Mr. Roger Smith mentioned the following factors as probably influencing the authorities: Increased height of centre of gravity and therefore smoother running; possibility of using entirely spring-suspended motors; ability to use wheels of larger diameter and a much larger wheelbase. He was himself in favour of increasing the wheelbase on all motor trucks up to 10 ft. 6 in. or higher. Another reason was probably that with the extremely heavy trains run in Berlin it would not be possible to get single-phase motors on motor-coaches. He cited a case on the Metropolitan Railway where an old car was equipped with motors in the cab so as to raise the centre of gravity; the life of the wheels was doubled. With regard to seating accommodation, there is a noticeable return to cross seats. With this design the car can be filled and emptied much quicker than with the open car unless an "expensive staff of hustlers" travels on the train.

The Great Falls Power Co., of Montana, has obtained the right-of-way for a transmission line 150 miles long for a period of 50 years, subject to a supply being given to the Chicago, Milwaukee, & Puget Sound Railway. The mountainous main line between Harlowton Mount to Avery, Idaho, a distance of 440 miles, is to be electrified. The estimated time of conversion of the railway is about eighteen months, and work should start within the same time. Between 50 and 100 locomotives will be required. According to the American electrical journals, a contract has been signed with the Montana Power Co., which controls the Montana Power Transmission Co., the Madison River Power Co., and the Thompson Falls Power Co. Energy at 110,000 and 60,000 volts will be fed to the railway company at eight different points, the minimum requirement for power being 25,000 kw., and the maximum for the present 50,000 kw. It is said that, though nothing definite has been decided, probably 2,400-volt D.C. traction motors will be used, supplied from trolley lines. The generating stations will be located at Great Falls on the Missouri River; three will be near Helena, one on the Madison River in the Rocky Mountains, and another at Thompson Falls in Clark's Fork.

According to the *Elektrotechnische Zeitschrift*, an order has been placed with the Ganz Electricitäts A.-G., of Budapest, for the complete electrical equipment of the Italian 18-mile railway between Angera and Varese on Lake Maggiore. The equipment is to be for direct current at 850 volts, and ten motor-coaches have been ordered.

Electric traction has been commenced on the Bevers, Zuoz, Schuls section of the Rhaetian railways, the well-known narrow-gauge system in the Engadine. The whole system is being equipped for electric working on the single-phase system at 10,000 volts, 16 $\frac{2}{3}$  cycles, power being supplied to motor-generator sub-stations from a large water-power station at 25,000 volts, 50 cycles three phase.

At the Committee of the Reichstag dealing with the proposed electrification of the Berlin Ring u. Stadtbahn, according to the *Elektrotechnische Zeitschrift*, the opinion was expressed by the Chairman that the cost of the additional steam rolling stock required to improve the service has been estimated too high, and the cost of the corresponding electrical installation too low. The cost of the necessary alterations to the telegraph and telephone systems if the single-phase system were employed would, he said, be nearer one million pounds sterling than the £250,000 allowed for this purpose. The representative of the State Railways affirmed, however, that the steam locomotives proposed by the Chairman would not enable the required service of trains to be reached.

A Select Committee has been appointed to inquire into certain aspects of Mr. C. H. Merz's scheme for the conversion of the Melbourne Suburban Railway system to electric traction. Among the matters to be investigated are the reasons for the substitution of the overhead direct-current system for the third-rail system.

According to the *Board of Trade Journal*, the Victorian Legislative Assembly has approved of the electrification of the Melbourne suburban railways being proceeded with on the understanding that no tender for the supply of electrical energy for traction purposes shall be invited or accepted without the sanction of Parliament. H.M. Trade Commissioner for Australia states that the initial work of conversion will probably be started at an early date.

Matters in relation to the tramway position in Oxford are evidently to be brought to a head because the Corporation have passed a resolution instructing the Tramways Committee to apply to the National Electric Construction Co. for the penalties due in consequence of the failure to convert the tramway system to electrical working within the period specified by the Acts of Parliament. As we pointed out recently, the company are considering the possibility of using petrol-electric tramcars.

Good progress is being made with the trolley omnibus scheme in Brighton, and representatives of the Brighton and Hove Corporations are meeting to decide upon the overhead equipment for the through routes.

The Tottenham Council have agreed to the proposal of the Metropolitan Electric Tramways Co. to seek Parliamentary powers to run trolley omnibuses from Wood Green to link up with the Walthamstow tramway system.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

For over a week Mr. W. R. Lawson has been cross-examined by members of the House of Commons Committee which is inquiring into the Imperial wireless telegraph scheme, and the nett result of it is that he has practically withdrawn all charges of corruption against Cabinet Ministers in connection with the proposed contract. The Committee are now considering a second interim report. The most important item of interest since Mr. Lawson's evidence is the receipt of a letter from the Marconi Company stating that unless the contract is definitely confirmed by March 1st, they have been advised by Sir Robert Finlay that they are within their legal rights in regarding the contract at an end, and that they would, in fact, do so. This letter is in answer to a reply by the Postmaster-General to a previous communication by the company refusing a request to treat the contract as at an end.

We are informed that the meeting of the Advisory Committee on Wireless Telegraphy will be held in private, and will not be open to the press.

The Postmaster-General has entered an appeal against that portion of the award in the Telephone Arbitration which deals

ELECTRICAL CONTROL GEAR FOR PRINTING MACHINERY

ADAMS  
MFG CO LTD  
BEDFORD  
AND  
LONDON

with the raising of capital. By a majority of two to one (Sir James Woodhouse disagreeing with the principle adopted) the Commissioners allowed £247,189 for the cost of raising capital, in respect of which the company claimed £757,657.

The results of some tests on transmission efficiencies of an umbrella-type antenna and "counterpoise" at Fort Leavenworth, Kansas, by the U.S. Signal Corps are given in the *Electrical World* (New York). The antenna was of the four-wire type, supported by a pole 40 ft. high; each wire was 85 ft. long, and connected by three insulators in series with a guy rope 150 ft. long. The bottom of the antenna was about 18 ft. from the ground. The counterpoise consisted of four wires, each 100 ft. long, rubber-insulated, laid upon the ground, outer ends insulated and inner ends connected to the transmitter. Normally this counterpoise is spread out so that each wire is directly under one of the antenna wires. This is not really a counterpoise, but a capacity earth. By rotating the counterpoise through  $45^\circ$  a 17 per cent. gain in efficiency was recorded. This is difficult to explain. Increases in efficiency to the value of about 15 per cent. were noted when an eight-wire antenna of the same natural period was substituted; the wires were 65 ft. long on a 40-ft. pole, the height of the lower ends of the antenna being 29 ft. above the ground. The regular four-wire antenna and counterpoise, with ends of antenna raised to 40 ft. above the earth, making a four-wire umbrella "flat-top" aerial, gave an increase of about 40 per cent. The experiment repeated with the outer ends of the antenna lowered to within 3 ft. of the ground gave a loss in efficiency of 6 per cent. This result is not in agreement with earlier work carried out on much higher antennae, but probably the same laws of radiation efficiency do not hold when wires are close to the earth as when they are raised well above it. It is probable that even with the outer ends of the antenna wires in their normal position, 18 ft. above the ground, they are too low for good results.

In an article in the *Elektrotechnische Zeitschrift* of January 23rd, Mons. E. Leimer, of Nancy, describes some interesting experiments in wireless reception. In the immediate neighbourhood of a large transmitting station he says it is possible to receive and read signals by laying out the connecting leads of a high-resistance receiving apparatus on the window-sill. Signals had been read up to a distance of 30 miles from the Eiffel Tower station with an antenna consisting of a wire netting of half a square metre stretched over the window-frame. In dry weather messages had been received up to 60 miles, using a roof drain-pipe or badly-earthed lightning conductor. For the same distance successful results were obtained with the gas-pipes of a house for the antenna, and the water-pipes of the same house as an earth, even when the resistance between the two was as low as 5 ohms. Within a range of 180 miles an antenna consisting of two wires 55 ft. long strung along the roof 24 in. apart, and only 4 in. from the tiles, was sufficient. It is not necessary for the roof to be a high one. Good results were obtained for the same range with two 80-ft. lengths of wire strung parallel to, and only 3 ft. above, the ground in an enclosed yard. The lightning conductor of a 55-ft. chimney made an excellent antenna when disconnected from earth, and it was noticed that when much black smoke was emitted the signals were much better, showing that the smoke had the effect of lengthening the conductor. If a wire is strung for a distance of some 150 to 300 ft. parallel to, and about 3 ft. from, an overhead lighting circuit, this makes an excellent antenna, enabling signals to be received at a distance of several hundred miles. Good results were also obtained by connecting the antenna lead of the receiving apparatus direct with a working overhead A.C. lighting circuit, the connection being made through a condenser of suitable capacity to avoid earthing the circuit. Overhead telephone lines can also be used for the purpose. With direct connection to a double circuit line, 300 yards long, it was found possible to receive signals from a distance of 1,200 miles. Finally, Mons. Leimer states that he has succeeded in receiving messages from Clifden at a distance of 770 miles by connecting his receiving apparatus direct to

an ordinary double circuit overhead telephone line, and, moreover, by connecting the receiver telephone circuit again to the telephone line he has enabled a subscriber 170 miles distant to hear the signals also, the same telephone circuit being thus used as antenna and as transmitting circuit.

It is stated that in Tuckerton, New Jersey, a large wireless station on the Telefunken system is being installed. The tower will be 820 ft. high, and will be second in height only to the Eiffel Tower. It is proposed to establish direct communication with Europe and German West Africa from these stations.

It is announced that the six U.S. naval wireless telegraph stations in Alaska are to be opened for commercial purposes.

It is stated that the New Zealand Government have decided to install automatic telephones in Wellington and Auckland, and that 1,000 instruments have been ordered from America for this purpose.

The February number of the *Marconigraph* opens with a concise report on the findings of the International Conference with regard to the transmission of radiotelegraphic time signals. Following is a varied series of articles, amongst which is one by Mrs. Eva Jordan on "Travel in the Congo." Another deals with the effect of volcanic eruptions on wireless telegraphy; and a third tells the history of wireless telegraphy in Brazil. Capt. Beuttler contributes a humorous sketch, while the monthly biography is of His Excellency Don Jose de Bascaran y Federic. Lastly, there is an illustrated review on "Heroes of Science," and a considerable amount of miscellaneous information as to the progress of the Marconi system throughout the world.

A 5-kw. wireless telegraph station is to be erected at Hong Kong. It is hoped that if the Imperial Government erect a high-power station at Hong Kong in connection with the Imperial wireless scheme, it will be available for long-distance commercial work.

According to *The Times* Sydney correspondent, wireless stations are now operating in the six State capitals, also on Thursday Island and at Port Moresby. The Mount Gambier station will be open next week, and the Townsville, Cooktown, and Rockhampton stations next month. Before the end of June the Port Darwin, Wyndham, Broome, Roebourne, Geraldton, and Esserance stations are all expected to be working, thus completely encircling the continent.

For some time it has been decided to lay an underground telephone cable with Pupin coils between Zurich and Basle. Owing to the decision that the cable, which will cost some 600,000 francs, was to be made by a Swiss firm, there has been some delay, but the work will shortly be taken in hand.

The Dartmouth-Guernsey cable was down on the 29th January and telegrams had to be sent *via* France until 6th February, when repair was effected.—The Ottoman Government prohibited the use of secret language in telegrams for places in Turkey in Europe and Asia, excepting the provinces of Hedjaz, Yemen and Bassorah. Diplomatic official messages are, however, accepted.—The lines of the Indo-European Telegraph Company between Kertch and Soukhoun-Kale, and the cable between St. Jacques and Doson were down on the 5th inst.—The cables between Lattaquie-Palura, Scalamuova-Samos, Marmaritzia-Rhodes, Besika-Tenedos, Tokio-Guam, and Otranto-Vallona still await repair.—The Bissao-Bolama cable was restored on the 8th inst., and the lines between Teheran and Meshed became deranged.

**Expiration of American and Foreign Patents.**—In a recent decision, the U.S. Supreme Court held that American patents on inventions patented in foreign countries expire with the expiration of the foreign patent, notwithstanding claims that the treaty of Brussels of 1900 provides otherwise.

**Electricity and Fire Risk.**—Our attention is called by an article in "Installation News," published by Simplex Conduits, Ltd., to the following remark which appeared in the *Post Magazine and Insurance Monitor*: "Cheaper current and cheaper lamps are still further replacing gas, and on the whole the change is materially improving the Fire Risk."

# "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

## Specifications Published Feb. 6, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

819/12. **Storage Battery Plates.** J. T. NIBLETT. To improve the contact between the conductors and active material in batteries of the solid type, i.e., those in which porous masses of active material are used instead of grids supporting active material, the electrodes are made grid-like, and their pocketed fuses are pasted with active material. Before this has set, loose active material is packed between the electrodes and the porous pot of the cell. Two figures.

991/12. **Lighting Incandescent Vapour Lamps.** F. BOTSSON and J. GUESNIER. Two positive electrodes are used. In the circuit of one is an inductance, and of the other a resistance, connected through a two-way switch. At starting, the inductive circuit is used, whereby a series of hot sparks is produced which forms the vapours required. Three figures.

1.166/12. **Incandescent Lamp Holders.** A. R. MÜLLER. The holder is made entirely of insulating material, and is in two parts. The lower part is in the shape of a double cup, while the upper part forms a closure for the uppermost cup. In the partition which divides the lower part are two holes for the lugs of the porcelain fitting. A shade is held against a flange by a spring. One figure.

1.280/12. **Control Switch for Step-by-step Signalling Motors.** VICARS and H. J. CREFFIELD. Non-inductive resistances are connected between pairs of contact fingers, so that they are included in the circuit of one pair of field magnets when more than one pair are being energised at a time. By this means the armature movements are well defined, and sparking at the brushes and excessive currents reduced. Four figures.

1.681/12. **Automobile Lighting.** B. T. H. and E. GARTON. A vibrating contact is controlled by an electromagnet with two windings, one across the generator armature, and the other across the field. An automatic cut-out controls the connections between the generator and a storage battery. To limit the charging current there is a series resistance, which is automatically short-circuited when the battery is supplying the lighting. There is a similar resistance in series with the lamps, which is cut out when they are supplied from the battery alone. One figure.

1.979/12. **Speed Control of Cascade Induction Motors.** E. ROSENBERG. The rotor of the first motor is connected to a starting resistance through the stator of the second motor, which has a short-circuiting switch whereby the resistance can be connected direct to the rotor of the first motor. Mechanically connected to the short-circuiting switch is a pole-changing switch. The resistance is always connected to the rotor of the first motor. Two figures.

3.906/12. **Renewable Incandescent Lamps.** E. M. BAILEY and W. PLEWS. A moulded glass bulb with funnel-shaped neck and a conical rubber stopper containing the leading-in wires and exhaust tube are vulcanised intact. An hermetically sealed joint is maintained by the vacuum, the atmospheric pressure keeping the stopper in position. By opening the exhausting tube, the stopper may be removed intact. One figure.

7.602/12. **Combined Cigar-lighter and Advertisements.** F. WEBER. An electric cigar-lighter is connected to a case containing illuminated advertisements. A motor-driven switch is also provided. Its function is to cause the advertisements to be successively illuminated once every time the lighter is used. Three figures.

9.983/12. **Incandescent Lamps.** W. J. LUSTED. The stem is provided with an extension, at the end of which is a reflector. Filaments are arranged across the reflector and along the stem extension. Six figures.

10.501/12. **Wireless: Calling-up.** W. S. PEAKE. To call up all stations within range, each station is provided with a vibrating reed, mechanically tuned to the same frequency as that of the received impulses. It must have a considerable moment of inertia and small damping coefficient, so that comparatively many impulses are required to set it vibrating sufficiently. The sending apparatus is of the Morse key type driven uniformly. Nine figures.

16.042/12. **Induction Boilers.** J. BALLY. The tube system in which the liquid is heated forms the short-circuited armature of an alternator having a movable inductor. The tubes are arranged in a circle round a central space in which the inductor rotates. The tubes may be in slots in a magnetic frame, which may be utilised as a feed water heater. Six figures.

22.251/12. **Automatic Circuit-breakers.** J. H. DE THIERRY. A momentary overload causes the breaker alternately to break and make circuit as long as the overload lasts, but after a certain time-limit the circuit is permanently broken. The actuating mechanism is held in the make position by a pawl

actuated by a relay, and in the break position by a lever worked by a pin from a clockwork, spring-controlled toothed wheel, which advances by one tooth with every make and break. To adjust the time-limit, the wheel has as many holes as it has teeth, and into one is inserted a pin. A weighted piston is raised by oil pressure, produced by a pump worked by the wheel. When rotation has ceased the piston descends, discharging the oil through a hole, whereby the lever holding the toothed wheel against rotation is released, and the wheel returns to its normal position. Five figures.

24.135/12. **Railway Signalling.** J. W. PAGE. A signal system is described whereby "the driver of a train may at all times keep the road ahead of him clear by causing signals to be displayed in advance, denoting that his train is approaching a certain block." Signals are worked by electric motors supplied from batteries, but are put into operation by a striking gear at the side of the track, worked by the train. Five figures.

## Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad. Summaries of some of the more important of these patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** B.T.H. and GARTON [Automobile lighting] 2,874/12; VON DREGER [Charging accumulators] 5,434/12; GEB. SIEMENS [Fireproofing moulded conductors] 16,044/12.

**Dynamos, Motors, and Transformers:** LEITNER [Brush gear] 28,817/11; SIDDELEY, 1,999/12.

**Electrometallurgy and Electrochemistry:** NIBLETT [Electrolysis] 1,671/12; MARINO [Treating aluminium for metallic deposition] 2,136/12; PAULIN [Electrolysis] 6,261/12; RENNERFELT [Furnaces] 7,367/12; MURRAY [Electrotype] 8,746/12.

**Heating:** MANX [Fluid heater] 26,485/11.

**Incandescent Lamps:** DEUTSCHE GASGLÜHLICHT, 2,284/12.

**Instruments and Meters:** RECORD [Moving coil type] 26,241/12 and 26,242/12.

**Switchgear, Fuses, and Fittings:** MOLLETT [Shade supports] 28,462/11; DRUSEIDT [Switches] 28,942/11; SELBY and PRESTON [Switch and fuse boards] 1,646/11; B.T.H. and GARTON [Switches] 1,680/12; LEITNER [Circuit control] 1,965/12; MUNRO [Spring shade holder] 2,020/12; BERRY and MARKHAM [Fused switches] 3,338/12; CLIFFORD [Automatic switches] 3,915/12; COX [Switches] 5,280/12; LEVI and ROSE [Portable reading lamp] 9,442/12; BOYD and TANNAHILL [Fuse] 12,273/12; SIEMENS-SCHUCKERT [Mercury motor-starting switches] 14,087/12; SCHOTT and GEN [Automatic switches] 25,518/12.

**Telegraphy:** STILLE [Telegraphic photography] 12,709/12.

**Traction:** BLACKALL and JACOBS [Tablet single-track working] 1,852/12; PIERER [Petrol-electric] 3,281/12.

**Miscellaneous:** STEWART [Ozonising, ventilating, &c.] 1,931/12; BRITISH EVER-READY ELECTRIC CO. (Heil) [Depolarizers] 25,784/12.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Ignition:** BOSCH [Short-circuiting gear] 27,403/12.

**Telephony:** TELEPHON APPARAT FABRIK ZWIETUSCH [Automatic selector switch] 16,151/12

## Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

**Distribution Systems, Cables and Wires, Insulating Materials, &c.:** E. MÜLLER [Plastic insulating material] 23,095/07.

**Electrochemistry and Electrometallurgy:** S. O. COWPER-COLES [Purifying electrolyte in centrifugal container by arc lights] 23,145/07; [Making small copper tubes] 23,235/07.

**Instruments and Meters:** HARTMANN & BRAUN [Magnetometer for resonance, instruments, tuned reeds, &c.] 23,318/07.

**Switchgear, Fuses, and Fittings:** VERITY's and F. W. THORPE [Tilting incandescent lamp fitting without balance weights] 21,202/05; B.T.H. (G.E.Co., U.S.A) [Toggle joint circuit breakers] 23,449/07.

**Telephony and Telegraphy:** I. KITSEE [Moving-coil relays] 23,386/07.

**Traction:** J. S. RAWORTH [Regenerative control: construction details and car interlocking gear. Series turns on motor magnets] 22,551/05.

**Miscellaneous:** E. & O. A. Co. [Adjustable fans: Motor in spherical pivoted case] 22,701/04; J. C. BEST [Locks of miners' safety lamps] 23,086/07.

## LOCAL NOTES

**Aberdeen: City Electrical Engineer's Libel Action.**—The libel action in which Mr. J. A. Bell, the City Electrical Engineer, is claiming £1,000 damages for slander against Mr. A. E. Milne, Hon. Secretary of the Aberdeen Branch of the Electrical Contractors' Association, has arisen through Mr. Bell's advice upon an estimate by a local firm for an electric lighting and heating installation. From the papers in the case it seems that the estimate was for 23s. 1d. per point, and Mr. Bell, in the capacity of consulting engineer, expressed the opinion that this charge was excessive. Following on this, a letter was sent by the Hon. Secretary of the Aberdeen Branch of the Electrical Contractors' Association to the Aberdeen Town Clerk, commenting on this matter, and couched in language which Mr. Bell maintains is a reflection upon his ability, and implies ignorance, incompetence and want of professional skill on his part. Further, he claims that the letter was intended to damage him in the eyes of the Aberdeen Town Council, and that in fact he has been greatly injured in his professional reputation by the statements made, of which, by the way, a withdrawal of and apology for is refused. For the defendant it is claimed that the statements were privileged and that the letter in question was written under the instruction of the Association. Further, it is contended that, looking to the character of the work, the statements made by Mr. Bell were untrue. The case is expected to come on very shortly.

**Belfast: Power Supply.**—Arrangements have been made to supply the Irish Flax Spinning Co. with power for their Bath Place mill on a basis of 30s. per annum per kw. of maximum demand, plus 0.5 per unit for a minimum of 317.196 units per annum.

**Threatened Strike of Electrical Workers.**—A demand is being made by the electrical wiremen for an increase of from 84d. to 9d. per hour, and a strike has been threatened if this demand is not met. It seems that the membership of the local branch of the electrical wiremen's association is about 230, most of whom are employed by Messrs. Harland and Wolff. This firm has paid a minimum wage of 9d. per hour, and have promised a further advance in March. It seems, therefore, that the effect of the threatened strike will be very circumscribed.

**Derby: New Plant.**—At the last meeting of the Corporation it was decided to apply to the Local Government Board for sanction to a loan of £13,500 for the 2,000-kw. turbo-alternator set advertised in our last issue. The addition of this set will bring the generating plant of the Corporation up to 7,750 kw., but it is proposed to scrap two small engines, which will reduce the total to 7,450 kw. The chief criticism on the proposal came from a shareholder in the local Gas Company, who expressed the opinion that the scheme proposed is only half a scheme and that it would be far better to remove the Corporation's new power station to a more favourable site, where it would be possible to produce more economically than at present. He himself, he said, was producing electrical energy cheaper than the Corporation.

**Dundee: Carolina Port Extensions.**—Excavations on the site for extensions at the main generating station at Carolina Port are now well in hand, and pile-driving is to be started immediately.

**Electric Driving.**—Messrs. Mather & Platt are fitting a factory in the centre of the City with three-phase motors. Another factory which has recently been connected to the Corporation mains in the Lochee district has been fitted with the Schorch system of individual drive.

**Handsworth (Birmingham): Lapse of Electric Supply Powers.**—The Board of Trade have issued an order depriving the Shropshire, Worcestershire & Staffordshire Electric Power Co. of their rights to supply electricity in Handsworth, Yardley, and a portion of King's Norton and Northfield, all of which are now included in the city of Birmingham. The company has never given a supply in these districts, and the Board of Trade's certificate is issued under the "Cesser of Powers" Clause in the Company's Acts.

**Hove: Purchase of Electric Supply Co.**—The poll of rate-payers to decide as to the promotion of the Bill providing for the acquisition of the Hove Electric Lighting Company's undertaking, has resulted in a majority of 369 in favour, the figures being 1,380 in favour and 1,015 against.

**Leicester: Interruption to Supply.**—The interruption to the supply on Wednesday last week has been explained by the Borough Electrical Engineer, who states that a short circuit occurred at the back of the main switchboard at the Aylestone

Generating Station. This switch controls the whole of the lighting supply of the town, and the fire that ensued could only be coped with by shutting down the whole supply. Temporary wires were then installed and in ten minutes the full supply was restored.

**Rushden: Electrical Power Station.**—The Corporation have passed the plans for the generating station of the Rushden and District Electric Supply Co., which recently obtained an electric lighting provisional order.

**Scarborough: Proposed Purchase of Electric Lighting Co.**—The Town Clerk, Borough Engineer and Borough Accountant have been instructed to report upon the proposed purchase of the Scarborough Electric Lighting Company.

**Walsall: Position of Electricity Undertaking.**—The General Purposes Committee recommends that a consulting electrical engineer be engaged to report upon the general position of the electricity undertaking, and to advise as to the course to be adopted to ensure its profitable working in the future.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

[Notes of Contracts Open are not repeated under this heading week by week until the last date for receiving tenders, as is done in some of our contemporaries, but are only inserted once.]

## Generating Stations, Sub-Stations, Mains, &amp;c.

**Glasgow.**—Plant for one of the pumping stations for the new Dalmarnock Electricity Works is required at an estimated cost of £3,000.

**London: L.C.C.**—Two 8,000-kw. turbo-alternators with condensers, &c.; three 1,500-kw. rotary converters; nine transformers for same with two starting transformers. Feb. 25th. (See advertisement on another page.)

**Battersea.**—Additional boiler and mechanical stoker, &c., is required, at estimated cost of £3,275.

Mains extensions at an estimated cost of £200 are to be put in hand.

**Shoreditch.**—Two Green type economisers. Borough Electrical Engineer. (See advertisement on another page.)

**Stepney.**—Turbo-alternators, boilers, &c. Borough Electrical Engineer, March 17th. (See an advertisement on another page.)

**Maidstone.**—A new generating set at an estimated cost of £5,620 is to be installed at the generating station.

**Oldham.**—Two 500-kw. motor alternators. Borough Electrical Engineer, February 21st. (See an advertisement on another page.)

**Peterborough.**—A loan of £1,000 for mains extensions has been sanctioned.

**Tunbridge Wells.**—The Corporation have referred the report of their Borough Electrical Engineer, with respect to the replacement of the small sets used on the light load, to its Consulting Engineers, Messrs. Boot & Partners, 7 Victoria Street, Westminster, for report.

## Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

**Gloucest.**—Estimates are being secured for the lighting of the workhouse.

**Durham.**—Training college for women. County Architect, Shire Hall.

**Egham.**—New drill hall for Surrey Territorial Force Association. Secretary, Caxton House, S.W.

**Lincoln.**—Extensions to County Asylum.

**London: L.C.C.**—Leipsic Road School, Camberwell, 210 points. Feb. 25th. (See advertisement on another page.)

**Westminster.**—Theatre, near Charing Cross. Architects, Richardson & Gill.

**Manchester.**—Electric light and fittings for George Leigh Street municipal school, Ancoats. Education Offices, Deansgate.

FOR  
STEAM JOINTS  
USE

JOHN HUDSON & CO.'S SUCCESSORS, Mansell St., London, E.

**Motherwell.**—Cinematograph theatre, Brandon Street.  
**Oldham.**—New mill for Belgrave Mills Company. Architects, F. W. Dixon & Son.  
**Preston.**—New baths.  
**Torquay.**—New municipal buildings.

#### Miscellaneous

**Blackburn.**—Twelve months' supply of insulated material, fuse boxes, motors, motor starting switches, &c., for Electricity Department. Borough Electrical Engineer. February 15th.

**Canada.**—A supply of electric motors is required for the equipment of the machine shops of the National Transcontinental Railway, Manitoba. Copies of the specification may be seen at 73 Basinghall Street, E.C.

**Douglas (I.O.M.).**—At a special meeting of the Town Council last week, Messrs. Handcock & Dykes were instructed to furnish full particulars of an electric lighting scheme estimated to cost £12,000.

**Hereford.**—Electricity is to be substituted for steam for the pumps at the waterworks. A loan of £1,000 is required for the work.

**Ilford.**—Twelve months' supply of arc lamp carbons, cables, house service fuse boxes, incandescent lamps, joint boxes, and meters. A. H. Shaw, Borough Electrical Engineer. February 25th.

**London: L.C.C.**—Tenders are to be invited for 2,200 track insulators and 3,200 porcelain for the tramway system.

**Rochdale.**—An additional loan of £80,000 for electrical extensions is to be applied for.

**Stockton-on-Tees.**—Twelve months' supply of stores for Electricity Department. Electrical Engineer. February 19th. (See advertisement on another page.)

### TENDERS RECEIVED AND ACCEPTED

**Belfast.**—The Harbour Board has placed an order with Messrs. G. Russell & Co., of Motherwell, for a 120-ton electric derrick crane at £8,725.

**London: L.C.C.**—Orders have been placed with the British Insulated & Helsby Cables, Ltd., and Messrs. Brecknell, Munro & Rogers, for fittings for the overhead tramways system.

The following tenders have been received for number plates on the trams:—Venner Signs, Ltd., £3,805; Brush Electrical Engineering Co., £6,070; Hurst, Nelson & Co., £7,486. The first-named tender is recommended for acceptance.

**Manchester.**—The following tenders have been accepted by the Corporation:—Testing battery at Ardwick cable stores, Tudor Accumulator Co.; transformers, British Electric Transformer Co.; fuse boxes, British Insulated & Helsby Cables, Ltd.; and paper insulated cable, Siemens Bros. & Company.

**Newcastle-on-Tyne.**—Messrs. Ferranti, Ltd., have received a contract for the supply of tramcar meters.

**Newcastle-under-Lyne.**—An order for cable has been placed with Callender's Cable & Construction Company.

**Salford.**—An order for two-circuit breakers at £90 has been placed with Mr. Bertram Thomas.

### APPOINTMENTS AND PERSONAL NOTES

The Sheffield Tramways Committee recommend an increase in the salary of Mr. A. R. Fearnley, the tramways manager, from £800 to £900 per annum, with further annual increments of £25 to £1,000 per annum.

The salary of Mr. T. Hall, Borough Electrical and Tramways Engineer at Burton-on-Trent, is recommended for an increase from £225 to £275 per annum, and that of Mr. C. J. Melbourne, Chief Engineer at the Electricity Works, from £145 to £160 per annum.

Mr. Bernard L. Myer has resigned his position as Chief Electrical Assistant with Messrs. Sloan & Lloyd-Barnes, consulting electrical engineers (Liverpool), and has taken over the management of the electrical and engineering department of Messrs. Fred. Wilkins & Brother, Ltd., 27-35 Duke Street, Liverpool.

An engineer for line work is required by the Constantinople Telephone Co. (See an advertisement on another page.)

The salary of Mr. J. W. Dugdale, General Manager of the Oldham Tramways, has been increased from £350 to £400 per annum.

Messrs. W. H. Tritton and D. Ritson, shift engineers at the Gillingham Electricity Works, have resigned. Mr. F. Tutt, of Gravesend, succeeds Mr. Tritton, and Mr. F. Knell, of Sheerness, succeeds Mr. Ritson.

Mr. J. M. Keenan, Chief Assistant Electrical Engineer at Torquay, is to have his salary increased from £166 to £180 per annum.

Mr. S. Williams has been appointed Borough Electrical Engineer at Wishaw.

### MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. George Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars c.i.f. port of arrival, quoted on Tuesday night, was £74 to £76 (last week, £74 10s. to £75 10s.).

**Lantern Slides.**—Siemens Brothers Dynamo Works, Ltd. (Caxton House, Westminster), have extended and revised their list of lantern slides which are kept at Caxton House, and lent free of charge to lecturers, schools, &c., and now comprises 238 different slides of electrical interest.

**The G.E.C. Football Teams.**—The still undefeated team from the Witton works was victorious last Saturday against the London office staff by 5 goals to 3. In the evening a most successful dinner and entertainment was held, at which some seventy were present.

**Plant for Sale.**—The whole of the plant at the Dunning Street generating station of the Sunderland Corporation is to be sold. (See an advertisement on another page.)

**Social Gathering.**—Messrs. Rawlings Brothers, Ltd. (82 Gloucester Road, South Kensington, S.W.), entertained some 400 of their employees, with their wives and friends, on Saturday last at their annual social gathering, when an excellent musical programme was performed.

**Dinner.**—The employees of the Record Electrical Co. (Broadheath, Manchester) held their first annual dinner at the Brooklands Hotel, Cheshire, last Saturday. Mr. C. W. von Roemer, chairman of the company, presided. After some speeches in happy vein, the proceedings terminated with a concert.

### COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**Yorkshire Electric Power Co.**—The net profit last year was £7,361, against £7,784 and £6,503, respectively, in the two previous years. The accumulated profits to the end of 1911 have permitted the writing off of £14,047 administration and development expenses, and the payment of the dividend due on the cumulative preference shares, leaving £330 to be carried forward, in addition to the 1912 profits. Out of the available balance of £7,691, a 6 per cent. preference dividend for the half-year to December 31st is to be paid, and after writing off special expenditure during 1911 upon generating plant (£1,920), the sum of £644 is carried forward. During 1912 considerable expense has been incurred upon the generating plant and distribution system in order to cope with the increasing demand. The Yorkshire Waste Heat Co. is erecting a station at Barugh, near Barnsley.

**Dividends of London Electric Supply Companies.**—Announcements of dividends by the London electric supply companies for 1912 are now being made. The Westminster Electric Supply Corporation and St. James's & Pall Mall Electric Light Co. announce final dividends, making 10 per cent. for the year, and the London Electric Supply Corporation 5½ per cent.

**W. T. Henley's Telegraph Works.**—A dividend at the rate of 15 per cent. per annum for 1912 is recommended.

**Chloride Electrical Storage Co.**—The directors propose to pay a bonus dividend of 7s. 6d. per share on the ordinary shares for last year by the issue of the 19,344 unissued ordinary shares. If the bonus is not met by the above issue, the remainder will be paid in cash.

**Liquidations.**—A meeting of creditors of the Provincial Electric Co. was held at 125 Edmund Street, Birmingham, on Tuesday.

### John E. Raworth,

Queen Anne's Chambers, Chartered Patent Agent.  
 30, Broadway, Westminster, London, S.W.

## SUMMARY

THE co-operation of all sections of the electrical industry to form an Association for the purpose of advertising electricity was advocated in a Paper read by Mr. H. C. Palmer before the Manchester Section of the Institution of Electrical Engineers. Mr. Palmer had worked out his scheme in considerable detail, and the Paper was followed by a critical discussion, in the course of which a diversity of views were expressed. (Page 99.)

WE publish some more particulars of the position of affairs at Salford which made it necessary to make arrangements for obtaining a "bulk" supply. The boiler plant is fully loaded, there is no space for ex-

tensions, and the load next winter is expected to be beyond the capacity of the present station. Had the Council not known that they were favourably situated for bulk supply, a new station would doubtless have been put in hand a year or two ago. (Page 100.)

AN ingenious system of cutting meters out of action periodically during non-peak hours to give the effect of double tariff charging, by means of resonating relays actuated by a small high frequency voltage superposed on the mains, has been developed by Mr. W. Duddell, Mr. A. H. Dykes, and Mr. H. W. Handcock. (Page 101.)

THE results of an investigation into the best kinds of induction motors for different services were given in a Paper by F. C. Aldous read recently before the Manchester Local Section of the Institution of Electrical Engineers. The effects of onerous starting conditions on squirrel cage motors were discussed at length. The author recommends that all rotor joints be brazed or welded. (Page 101.)

A FORMULA by which the natural period of oscillation of alternators may be more accurately determined than by the short-circuit method, was given by Mr. A. R. Everest in a Paper read and discussed before the Institution of Electrical Engineers in London and Birmingham. (Page 103.)

THE lighting of a factory is described, and notes are given on a new oil switch and a house service fuse-box on page 104.

AN electric traction problem is mentioned in our Questions and Answers columns. (Page 105.)

THE grant of a patent to V. Stobie for a combined gas and electric arc steel refining furnace is opposed. A luminous radiator patent, by H. J. Dowsing, covering certain arrangements of reflectors to obtain a convector effect, expires on Monday next after a full life of 14 years. The Specifications published by the Patent Office last Thursday include one for telegraphic photography by C. Stille, and one for the arrangement of motors in electric locomotives above the wheel axles, which they drive by flexible gearing through a countershaft. This specification is in the name of P. Dawson and S. J. Lucas. (Page 106.)

THE Metropolitan Railway Co.'s shareholders have now sanctioned the purchase of the Great Northern & City Railway.—Considerable dissatisfaction is expressed with the position of the Lowestoft Corporation tramway system.—The proposed electrification of the Berlin Stadtbahn has been postponed pending further information with regard to a number of matters. (Page 107.)

THE Postmaster-General has again refused to release the Marconi Co. from the Imperial wireless telegraph contract.—Contracts have been placed for the erection of two pairs of Marconi wireless stations for Atlantic and two pairs for Pacific service.—The position of the Marconi Co. in Europe is also dealt with.—It is pos-

sible that the Hull Corporation will take over the old National plant there, and also be granted an extended license by the Post Office. (Page 107.)

THE Belfast Corporation have finally decided to erect a new power station.—The street electric lighting question in Westminster is again under consideration.—By a small majority the Cromer ratepayers have voted in favour of the disposal of the electricity undertaking. (Page 109.)

WATER-TUBE boilers are required at Dundee; small generating plant for the Toxteth workhouse.—Street lighting schemes are under consideration at Shipley and Swanage.—Electric lighting plants are contemplated at St. Luke's Hospital, Halifax.—Many authorities require twelve months' supplies of electrical stores. (Page 109.)

THE result of last year's working of a number of London electric supply companies are given. (Page 110.)

**Strike at Evershed and Vignoles' Works.**—On Wednesday last week between 200 and 250 men at the works of Messrs. Evershed and Vignoles, Ltd., came out on strike in consequence of a workman being discharged for neglecting his work. The men consider that he was harshly dealt with and demand his reinstatement—a demand which the Company, in view of all the circumstances, are not able to concede. The man is a member of the Scientific Instrument Makers' Union, but the hands were not called out by the Union, which, we understand, however, is now taking up the matter. The men are still "out," but the employees in the stores, packing department, and winding and lacquering rooms are working loyally for the Company. Every member of the staff throughout the works is doing his utmost to help the Company, and a considerable amount of work is thus being completed; including assistance given by members of the testing department and others, about 150 men are at work.

**A Street Lighting Specification.**—In March Mr. A. P. Trotter will read a Paper at a joint meeting of the Institution of Electrical Engineers, the Institution of Gas Engineers, the Illuminating Engineering Society, and the Municipal and County Engineers' Association on a standard specification for street lighting.

## ARRANGEMENTS FOR THE WEEK

FRIDAY, FEBRUARY 21st.

*Manchester Electro-Harmonic Society.*

7.30 p.m. Concert at Albion Hotel.

MONDAY, FEBRUARY 24th.

*Institution of Electrical Engineers: Newcastle Students' Section.*

7.30 p.m. At Armstrong College. "Notes on a Single phase Traction System," by V. O. Haddock.

TUESDAY, FEBRUARY 25th.

*Institution of Electrical Engineers: Manchester Section.*

7.30 p.m. At the University. "Some Recent Developments in Manchester Street Lighting," by S. L. Pearce and H. A. Ratcliffe.

*Electro-Harmonic Society.*

8 p.m. Concert (Ladies' Night) at Holborn Restaurant.

THURSDAY, FEBRUARY 27th.

*Tramways and Light Railways Association.*

7.30 for 7.45 p.m. Annual dinner and smoking concert, Trocadero.

*Institution of Electrical Engineers.*

8 p.m. Fourth Kelvin Lecture: "The Ohm, the Ampere, the Volt: a Memory of Fifty Years Before, 1862-1912," by Dr. R. T. Glazebrook.

## The London Electrical Engineers.

(To-day) THURSDAY, FEBRUARY 20th. C. Company.—Company Training, 7 to 10 p.m.

FRIDAY, FEBRUARY 21st. D. Company.—Company Training, 7 to 10 p.m.

SATURDAY, FEBRUARY 22nd. A. and B. Companies (Right Half Battn)—Week-end Training at Dover. Service Dress. Parade at Victoria Station, L.C. & S.E. Line, at 1 p.m. C. Company.—Week-end Lorry run. Parade at Headquarters at 2 p.m. Service Dress. Headquarters open for Regimental business from 10 a.m. till 12 noon.

MONDAY, FEBRUARY 24th. A. Company.—Recruit Training, 7 to 10 p.m.; Company Training, 7 to 10 p.m.

TUESDAY, FEBRUARY 25th. B. Company.—Company Training, 7 to 10 p.m.

THURSDAY, FEBRUARY 27th. C. Company.—Recruit Training, 7 to 10 p.m.; Company Training, 7 to 10 p.m.

**The British Westinghouse Club.**—The spacious new premises of the British Westinghouse Club in Manchester were ceremoniously opened on Saturday last by Mr. Lange (Managing Director of the British Westinghouse Electric & Manufacturing Co., Ltd.). The club is now open to all male employees of the company, and consists of a large hall capable of seating 300 persons, a dining-room, and a two-table billiard room, as well as many smaller rooms and a miniature rifle range. In the grounds there are five tennis courts and a bowling green. The club is financed by the company and the staff in equal proportions.

Mr. H. CLIFFORD PALMER ADVERTISES ELECTRICITY.

## ADVERTISING ELECTRICITY

AT the Manchester Section of the Institution of Electrical Engineers last week, Mr. H. Clifford Palmer (Manager of the Publicity Department of the General Electric Co.) read an interesting paper on "Advertising Electricity," illustrated with some fine designs for daily paper and poster advertising. He pointed out that, out of a population of forty-two millions in the British Isles, there were only a little over half a million consumers on the supply mains, and of these only a few thousands employed electric heaters, cookers, irons, kettles, &c. We had, he said, been too busy studying, experimenting, perfecting, and economising, to devote the necessary time and thought to advertising. He did not suggest that extensive action was justifiable or desirable five years ago but submitted that we had been somewhat apathetic during the last two or three years. He proposed that an "Electricity Publicity Association" should be formed, composed of selected members of the Electricity Supply Publicity Committee (representing the supply undertakings), the British Electrical and Allied Manufacturers' Association, and the Electrical Contractors' Association, and that the main duty of the new Association should be to direct the operations (under expert advice) and control the general policy of a national educative electrical advertising campaign. Sub-committees could be formed by each Association for the purpose of obtaining the necessary funds. If every one in our large industry contributed, the subscription need only be quite nominal, and but little difficulty would be experienced by the various finance committees in collecting subscriptions from those actually interested, whether members of an association or not. For a comprehensive scheme to cover the entire country, he would like to see not less than £30,000 raised for a twelve months' campaign, but he did not suggest that such an amount was absolutely essential, or that operations could not be started with less. As an example he outlined a scheme for London and the district within a radius of fifty miles of London, and calculated on the basis of a total expenditure of £12,000 for a twelve months' comprehensive advertising effort in the area mentioned. He would divide the expenditure as follows:

- (a) Daily Press advertisements, five-twelfths.
- Editorial notices in the daily and weekly Press would be covered by the Press advertising.
- (b) Literature and circularising (this to a considerable extent would be self-supporting), one-twelfth.
- (c) Central information bureau, one-twelfth.
- (d) Bill-posting, two-twelfths.
- (e) Expenses of management and staff, one-twelfth.
- (f) Illuminated animated signs for night advertising, two-twelfths.

He recommended that the Press advertising should be in the principal morning and evening papers, and divided into two periods—from the middle of March to the middle of June (cooking, ventilating, and other domestic applications, with power intermixed), and from the middle of September to the middle of December (lighting and heating, also with power intermixed). He also recommended that the insertions should appear not less than one per week in each paper; the size of the advertisement varying from time to time according to the total sum allocated to the paper in question. For the opening of the campaign and for any special occasion (such as the opening of the London Electrical Information Bureau referred to later) full pages should be taken in papers enjoying the greatest and most influential circulation. Editorial notices could come as a sub-heading to Press advertising, since to some extent the one carried the other. By this he did not desire to indicate that the money spent on advertising would positively buy the editorial columns of London's leading daily papers without further question; but no matter what might be said to the contrary, it would be bound to obtain greater recognition by the Press than was enjoyed to-day. Every week little paragraphs, which they would welcome, could be circulated to the editorial departments of various papers. He could foresee the day when the London and provincial papers would be willing enough to insert pages of popular electrical notes, in similar manner to the pages which now exist in most of the premier papers on motor notes, fashion notes, Empire news, cycling notes, &c. With such a scheme, properly organised on a co-operative basis, and with a qualified advertising man to act for the Association, he maintained that there should be no difficulty whatever in collecting news items of public interest from supply stations throughout the country, from manufacturers, and from con-

tractors, and dispersing them in proper manner to the Press. A considerable number of inquiries, Mr. Palmer continued, would be received by the Publicity Association from its members for the supply of suitable literature descriptive of the various applications of electricity, although, undoubtedly, there would be certain bodies who would prefer to handle this work independently and locally. Others might wish to be supplied with suitable illustrations, border blocks, inset sketches, colour blocks for covers, &c., and also to be advised as to lay-outs, types, paper, size, &c., for their own locally prepared booklets. All such advice and information should be available for the use of members of the Association. Circularising could be termed "intensive" advertising, and, as it was, of course, limited in its sphere of operations, it should be handled independently by the various supply undertakings, manufacturers, and contractors. All subscribers to the Publicity Association should be entitled to purchase the Association literature at special rates.

All the "extensive" advertising of the scheme would be conducted from headquarters in London, in which would be a Central Information Bureau to act in an advisory capacity as far as publicity was concerned for the benefit of all members of the Association, and *inter alia* to supply capable demonstrators for showroom work, &c. Little would be gained, however, in using this Bureau as a demonstrating showroom, as this work would be too restricted at one address and could be better administered from local showrooms in all districts. One of the most valuable functions of the Central Bureau would be the arrangement of cooking demonstrations, and lectures in connection therewith.

Local showrooms should be properly organised on co-operative lines. Where the contractors had already been sufficiently enterprising to establish good showrooms, station engineers should recommend the local public to make use of them as if they were actually established by the undertaking itself. In other directions the showrooms already established by the supply undertaking would be the more desirable. In the smaller towns, where practically nothing had been done so far, the station engineer and the contractor might be brought together under the auspices of the Central Bureau. Then, with the possible assistance of the manufacturers, an attractive showroom might be established. All such showrooms, Mr. Palmer contended, should be more or less uniform as far as style and lay-out are concerned. A standard style could be set up by the Association, and as far as possible all the recognised electrical showrooms should be brought into line. Sales should not be effected at these authorised showrooms, but inquiries should be referred to the contractor nearest to their particular residence or place of business who was a member of the Publicity Association. For outlying districts where local showrooms would not be justified, it might be possible to organise a small travelling exhibition to move from district to district, staying for four to six days in each.

As an example of the publicity that could be secured by bill-posting, the author referred to the Strand site in London, past which, it was estimated, over one million persons pass in a single day. In billposting, bold methods should be adopted, first in the size of the bill, secondly in the selection of colour scheme, thirdly in the design, and fourthly in the point made. As a general rule the less said on a poster the more effective the bill is likely to be. No attempt should be made to make more than one point. Provision should be made for a permanent display over two periods of three months each, of about 1,100 "16-sheet double crown" (10 ft. by 6 ft. 8 ins. upright) bills on selected billposting stations in the most prominent thoroughfares in London and Greater London. For the spring and summer campaign he suggested two bills, one advertising electric cooking and the other advertising ventilation by electricity. In the autumn campaign he recommended first an advertisement of electric lighting, subsequently replaced by one of electric heating.

Electric signs would serve to advertise the general cause, but would also be an excellent advertisement for electric signs. Again, as an investment, they would have an appreciating rather than a depreciating value; because, after a suitable "run" in the metropolis, the signs could be re-erected in prominent provincial centres, and so go on perpetually doing good.

In conclusion, Mr. Palmer again emphasised the strict necessity for the proper control of actual operations by an expert advertising man. The man selected should be, he said, an advertising expert first and an electrical man second.

## DISCUSSION.

Mr. W. E. WARRILOW (Advertisement Manager of the *Electrician*) said that the I.M.E.A. should be represented on the Association proposed. He deprecated the advertising of gas by comparison with electricity. He considered that the editorial puff was now too stale, and had lost its power with the public. He found that station engineers liked to have the printing of their pamphlets done locally; this acted as an incentive to the printer to become an electric power consumer.

Mr. A. G. SEAMAN (British Westinghouse Co.) said that the electrical industry was now ripe for bold, general advertising on the lines advocated. To be successful, the scheme must be co-operative and comprehensive. There were many points which would require the most careful attention before such a scheme could mature, and the most important was the raising of funds.

Mr. F. C. RAPHAEL (Editor of *Electrical Engineering*) thought the question was one of ways and means, since the principle was apparently universally approved. Getting started was the great difficulty. The advantage of such a scheme being as great to those who did not contribute to it as to those who did, left very little direct inducement to offer those who found the money. Perhaps Mr. Palmer's Paper was merely brought before the Institution as a *ballon d'essai*, and the newly-formed Industrial Committee of the Institution, which is partly composed of representatives of the very bodies which Mr. Palmer had mentioned, was the "Association" he actually had in mind. He favoured a large amount of daily Press advertising; in one of the informal discussions at the Institution (*ELECTRICAL ENGINEERING*, Vol. VIII., p. 219) he had suggested that electricity supply authorities should contribute an average of £50 each for this purpose annually, which would give a sum of £25,000 a year. The question had still to be decided, however, whether supply authorities had power to spend money in advertising for the general good, and were not confined to such operations in their own district. The only way to get useful "editorial puffs" in the daily papers was to have first-class popular lectures on electrical subjects delivered by first-class lecturers in the principal public halls. A charge for admission should be made. There should not be free lectures in public showrooms. In conclusion, he said that the electricity department showroom, as it is run at present, is a poor sort of makeshift, and contractors had no right to insist that the supply undertaker must not sell unless they themselves provided good and adequate showrooms, in which every article suitable for use in the consumers' installations could actually be bought.

Mr. B. WELBOURN (British Insulated and Helsby Cables) said that the publicity scheme suggested should be under the auspices of the Institution. Manchester, he thought, would be a better centre to work from than London. Uniformly designed showrooms would be a great mistake.

Mr. F. WALKER (British Westinghouse Co.) thought that the author's scheme was not nearly big enough. Many firms spent more than £30,000 annually in advertising. The poor attendance at the meeting showed that the value of advertising was not properly appreciated.

Mr. A. J. GREENLY (Marcus Heber Smith) thought a publicity committee not much good in the way of helping with the advertising work proper, such as the passing of copy, &c., and presumed it would confine itself to the raising and administering of the funds. Electric power should be advertised, he said, in the various trade papers, and not in the daily papers.

Mr. L. F. HOLMAN (Osborne, Peacock and Co.) emphasised the great need of getting the money first.

Mr. F. SELLS (General Electric Co.) agreed with the principle, and thought the scheme must be handled by an independent association; the Industrial Committee of the Institution had already enough to do. Regarding showrooms, it was a great mistake to warm up a customer and then to let him go before he could make his purchase, as was the case in municipal showrooms, where sales were not allowed. Corporations could, however, overcome this difficulty by throwing their showrooms open to manufacturers, charging them rent, and allowing them to sell their goods there; any profits over ordinary trade prices could be divided between the municipality and the contractors of the town.

Mr. S. RENTELL (Editor of *Electricity*) thought electricity should be able to do as well as gas in the way of publicity, and thought supply authorities should contribute in the same proportion as the gas undertakings did to their publicity scheme.

Mr. PALMER replied briefly, and was accorded a hearty vote of thanks. After the meeting much interest was taken in Mr. Palmer's advertisement designs, the originals of which he had brought with him.

## THE SALFORD ELECTRICITY UNDERTAKING AND "BULK" SUPPLY

IN our issue of last Thursday we were able to announce that the Salford Corporation, at their Council meeting on Wednesday, the previous day, had definitely decided to accept the offer of the Lancashire Electric Power Co. for the supply of electricity "in bulk," the load guaranteed to the

Company being a minimum of 1,000 kw. with possible increases to 3,000 kw. The resolution met with strong opposition by a small section on the Council, who maintained, not absolutely without reason, that the tenders of the Manchester Corporation and the Company were not based on the same estimate of the Salford Corporation's requirements. We believe, also, that the Manchester Corporation had suffered on a previous occasion on the question of standby, and therefore without definite guarantee felt bound to assume that the tender must be for 1,000 kw. supply and an actual standby of a further 2,000 kw., which might not be earning anything by sale of current. In addition, the mains required to bring the supply from Manchester to the Salford Electricity Works (which was the point at which they were asked to deliver) would have been much longer than those required by the Lancashire Power Co. to supply at the boundary of Swinton and Salford. It is to be noted in passing that the report of the Committee recommending the acceptance of the Company's tender did not contain any mention of the method of measuring the maximum demand.

The position at the Salford Electricity Works which led up to the inviting of tenders for supply "in bulk" was as follows. The present equipment of the station comprises eight 750-kw. three-crank vertical tandem compound Browett-Lindley-Mather & Platt sets, two Willans-Siemens 1,000-kw. turbo sets, and one Willans-Brown Boveri set of the same size. In order to increase the capacity of the 750-kw. sets, and also to render them more efficient in steam consumption, it was proposed to convert the engines to the "uniflow" system, and the work on one of the sets is in hand as a trial. It is anticipated that the capacity would be increased to 1,000 kw., and it appears that the generators are capable of giving this output. This would ultimately increase the capacity of the station to 11,000 kw., or, assuming two sets always in reserve, 9,000 kw. The boiler plant is, however, at present insufficient for this larger generator capacity, and there is not room for extensions of it. On the whole, therefore, owing to possible further delays in the alterations of the engines, largely due to exigencies of load which would prevent any considerable number of the 750-kw. sets being out of commission at the same time for the alteration, and also on account of the position with regard to the boiler plant, and further increases of load coming on shortly, either a new station or taking a "bulk" supply become an urgent necessity. In fact, the Council admit that, if a single engine broke down, the position would be serious, that it is impossible to find space for more boiler plant, and as they estimate that from two-and-a-half to three years would be required, in the most favourable circumstances, to erect a new station, arrangements for a bulk supply were absolutely necessary.

To convert the extra high-tension three-phase current to low-tension D.C., three rotary-converters with the necessary transformers and switchgear are to be obtained at once, and tenders are being invited now in advance of the sanction of the Local Government Board to the loan of the £12,000 necessary for these, to allow six months to obtain delivery.

**Batti Wallahs.**—There was an informal meeting on Wednesday last week. The date of the annual dinner has been postponed to March 15th, owing to the proximity of the original date to the annual general meeting, which takes place on March 3rd.

**Old Centralians Dinner.**—The Annual Dinner of the Old Centralians was held on Saturday. Sir John Wolfe Barry, K.C.B., who was in the Chair, said that the College was never more successful than at the present moment. Its inclusion in the Imperial Technical College added increased lustre, and the students of the City and Guilds Engineering College represent about half the total number of students of the I.T.C. Within a reasonable number of months the extension of the building would enable more students to be accommodated, and would give more room for research and post-graduate work. In the course of his speech, responding to the toast of the College, Prof. Dalby told an interesting story of a new student who only turned up a week after the commencement of the term; he had received a notice that the session would start on the 10th proximo, and had interpreted this to mean *about* the tenth of the next month. Dr. G. T. Moody, who proposed the Old Centralians, and who is the new President, deplored the closing of the Chemical Department at the College. Mr. W. Duddell, F.R.S., Past-President, in replying, said that he hoped that the new laboratories and greater space would not make it too easy for the students, as the student often learnt more by being compelled to make the best use he could of limited space and a limited supply of apparatus. The membership of the Old Centralians is now 1,019. The opportunity for meeting old friends was much appreciated, and the party did not break up until some time after the close of the speeches.

## THE CONTROL OF METERS, SWITCHES, &c., FROM THE CENTRAL STATION

LAST week, through the courtesy of Messrs. Handcock and Dykes, we were able to see on the mains of the Egham and Staines Electricity Co. an interesting system at work for the control of meters used in a two-rate system of charging, from the central station, using only a single meter without clock-switches. Briefly, the system is to cause the meter shunt-circuit to be broken for, say, five minutes out of every seven during the non-peak hours by means of a relay actuated from the supply station by means of a superposed high frequency alternating current all over the system. This gives the equivalent of charging at the desired lower rate during the day-time without the need for two meters. The relay used is cheaper than an equivalent clock-switch, and the energy used to work it is less than that saved by the periodical cutting out of the meter shunt coil. The system is already in regular operation on the mains at Staines, and appears to be giving satisfaction.

The principles on which the relays and other apparatus employed are based are set forth in an original communication by the inventors, Messrs. W. Duddell, A. W. Dykes, and H. W. Handcock, accepted for publication by the Institution of Electrical Engineers. The underlying principle is to control relays, which may be inserted anywhere on the general system of mains, by means of a small, superposed, high-frequency alternating current impressed on the main current flowing in the system. This extra ripple does not affect the lamps or other apparatus in use, and as long as the feeder busbar voltage is kept constant, the amount of power supplied to consumers is practically unaffected. The output of the main generators is simply reduced by an amount equivalent to the power produced by the "ripple generator," which is simply a small alternator in series with them. In case of a continuous-current supply the matter is simple, as a condenser in series with the relay will protect it from the main current, but allow of its operation by the superposed alternations. With alternating currents, however, the relay must be made selective, so as to respond only to the desired frequency, and this has advantages in the case of continuous currents also. This effect is obtained by arranging a suitably proportioned condenser and inductance to form a resonating circuit. Unless, however, the resonance be made unduly sharp, or there be a very large difference between the frequencies, the condenser and relay may let through sufficient current at the supply frequency to attract the armature. To get over this difficulty an additional compensating circuit may be added, as in Fig. 1.  $L$  is the relay coil, the armature

FIG. 1.

FIG. 2.

ALTERNATIVE CONNECTIONS FOR COMPENSATING RELAY.

and core being omitted for the sake of clearness. On top of this coil is wound a second coil,  $L_1$ , which may have, roughly, the same number of turns, and this coil is connected in series with a choking coil,  $L_2$ , having a high self-induction. The current through the condenser  $K$  and relay coil due to the supply frequency, say 50, leads almost  $90^\circ$  on the applied potential difference. The current through the choking coil  $L_2$  and compensating windings  $L_1$  is made to lag about  $90^\circ$ . If these two currents be adjusted to approximate equality, their action on the core of the relay can be made very small. It cannot be completely eliminated, because the two currents are not exactly at  $180^\circ$  to one another, but it is sufficient for practical purposes. By making the choking coil  $L_2$  with an adjustable air-gap in its magnetic circuit it is very easy to adjust the compensation. A compensated resonance relay of this sort will work with certainty at 5 volts at 200 frequency, and will take no notice of 100 volts at 50 frequency.

In practice the alternative arrangement shown in Fig. 2 is adopted with only one winding on the relay coil. This, although electrically identical with that in Fig. 1, may be looked upon as functioning in a different way. Due to the pressure of supply, a certain current flows at the lower frequency through the condenser  $K$ . We may supply the greater part of this current without taking it from the mains

by placing a choking coil in parallel, and adjusting the choke coil so that its self-induction and the capacity of the condenser are practically in resonance for the supply frequency. The actual relays in use consume only about 0.7 watt, and are of simple compact and robust construction.

The superposed ripple is obtained by a small alternator driven, in the case of the Staines installations, by a synchronous motor, and carrying through its armature the whole output of the main generators. The ripple voltage here is 140 volts at 200 cycles, and this is superposed on to the 2,000-volt 50-cycle, single-phase circuit. The connections are shown in Fig. 3, where  $G G$  are the main generators and

FIG. 3.—CONNECTIONS OF RIPPLE ALTERNATOR.

the higher frequency machine. It is put in and out of action by opening and closing the field circuit by the two cam-worked contacts  $L_1$  and  $L_2$ , one giving a sharp make and the other a sharp break. The armature can be cut out when required by the short-circuiting switch  $T$ , and a short spark-gap  $g$  is provided to prevent interruption in case of accident to the armature.

Although these ingenious resonance relays (to which the name "Handyell" has been given) were, we believe, originally designed with this two-rate system of charging in view, there are a number of other applications to which they may be put. The fact that they will respond only to a given frequency with an accuracy of timing well within 5 per cent., makes it quite possible for a number of differently timed relays to be placed in one circuit and any one picked out and operated independently of the others by sending a ripple of the right frequency, and this is easily controlled by varying the speed of the alternator. Thus, a relay with a rocking arm and two solenoids can be made to switch a street-lighting or other circuit on when one frequency is sent, and to switch off with a different frequency, and all that without affecting other relays in the system for other purposes. By this means considerable saving can be made, owing to the greater accuracy of lighting up that can be obtained over a system where a man makes a tour of the district to switch on by the employment of apparatus which, we are told, will prove cheaper than reliable clock-switches. There are also fields for the use of the system in railway and other signalling, train dispatching, &c., where the freedom from liability of interference by stray currents should prove of value. We look forward to interesting developments with this apparatus, the certainty of action of which is largely the result of the great perfection which has recently been obtained in the manufacture of condensers.

## THE STARTING OF INDUCTION MOTORS

A PAPER entitled "Starting and Speed Control of Induction Motors" was read by Mr. F. C. Aldous before the Manchester Local Section of the Institution of Electrical Engineers a short time ago. Squirrel-cage and slip-ring motors for two- or three-phase working only are considered, some general descriptive matter and details being given in opening. In general the horse-power of a squirrel-cage motor which has to start on heavy load should not exceed about 5 per cent. of the k.v.a. of the total minimum generating plant, or 10 per cent. if it starts on light load. On a large power system lower figures than the above would be taken. On a self-contained system these figures may be doubled, since the permissible voltage drop will be greater.

For variable speed work the author points out that slip-ring motors are generally used as with squirrel-cage machines, where lower speeds are obtained by reducing the stator pressure the stator current is increased and consequently the heating of both rotor and stator. Discussing the question of mine ventilating-fan driving, the author points out that during the development of a new pit a fan may have to run for long periods at a reduced speed. A slip-ring

motor with rheostatic control would not be desirable, but both multi-speed and cascade motors can be used with advantage, though separate motors for the two speeds are sometimes preferred. In the case of rope-driven fans the different speeds can be obtained by changing the driving pulley.

Speed reduction of fans is also required for short periods, as, for instance, where a lower air-pressure can be used over the week-end. In this case a slip-ring motor with rheostatic control is often the best system to adopt, for though the efficiency of motor and rheostat at reduced speeds is certainly low, the power diminishes so rapidly as the speed is reduced that the loss is relatively small.

It is found that when a squirrel-cage motor starts against an inertia load, the total energy absorbed and the heating during the starting are independent of the starting voltage, neglecting the heat dissipated. If the load consists partly of friction the energy and the heating are reduced if the starting voltage be increased. It follows that when starting such loads as compressors, tube mills, &c., a high starting

SPEED AND TEMPERATURE RISE OF ROTOR DURING STARTING.

voltage is advantageous, whereas for loads consisting chiefly of inertia the value of the starting voltage is not so important. A further law is that when the starting conditions imposed on a motor are fixed, the friction torque fixed but the inertia varied, the time of starting, the total energy absorbed, and the heating vary as the inertia to be started—neglecting the heat dissipated and resistance changes. For squirrel-cage motors, since the starting voltage is fixed, the torque developed at any particular speed is fixed and the friction torque is fixed, therefore the torque available for acceleration at any particular speed is fixed, so that it is inversely proportional to the inertia, and the kilowatts input and current at any speed are constant, since the voltage is fixed, from which it follows that the time of starting, the total energy absorbed, and the heating of the motor are proportional to the inertia of the load.

Discussing the question of starting torque the author points out that for its determination it is necessary to determine the starting or short-circuit current. Motors which have an unusually large short-circuit current can be built with a relatively small slip and still develop a good starting torque, since the slip is decided not only by the starting torque required, but also by the short-circuit current. Sufficient starting torque can usually be obtained by taking a normal slip of 4 or 5 per cent., though on motors of large size this can generally be reduced. High-speed motors, especially for pump driving, requiring a comparatively small starting torque, are generally designed with a normal slip of not more than  $2\frac{1}{2}$  to 3 per cent.

When specially heavy starting torque is required, as for crane motors, and motors for operating sluice valves or small compressors, squirrel-cage motors are built with rotors of much higher resistance, giving a slip of 8 to 10 per cent. at normal load. The rotors are specially built to withstand the heat developed in them without deterioration, and are generally started by switching on full voltage. Crane motors are controlled by varying the terminal pressure by an auto-transformer with tapings.

A motor with a good overload capacity and a normal slip of 5 per cent. will give a good starting torque without taking an excessive current. In no case is there much advantage in increasing the slip above 10 per cent. The smaller the slip the better the efficiency. As an example of the effect of incorrectly calculating the starting current it is pointed out that if the actual starting current is 20 per cent. lower

than that estimated, and if twice normal torque was expected, only  $1\frac{1}{3}$  times would be obtained with the same voltage.

The question of heating is discussed with reference to a 100-h.p. squirrel-cage 500-volt 50-cycle motor driving a ventilating fan delivering 100,000 cub. ft. of air per min. If the variations of resistance are taken into account a characteristic similar to that actually obtained on test is arrived at. Starting where the motor is switched on with the rotor cold, the curves of speed and rotor temperature are shown in the curve reproduced. A point is arrived at, where the heat dissipated is equal to the  $I^2R$  rotor loss, and after this the rotor begins to cool, in this case at 80 per cent. of full speed after eighteen seconds. When switched over to full pressure the rate of cooling is momentarily reduced. The cooling curve is produced backwards, and is continued for about a minute, showing that the rotor cools very rapidly, and after about one minute almost attains its normal temperature. When first started, the rotor heats up so rapidly that, though the current is diminishing, the rate of heating increases, since the resistance of the rotor is increasing. It is seen that after thirty seconds, when the motor is nearly up to speed, the rotor still has a temperature rise of  $95^\circ\text{C}$ ., corresponding to an increase in slip of nearly 40 per cent. above its slip when cold. On switching over to full pressure the motor attains a speed of 712 r.p.m., and gradually creeps up to its normal speed of 720 r.p.m. as the rotor cools. The rotor has a maximum temperature rise of  $126^\circ\text{C}$ ., meaning an actual temperature of perhaps  $150^\circ\text{C}$ . This may appear excessive, but a rotor of good design and construction can stand temperatures far in excess of this. At normal load the rotor has a temperature rise of less than  $20^\circ\text{C}$ ., and the heating during starting is entirely local, since there is not sufficient time for heat to be transmitted to the stator. The rise could be reduced by using more metal of a higher specific resistance, but giving the same actual resistance. This is not, however, necessary, except with motors which are continually starting and stopping. Though the temperature of  $150^\circ\text{C}$ . is not sufficient to melt solder, its use is undesirable. Any screwed or riveted contacts would deteriorate, even if the design and workmanship were very carefully carried out, and the only thoroughly satisfactory design is one in which all the contacts are brazed or welded. In experiments on different contacts some years ago, it was found that the pressure drop on a tightly screwed or riveted contact was so small when the contact surfaces were clean that it was indistinguishable from the solid metal, even when the surfaces in contact were very small. However, even with machined and accurately fitting surfaces, on alternately heating the test pieces to  $200^\circ\text{C}$ . and cooling, the contact drop was found to increase very rapidly. In addition, vibration has a very bad effect on squirrel-cage rotors, and cases are known where, through these causes, the rotor has become practically open-circuited. In the early history of the induction motor there was very little trouble of this nature. Thousands of induction motors are in operation to-day with soldered rotors or with riveted or screwed joints. Many give no trouble, many others do.

There is no doubt that the rotor is the weakest part of a modern squirrel-cage motor, if screwed, riveted or sweated. All the joints should therefore be brazed or welded.

#### DISCUSSION.

Prof. MILES WALKER (Manchester Municipal School of Technology) said he was partial to the use of an auxiliary machine giving a back E.M.F., and thought this form of regulation would be widely employed for large motors. He considered the booster arrangement the simplest, and gave an example of its application, from which it appeared that a steady and gradual speed variation of about 20 per cent. could be obtained on an induction motor of 1,000 k.v.a. by means of a booster of 100-kw. capacity excited by a 10-kw. exciter. The brushes of the booster were fixed and were connected to the windings of the motor, while the booster field windings were connected to the brushes of the exciter, which were adjustable.

Mr. K. M. FAYE-HANSEN (British Westinghouse Co.) said that with modern slip-ring motors the current rush, on switching on at full voltage, might be larger than that caused by an equivalent squirrel-cage motor starting off an auto-transformer. Squirrel-cage motors were bad for variable-speed work, since their maximum torque was reduced as the square of the voltage, causing on low speeds a considerable variation in speed with changes in load, and a tendency to instability when large torque was required. Where pole-changing was adopted for speed variation it was still usually necessary to use the tapings on the auto-starter before changing from one speed to another. An auto-starter starting a motor light on a lower tapping would not be smaller than an auto-starter to start the motor against a torque using a higher tapping. He considered multiple-point auto-starters unnecessary. He thought the cooling effect of iron core would considerably modify the

author's heating curves, and pointed out that at the moment of switching on, the density in the rotor would be about 26,000 amps. per sq. in. He referred to a system of construction without joints, in which the winding is punched out of sheets, which are afterwards pulled into shape and put in the slots. A winding with independent short-circuited turns had the advantage that the tendency to creeping speeds due to higher harmonics in the field form was reduced.

Mr. W. CRAMP (Manchester Municipal School of Technology) pointed out that the author's formulae depended on the voltage and current being proportional. In many cases this would not be so, as, for instance, in starting, when the saturation would be very high. The heat capacity of the core and insulation appeared more important than the heat capacity of the windings.

Mr. EUSTACE THOMAS (Bertram Thomas) thought that the suggestion of starting up a mill altogether with the generating plant would not be satisfactory, because of the friction at the start, especially after standing the week-end.

Mr. J. FRITH (Manchester Municipal School of Technology) pointed out that the rotor conductors of squirrel-cage motors must either be properly insulated throughout, or else properly grounded all round. A light insulation was no use.

The Chairman, Dr. E. W. MARCHANT (Liverpool University), said a few words in calling on Mr. ALDOUS, who replied briefly.

## HUNTING OF ALTERNATORS

A PAPER entitled "Some Factors in Parallel Operation" was read by Mr. A. R. Everest before the Institution of Electrical Engineers on February 15th, having been previously read in Birmingham on the 12th. The author draws attention to the discrepancies often arising in practice between the actual and calculated natural oscillating frequency of alternators. The Paper shows the nature of the correction necessary, and a means of applying it.

The natural period of oscillation per min.,  $f_0$ , is conveniently expressed by  $f_0 = 9.76 \sqrt{(K_w \times \text{frequency} \div \text{stored energy in foot-tons})}$ , where  $K_w$  = synchronising power in kilowatts corresponding to one radian (electrical) of displacement from the mean position. Fig. 2 represents the E.M.F. triangle for two machines when de-phased. The cross-voltage or impedance E.M.F. consumed in one machine (CA) for small deviations is proportional to the radius voltage for one radian of deviation.  $K_w$  is therefore determined by the cross-current flowing in one machine to consume a cross-voltage equal to

FIG. 1.—TEST CURVES FOR 1,500-kw., 6,600-volt ALTERNATOR.

FIG. 2. VECTOR DIAGRAMS FOR USE IN CALCULATING SYNCHRONISING POWER.

FIG. 3.

the working voltage. It is in this determination that errors arise. The usual methods indicate that the current circulating in the machine on short-circuit with excitation corresponding to the air-gap excitation for no-load working voltage (AB not AC in Fig. 1) be used.

The author points out that the case of power exchange current between two machines due to a given cross voltage, is much larger than when on short-circuit; hence the synchronising power as determined from the latter test is usually far too low. In parallel operation the angles of deviation are small, and the cross and machine voltages 90° apart. Since the circuit is highly inductive, on the short-circuit test the circulating current acts only demagnetisingly on the field-poles, but under actual working conditions the cross-current is a true power current, and only distorts the field flux. Other factors which need to be taken into consideration are the different magnetic reluctances in the different directions. This method can be used if the results are multiplied by certain correcting factors, but a preferable method is deduced from a consideration of Fig. 3, where the angle of AOC of mechanical displacement is divided into two parts,  $\phi$  being that by which the flux axis is displaced from the pole axis by distortion. The actual E.M.F. triangle is  $DOC$  (for one machine), and the real cross voltage  $DC$  is consumed as reactive drop in the machine winding. The angle  $DOC$  is given by the reactive drop, and the angle of flux distortion  $= K \times \text{armature amp.-turns per pole} \div \text{field amp.-turns per pole at air-gap}$ .

When the air-gap is not uniform from centre to edges, a further correction of 10 per cent. is suggested. For values of pole arc  $\div$  pole pitch from 0.4 to 1.0, the value of  $K$  in degrees varies from 7.0 to 40.0.

For smooth cylinder field magnets this method gives results similar to those obtained from the short-circuit method, but for flywheel alternators it is shown that the synchronising current flowing for a given angle of displacement would be very much larger than indicated by the short-circuit method. The value of winding reactance employed in this method should, as suggested by Hobart, include only that part which lies within the armature surface. In general, it is sufficiently accurate to take a value of one-half that determined in the usual way.

Examples are given to show the inaccuracy of the ordinary method. Fig. 1 shows the open-circuit and short-circuit tests on a 1,500-kw. 6,600-volt 2-phase 50-cycle machine. The oscillating frequency calculated by the short-circuit method was 40.5 per min. The "distortion" method indicated a natural frequency of 68, or without correction for variable air-gap, 63. The frequency by actual test was 68.

The author agrees with the investigators Goerges and Boucherot, who advocated that for any load the natural frequency should be calculated on the internal generated and not the terminal voltage.

In the case of dissimilar machines A and B, it is shown in the Paper that in general, writing  $K_a K_b$  for the  $K_w$  values of A and B, each calculated as one of a similar pair, the resultant value for A and B together is  $= 2K_a K_b \div (K_a + K_b)$ .

Similarly with two unequal flywheel effects,  $a$  and  $b$ , the resultant value may be expressed in the form:  $2ab \div (a + b)$ . For two machines with any values of electrical constants and flywheel effects,  $T_a$  and  $T_b$ , the natural frequency is given by:—

$$f_0 = 9.76 \sqrt{\{(\text{frequency} \times K_a K_b (T_a + T_b) \div T_a T_b (K_a + K_b))\}}$$

The flywheel requirements are given as follows:—Angular deviation from uniform rotation due to cyclic irregularity of engine not to exceed  $2\frac{1}{2}$  electrical degrees. The permissible limit of cyclic speed irregularity  $= 1/a$ , where  $1/a = k/(6 \times \text{no. of poles})$ , and  $k$  is the no. of engine impulses per rev. To avoid trouble from resonant hunting, the natural frequency should be at least 20 per cent. different from the frequency of the predominating engine impulse. In a 2- or 4-stroke cycle engine this always occurs with the frequency of the cam-shaft, and is independent of the total number of cylinders. For operating A.C. generators of ordinary regulation, the total amount of fly-wheel effect required for each kilowatt of rating may be indicated by the following formula—

$$1.3 \times \text{poles} \times (\text{strokes per engine cycle})^2 \div \text{r.p.m.}$$

Professor Miles Walker (Manchester Municipal School of Technology) opened the discussion in London. He pointed out that the subject was assuming importance again owing to the Diesel engine bringing back to life the flywheel alternator. He could not agree that one should neglect the ampere-turns required for the teeth or for the pole-faces, which were of importance in turbo-machines. All designers knew that the short-circuit formula was not correct, and they applied a correction by taking the total ampere-turns. The only object being to get a flywheel which would not resonate, there was only need to use a formula which brought them as far as possible from the danger point. Mr. Everest's formula would be of use in designing rotary converters. Neglect of the possibility of resonance was responsible for the bad reputation they had obtained in the past, especially as the dampers fitted were generally inefficient. These should be practically complete squirrel-cages. He then showed some tachograph records of machines hunting. In a certain case, when designing a 5,000-ampere 1,000-kw. rotary, he found that one engine on the system had a frequency of disturbance of 115 cycles per min., and another of 75. The rotary also resonated at 75, but by adding an A.C. booster and altering the air-gap, the frequency was brought up to 94 cycles per min. He then showed some of Dr. Rosenberg's curves of fly-wheel effect (ELECTRICAL ENGINEERING, Vol. V., Feb. 4th, 1909, p. 110), with a curve calculated from Mr. Everest's formula added. This practically coincided with the safety curve obtained by Dr. Rosenberg. Dr. W. E. Sumpner (Municipal Technical School, Birmingham) also gave an example of this and a formula of his own, which he compared with that of Mr. Everest. He advocated the use of simplified formulae by the use of electrical instead of mechanical units, thus 1 ft. ton = 1 kw. for 3.04 seconds. Professor R. Threfall (Birmingham) and Dr. S. P. Smith (City and Guilds Engineering College, London) remarked on the vastness of the subject, and thought that at present the study of the whole subject was insufficient and inconclusive. Mr. W. Duddell read a communication from Dr. E. Rosenberg (British Westinghouse Co., Ltd.). He wanted more examples to convince him that the formula would be correct in every case, and he took exception to the flywheel requirements specified. Dr. G. Kapp, Dr. M. Kahn, and Messrs. Clough and Shuttleworth also spoke in Birmingham, and Mr. Everest replied at length in each case to the points raised.

### FACTORY LIGHTING

THE British Thomson-Houston Co., Ltd. (Mazda House, Upper Thames Street, E.C.) have sent us some notes describing the lighting of a factory at Deptford, which has been equipped with their lamps and reflectors in accordance with designs prepared by their illuminating engineer's department. The factory is that of De Fries, Ltd., and it consists of six fairly large shops, five offices, and two chemical

FOUNDRY LIGHTED BY METAL FILAMENT LAMPS IN WATERTIGHT LANTERNS.

laboratories. Mazda lamps are used throughout; in the offices they are equipped with Holophane reflectors and in the workshops and laboratories with Mazdalux metal reflectors. In the case of the drawing offices and the chemical laboratories, where intense local illumination is necessary, the reflector units are attached to wall-brackets, fixed in such a position that the light is concentrated on the required areas. In the other offices and the workshops general illumination is provided by Holophane and Mazdalux reflectors, containing Mazda lamps, spaced evenly over the ceiling. As a protection against dust, &c., the reflector units in the foundry are contained in B.T.H. watertight lanterns. These lanterns in no way interfere with the reflection or distribution of the light, but they do prevent the corrosion and impairment of the reflector surfaces. The total area of the foundry is 6,308 sq. ft., and it is lighted by twelve 200-watt Mazda lamps, equipped with Mazdalux reflectors, each unit being completely enclosed in a watertight lantern. A practically uniform intensity of illumination is given over the working plane, varying only between 2.5 and 2.6 foot candles. The pattern shop, with an area of 1,752 sq. ft., is lighted by fourteen 40-watt points, equipped with Mazdalux reflectors. An illumination intensity varying between 1.45 and 1.5 foot candles is given. In the carpenters' shop, thirteen 80-watt Mazda lamps under Mazdalux reflectors illuminate an area of 2,405 sq. ft., with an intensity of 3.6 foot candles. The aim throughout has been to obtain uniformity and adequacy of illumination without glare, and the owners fully realise that these qualities react on the workers, conserving their eyesight, making the conditions more cheerful and tending generally to increase the output.

**Electrically-driven Fire Escape.**—In our description last week of the electrically-driven "turn-table ladder" just supplied to the London County Council, the time taken by the 6-h.p. motor to extend the ladder to its maximum height of 90 ft. was given as 90 seconds instead of ten seconds. The time taken by the compressed gas engines usually employed to perform this operation is about 18 seconds (depending on atmospheric conditions), while two minutes is required if manual power is used.

**Electric Drive in a Woodworking Yard.**—In our article with this title on page 48 of ELECTRICAL ENGINEERING of Jan. 23rd, one of the saws made by John Pickles & Sons was described as capable of making one cut up to 48 inches at the rate of 2 inches per minute. The Adams Manufacturing Co., who supplied us with the information, now ask us to state that the speed should be 2 feet per minute.

### A NEW FUSE BOX

MESSRS. Siemens Brothers & Co., Ltd. (Woolwich), are placing a new house fuse-box on the market for currents up to 15 amperes, which is neat in appearance, compact, and, we understand, low in price. The illustration, which is half actual size, shows a fuse-box wired with Stannos wire on the concentric system. The continuity of the Stannos sheathing is maintained by means of "Twiston" connectors

NEW PATTERN HOUSE SERVICE FUSE FOR STANNOS WIRING.

terminating at the left-hand corner, and efficient contact is ensured by means of the screw, as shown. The box is also quite suitable for use with ordinary braided wires.

### AN OIL SWITCH FOR LOW VOLTAGES

THE British Westinghouse Company, Ltd. (Trafford Park, Manchester), have brought out a small oil-break switch suitable for switchboard mounting on A.C. 3-phase 50 periods circuits up to 135 amps. and 650 volts. It is of metal and mica construction, and its simplicity and neat appearance can be seen from the illustration. The connections to the stationary contacts pass out through the side of the slate slab, as this arrangement is usually more convenient than taking the leads vertically up or down from the switch. The overload coils, on the left-hand side, operate the tripping bar in the ordinary way. On the right-hand side of the switch the no-volt release coil is fitted. The switch is fitted with a loose handle arrangement to prevent it from

OIL SWITCH WITH OIL CONTAINER REMOVED.

being closed against a short circuit or an excessive overload; also it is impossible to close the switch when there is no voltage on the circuit. The three moving contacts are mounted on a steel bar, insulated with moulded mica. The rods which connect this bar to the operating mechanism are of steel, and pass through guides secured to the base of the switch, thereby ensuring that the moving contacts have a parallel motion. It will be noticed that spiral springs are fitted, thus giving a quick break action.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelopes.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,327.

A magnet is wanted to give a direct effort of about 120 lbs. on a brake shoe, applied direct as a push not more than  $\frac{1}{2}$  in. from a simple bearing knob on the solenoid. The current available is 200 volts D.C. Give dimensioned sketches sufficient for construction, with particulars and calculations of the winding and of a resistance to bring on the full effort slowly.

"MAGNET BRAKE."

(Replies must be received not later than first post, Feb. 27th.)

### ANSWERS TO No. 1,325.

In cases where electric trains with collectors at both ends run through from the lines of one company to those of another fed from an entirely independent power-house, by what means are excessive interchanges of current avoided at the moments when the train puts the two systems in parallel, if the voltage on one line happens to be much in excess of that of the other?—R.

No replies of sufficient merit for an award have been received. The method employed in some cases is to provide a length of neutral rail as a "section insulator" between the systems and to connect up one end only of this to the live rail through a resistance, which is, of course, only in circuit as a train passes from one system to the other. Switches are also provided so that in case of emergency both systems can be connected through.

## ANSWERS TO CORRESPONDENTS

FLUX asks the following question:—A 35-h.p., 3-phase, 440-volt, 25-cycle, 4-pole slip-ring motor just tested starts light with the rotor windings on open circuit, and runs up to 640 r.p.m. When the slip rings are short-circuited the speed becomes 750. The slip on load is normal. There is no short or earth or rotor windings. Both stator and rotor cores are machined all over, the slots are half closed, and gap 1 mm. The leakage coefficient, tested, is 0.04. Why does the motor start as described?

The motor starts up by means of the eddy currents induced in the rotor, but these are not sufficient to give much torque, so that even the ordinary friction is sufficient to prevent full speed being attained.

T. HUGHES (Liverpool).—The makers of the carbon brush that you sent are the Morgan Crucible Co., Ltd., Battersea Works, London, S.W.

**The Electrical Trades Benevolent Institution.**—The annual festival dinner which is to be held on Wednesday, April 16th, will be presided over by Mr. G. Sutton (Henley's Telegraph Works Co.). It is announced that arrangements have been made with the Provident Clerks' and General Mutual Life Assurance Association for members of the Institution to effect life assurances on particularly easy terms, and the Institution will add 10 per cent. to the amounts assured when paid, in a similar way to that adopted by the Railway Benevolent Institution.

# MODERN ENGINES AND POWER GENERATORS.

By Rankin Kennedy, C.E.

The Coupon below entitles any reader to a complimentary copy of an illustrated booklet, describing what is probably the most valuable work upon this subject ever published.

The importance of the subject is growing day by day, and "The Book of Modern Engines and Power Generators" can easily prove of the greatest value to those who desire to be fully informed upon the latest developments in every branch of the subject.

The author, Mr. Rankin Kennedy, C.E., is well known as an authority on his subject, and in this work he explains in the clearest and most thorough manner the design and construction of prime movers; the term is here used in its widest sense, as it applies to all engines, whether worked by petrol, oil, steam, air, gas, water, or electricity, and as it includes all machinery and processes connected with power generators and distribution.

### ENTIRELY UP TO DATE.

Moreover, all these subjects have been brought entirely up to date. The previous Edition of the work achieved such an immediate success, that for the new and Revised Edition, the scope of the work has been widened and extended so as to cover every branch of the subject, by the addition of a great amount of new matter, and many new illustrations of very great interest and high value.

This new Edition is indeed already recognised as the standard work on its many varied subjects, including Rotary Engines, Gas Turbines, Gas Engines, Oil Engines, Petrol Engines, Suction and Producer Gas Engines, Blast Furnace Gas Engines, Marine Engines of every design and type, Compressed Air Motors, Air Compressors, Refrigerating Engines, Windmills, with electric storage, Fluid Hydraulic Engines, Water Pressure Engines, Hydraulic Rams, Water Pressure Turbines, and Water Raising Engines, Centrifugal Pumps and Air Lifts, Power Distribution and Transmission by Gearing, Water Pressure, Compressed Air and Electricity, etc., etc.

### OVER 2,000 ILLUSTRATIONS.

The work is profusely illustrated by diagrams, text-cuts, and plates. In all there are over 2,000, every one of great practical utility to the engineer.

Enough has been said to show that this work is indispensable to all electrical, mechanical, steam, and hydraulic engineers, and to all who are concerned with manufacturing, designing, draughtsmanship, electro-chemical, and metallurgical work, with automobiles, tramways and railways, boilers, shipbuilding, collieries and mines, etc.

We would advise those who are determined to keep abreast with all the latest specialist knowledge concerning every detail of their profession to send for the free booklet which is supplied by the publishers to those mentioning this paper.

## A FREE BOOKLET.

To the CAXTON PUBLISHING CO., LTD.,  
97, Surrey Street, London, W.C.

Please send me, free of charge, a copy of the book describing the "Book of Modern Engines and Power Generators," and showing how it can be obtained for a first payment of 1s. 6d., the balance to be paid by small monthly payments.

# "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

## Specifications Published Feb. 13, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

26,485/11. **Water Heater.** J. MANN. Copper tubes are bent into a grid formation and covered by tubular pieces of silica, on which is wound the heating coil, covered with a mixture of silica and lime, which is fired after being applied. One figure. [This is one of the patents on which the formation of Vacuum Electric Heaters, Ltd., was based (ELECTRICAL ENGINEERING, Vol. VIII., August 29th, 1912, p. 480.)]

1,680/12. **Automatic Regulator Switch.** B.T.-H. and E. GARTON. A knife switch is fitted with an auxiliary switch consisting of a spring-pressed plunger which bridges fixed contacts attached to studs carrying the main contacts when the knife switch is closed. Such a switch may be used on A.C. systems where current transformers are used to supply compounding coils on the regulator. The transformer may then be directly across the compounding coil when the switch is closed. The auxiliary switch controlling the transformer circuit is actuated by the knife switch, so that it opens the transformer circuit after the knife switch is closed, but before the fully closed position is reached. On breaking circuit the transformer is again short-circuited just before the compounding coil is disconnected. The combined switch may also be used for transformer switching. Three figures.

2,284/12. **Spiders for Metal Filament Lamps.** DEUTSCHE GASGLÜHLICHT. From a central stem radiate practically rigid arms at the socket end and elastic hooked arms at the other end. The ends of the rigid arms are made in the form of helical loops. Three figures.

2,874/12. **Vehicle Lighting.** B.T.-H. and E. GARTON. In systems where energy for lighting is supplied by a variable-speed generator and a storage battery in parallel, a resistance is used in series with the battery. This resistance is short-circuited in whole or in part by a suitable switch when heavy discharges have been taken from the battery. One figure.

3,281/12. **Petrol-electric Traction.** H. PIEPER. This specification relates to systems where an internal-combustion engine is coupled to two dynamos, one of which is connected with a buffer battery, while the other supplies the driving motors. Connections are shown by which the circuits of the two dynamos are separate for low speeds and in series for high speeds. Only the machine in parallel with the battery need be used when the pressure of each machine is the same. Two figures.

5,434/12. **Charging Storage Batteries.** K. VON DREGER. To minimise the loss in the series resistance generally used in charging small accumulators from lighting and power mains, the cells to be charged are connected in parallel with a large storage battery through series resistances. This storage battery is permanently in series with the mains. One figure.

9,619/12. **Adjustable Portable Standard for Incandescent Lamps.** A. S. LYHNE. One clamp only is used, but the movements are independent, one not affecting the others. Nine figures.

10,042/12. **Locomotives.** P. DAWSON and S. J. LUCAS. Driving motors are fixed on the frame with their axes above driving axles. Countershafts are arranged in approximately the same horizontal plane as the driving axles. The countershafts are connected to the motors and driving axles by chain or other flexible gearing. Two figures.

12,709/12. **Telegraphic Photography.** C. STILLE. Instead of the ordinary plate in a camera, a photo-electric cell consisting of two silver plates in sulphuric acid is used. The plate facing the interior of the camera is covered with a halogen salt. Its area is about 4 sq. in. The image is exposed successively in strips to the cell through a perforated opaque band. The cell is connected to a telephonic relay. By this means, a local battery and a similar apparatus to the Poulsen telegraphone, a varying current is sent through the line where it affects a magnetisable receiving wire in a similar way. The variations of magnetism in this wire are transformed into variations of light in any of the well-known ways. Three figures.

13,327/12. **Determining Temperature of Sea-water.** W. S. LAYCOCK and J. J. HICKS. At various heights up the stem of a thermometer, connections to indicating circuits on the ship are made, so that the position of the mercury determines which is closed. Three figures.

16,044/12. **Manufacture of Fireproof Moulded Conductors.** GEB. SIEMENS. A mixture of carbon and silicon is heated in an atmosphere of carbon monoxide or dioxide, so as to produce a moulded body of SiCO and free carbon. It is then heated to 1,600-1,700° C. in a non-oxidising atmosphere. The body remaining is composed by SiC.

## Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** BULLERS and TWISS [Insulators] 6,287/12; BÖLLING [Producing sheet mica from waste], 21,445/12; SIEMENS-SCHUCKERT [Motor speed regulation] 23,341/12.

**Electrometallurgy:** GONNET [Furnaces] 19,287/12.

**Heating:** SCHENBERG [Water heaters] 2,522/12.

**Ignition:** RUPRECHT [Spark plugs] 28,412/12.

**Instruments and Meters:** RECORD [Moving coil] 3,454/12.

**Switchgear, Fuses, and Fittings:** LEITNER [Auto-battery over discharge preventer] 2,310/12; [Switches] 2,747/12; ROBB and SHAW [Cable lugs] 5,907/12; SCHUCHARDT [Incandescent lamp sockets] 12,692/12; BEUTTELL [Reflectors for linear sources of light] 12,989/12; VENNER's and GRIESBACH [Switches] 15,366/12; CHIGER [Time switches] 16,142/12; TERRY, BIGWOOD, and BROTHERTON TUBES & CONDUITS [Conduit junction boxes] 24,492/12.

**Telegraphy:** FRASER and EASTERN TELEG. CO. [Perforated tape operated typewriters] 1,822/12; VLUG [Wireless] 10,111/12.

**Traction:** VIRGILI [Submarines] 21,444/12; PIEPER [Engine-electric] 29,636/12.

**Miscellaneous:** WRIGHT and NIBLOE [Fly and insect trap] 2,872/12; GRAY [Gyrostats] 2,877/12; BRUKWICKI [Change speed and reversing gear] 4,458/12; PORDES [Portable battery lamps] 11,359/12.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Electrometallurgy and Electrochemistry:** CHAUMAT [Manufacture of chrome alum] 1,636/13.

**Ignition:** MASCOV [Reducing duration of sparks produced by magneto] 27,094/12.

**Incandescent Lamps:** FISCHER [Rendering metals ductile] 8,720/12.

## Opposition entered to Grant of Patent

26,184/11. **Furnaces.** V. STOBIE. A furnace is described for melting, reduction, or refining by illuminating gas or oil, and electricity. A steel melting furnace is illustrated. The fuel enters through pipes terminating in suitable burners depending from the roof, where also are the electrodes.

## Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

4,124 of Feb. 24th, 1899. **Combined Radiator and Convect.** H. J. DOWSING. Several tubular incandescent lamps are arranged in front of inclined reflectors. These, together with a back cover, form triangular channels by which air ascends, becomes heated, and is directed forwards by a sloping roof over the tops of the lamps.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Arc Lamps:** P. HÖGNER [Inclined carbons fed by weight or spring controlled by escapement and electromagnets, or by a motor and switch. Lateral movement strikes arc] 23,606/02.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** H. HIRST and C. E. GUNNER [Covers of junction boxes: Non-loosable bolts] 23,944/06; C. A. DAY (*Elek. Zünder Ges.*) [Moulded or cast resistance] 23,778/07.

**Dynamos:** H. G. REIST [Turbo-alternators] 23,951/06.

**Electrochemistry and Electrometallurgy:** A. SCHNELLER and D. KOELEMAN [Silent discharge tube] 25,375/03; W. P. DIGBY [Construction of bath for obtaining hypochlorites by electrolysis] 21,949/05; FELTEN & GUILLEAUME LAHMEYERWERKE [Steel refining furnace] 24,213/07.

**Incandescent Lamps:** B.T.-H. (*A.E.G.*) [Filament supports of thorium or magnesia] 24,233/06; B.T.-H. (*G.E.C.*) [Electrolytic refining of tantalum] 24,234/06; E. A. GIMMINGHAM [Joining filament to leading-in wires] 23,786/07.

**Switchgear, Fuses and Fittings:** E. H. THEOBALD [Bayonet joint for lamp holders, &c.] 23,991/07.

**Telephony and Telegraphy:** A. C. BARONIO and A. MUIRHEAD [Automatic perforated strip telegraphs: receivers and transmitters] 21,846/05.

**Traction:** E. A. RICHARDSON [Automatic block signalling] 19,875/04.

**Miscellaneous:** M. RUTHENBURG [Magnetic ore separators] 24,422/06; E. J. MURPHY and KELVIN & JAMES WHITE [Electrically-driven sea-sounders] 23,853/07.

# ADAMS IGRANIC

ADAMS  
M<sup>FG</sup> CO<sup>LTD</sup>  
BEDFORD  
AND  
LONDON

ELECTRIC CONTROL GEAR FOR MACHINE TOOLS.

## ELECTRIC TRACTION NOTES

With reference to the rumour that an important announcement was about to be made to the effect that a large portion of the suburban lines of the Midland Railway were to be converted to electric traction, we are authoritatively informed that, although the Company is considering a scheme of electrification in connection with the acquisition of the London, Tilbury & Southend Railway, at the present time nothing definite has been settled.

A special committee has been appointed by the Bristol Corporation to inquire into a proposal to purchase the Bristol Tramways and Carriage Company's undertaking.

A resolution before the last meeting of the Lowestoft Corporation, calling attention to the loss upon the tramway system, and moving for a committee to be appointed to consider the disposal of the undertaking, led to considerable uproar, and the meeting had to be adjourned in consequence.

A special meeting of the Metropolitan Railway Co. has officially sanctioned the purchase of the Great Northern and City Tube Railway. At a previous meeting, as reported in our columns, there was considerable difference of opinion on the question, and an adjournment was made in consequence.

According to the *Elektrotechnische Zeitschrift*, the Reichstag Committee dealing with the proposed electrification of the Berlin Stadtbahn have suspended their sittings until further information with regard to the capacity of improved steam locomotives, the supply of current from outside supply companies, and the proposed increase in fares, has been obtained.

The year 1912 was the first complete year's working of the Torquay tramway system after the change from the dolter surface-contact system to overhead, and the results are quite as satisfactory as was generally contemplated. The Company has been able to increase its dividend from 1½ to 3 per cent., and on all accounts there has been considerable improvement and economy in the working of the service, particularly so in the case with current consumption.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The final sittings of the House of Commons Committee inquiring into the Imperial wireless telegraph scheme were mildly exciting in consequence of the decision of the Committee to report Mr. Leo Maxse, Editor of the *National Review*, which published the articles about which so much has been heard, for refusing to produce certain letters in connection with them which he acknowledges he possesses. Mr. Maxse's evidence is not yet complete, however, and the Prime Minister, owing to the fact that only one day of the session remained when the Committee reported to the House, decided to take no action until Parliament reassembles. In answer to the Marconi Company's letter, in which they stated they would regard the contract as not binding unless it was ratified by Parliament by March 1st, the Postmaster-General has reiterated his former refusal not to release the Company from the contract.

The Marconi Co. has placed contracts for the erection of two pairs of wireless stations for Atlantic and two pairs for Pacific services. The *Electrical World* (New York) announces that receiving and sending stations, thirty miles apart, will be constructed at Oahu, in the Sandwich Islands; Tamales Bay and Bolinas, Cal.; near Belmar, New Jersey, and at a point in eastern Massachusetts. These stations will be part of a globe-girdling system which will continue to the East by way of Japan and thence ultimately to India. Twelve towers ranging in height from 400 ft. to 450 ft. will be spread out over a semicircle covering a square mile at each station,

and it is estimated that the range of each station will be from 4,000 to 6,000 miles.

The *Elektrotechnische Zeitschrift*, referring to certain rumours that the Marconi Company has now complete control of the wireless business of France, points out that the Compagnie Générale Radiotélégraphique, who acquired the French rights of the Lepel system two years ago (see *ELECTRICAL ENGINEERING*, Vol. VI., p. 591), do not come under the Marconi patents, as the Lepel oscillation system works on the shock-excitation principle, and one wave-length only is given out by the antenna. The equipments which will have to be handed over to the Marconi Company are those on the old system, generating at two wave-lengths. The decision granting this confiscation, however, is being appealed against.

A feature of the telephone position now that the Postmaster-General has taken over the National Telephone Co. is the length of time which the license of the Hull Corporation has yet to run, and the strong disinclination of the Corporation to part with their undertaking in view of the satisfactory financial results which have been obtained there. Negotiations have been going on between the Hull Corporation Telephone Committee and the Postmaster-General, and a resolution has been passed by the Committee to the effect that, subject to the terms being agreed, the Corporation are prepared to purchase from the Post Office the plant acquired by them from the National Telephone Co. in the Hull area. This implies that there will be an extension of the Hull Corporation's license.

The Bathurst-Bissao cable was down on the 11th inst., and the Ottoman Government stated on the 12th that the prohibition of secret language in telegrams applies to Smyrna, Constantinople, Gallipoli, Dardanelles and localities in the neighbourhood of the Marmora Sea.—The Bulgarian Office confirms restrictions as to telegrams in code or cypher, and any telegrams written in either language will be stopped.—Telegrams to Mexico City are subject to delay and private telegrams in code or cypher are prohibited for all places in San Salvador.—The El Arich route is down beyond Konia and on the 15th San Salvador cancelled restrictions on private telegrams.—Censorship has been established on all telegrams for Mexico excepting diplomatic dispatches. All traffic is still subject to delay.

Telephone men who may desire to secure copies of any issues of the *National Telephone Journal* (the publication of which ceased after the taking over of the Company's business by the Post Office) are informed that all the seventy numbers are available with the exception of Nos. 1, 31 and 70. Single copies may be obtained price 3d., and for sets of copies "no reasonable offer will be refused." Communications should be addressed to Mr. V. Baldwin, Room 37, Telephone House, Victoria Embankment, E.C.

## CATALOGUES, PAMPHLETS, &c., RECEIVED

**ALUMINIUM.**—A leaflet from the British Aluminium Co., Ltd. (109 Queen Victoria Street, E.C.), deals with the casting of aluminium and some of its alloys, and illustrates some examples of complicated castings in this metal.

**METAL FILAMENT LAMPS.**—A new and effective show-card in black and white has been produced by the Electrical Co., Ltd. (122-124 Charing Cross Road, W.C.), to call attention to "Aegma" drawn wire lamps.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

**CHAIN-PULL SWITCH LAMP-HOLDERS.**—The General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), have sent us a leaflet and particulars of a chain-pull switch lamp-holder similar to that illustrated on page 90 of our last issue, which they are placing on the market in a number of special finishes as well as in the usual polished brass.

## LOCAL NOTES

**Belfast: The New Power Station.**—At a special meeting of the Tramways and Electricity Committee last week it was definitely decided to proceed with the new power station. As reported in our columns, there has been a certain amount of opposition on the part of some ratepayers, and the Tramways Manager also presented a report in which he advised the use of Diesel engines for the tramway service. Mr. Bloxam's scheme, however, which has been approved by Mr. S. L. Pearce, City Electrical Engineer at Manchester, to build a new power station lower down the river to deal with all classes of supply, has now been adopted.

**Birmingham: Future of Electricity Undertaking.**—Councillor Marks will propose, at the March meeting of the Corporation, that the Electricity and Gas Committees be amalgamated into a Light and Power Committee, whose duties shall be to conduct the electricity and gas undertakings.

**Cromer: Electric Lighting Undertaking.**—The poll of ratepayers with regard to the proposed transfer of the Council's electricity undertaking to Edmundsons' Electricity Corporation has resulted in a majority of only 41 in favour.

**Darlington: Increase in Electricity Supply.**—The figures for current generating at the Darlington Electricity Works for December, 1912, are very striking, for they show that 409,041 units were generated, as against 260,435 in December, 1911, an increase of no less than 57 per cent.

**Dundee: Electric Driving.**—An additional four firms have discarded their reciprocating engines in favour of electric driving.

**Gravesend: Increased Cost of Coal.**—In order to counteract as far as possible the extra working expenses due to the increased cost of coal, the Borough Electrical Engineer has recommended the supply of current for cooking purposes during the daytime at 3d. per unit, during the six months ending March, and 3d. per unit during the six months ending September. Supplies at these charges are only to be given to existing consumers in order that no further capital charges may be incurred. The Committee have decided to defer the consideration of the proposal until the report and accounts for last year are completed.

**Huddersfield: Lighting Tariff.**—The Chamber of Trade has proposed to the Electricity Committee against the flat rate of 4d. per unit for lighting purposes, and suggests that, instead of the profits of the electricity undertaking being transferred to relief of rates, the charge to private users should be reduced.

**London: Westminster: Street Lighting.**—It is stated that the City Council has under consideration the question of determining the contract with the Charing Cross, West End, and City Electricity Supply Co. for public lighting in the St. Martin-in-the-Fields district. The Council have the option of determining this at the end of the fourteenth year, which will expire on September 17th, by giving six months' notice. If this option is not taken advantage of, the contract will run for the full period of 21 years. In the event of the contract being terminated, the Council will have to purchase everything in connection with the installation, except any generating plant or distributing mains used for general supply, and the price will be settled by arbitration failing agreement.

**Walsall: Position of Electricity Undertaking.**—The recommendation to appoint a consulting electrical engineer to report on the general position of the electricity undertaking, referred to in our last issue, has been adopted by the Council.

**York: Power Contract.**—The expenditure of £3,000 upon new plant, already reported in our columns, is largely in connection with an agreement with Messrs. Rowntree and Co. for a supply. At the last meeting of the Corporation it was stated that the terms of this contract are not being divulged even to all members of the Electricity Committee, and strong complaints were made. Amendments referring the recommendation back, however, were heavily defeated.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

[Notes of Contracts Open are not repeated under this heading week by week until the last date for receiving tenders, but are only inserted once.]

## Generating Stations, Sub-Stations, Mains, &amp;c.

**Dundee.**—Two water-tube boilers, mechanical stokers, economiser, coal-handling plant. City Electrical Engineer. March 7th. (See advertisement on another page.)

**Halifax.**—Mr. W. Emmott is reporting upon the cost of installing generating plant at St. Luke's Hospital.

**King's Lynn.**—Extensions to the electricity works at an estimated cost of £2,000.

**Liverpool.**—Two 50-kw. generating sets, switchboard, motors, and wiring are required for the Toxteth Workhouse. T. L. Miller, 709 Tower Buildings. February. 24th.

**London: L.C.C.**—Two 8,000-kw. turbo-generators. The time for the receipt of tenders for this plant has been extended until March 4th. (See advertisement on another page.)

**Neath.**—One 400 kw. two-phase generating set. Borough Electrical Engineer. March 3rd.

**Salford.**—Three rotary-converters with the necessary transformers, switchgear and cable connections. Estimated cost: rotaries and transformers, £8,000; H.T. switchgear, £2,000; cables, &c., £2,000. See also article on p. 100.

**Swindon.**—One 500 kw. mixed pressure turbine, switchboard panel and cable. Borough Electrical Engineer. March 10th.

**Wigan.**—High-tension, three-core paper and lead covered armoured feeder cable, transformer and switchgear. Borough Electrical Engineer, February 24th.

## Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

**Canterbury.**—Extensions to asylum, costing £25,000.

**Devonport.**—New Municipal buildings.

**Ilford.**—Electric lighting of South Park School, Water Lane. Architect, C. J. Dawson, 11 Cranbrook Road. March 1st.

**Llandudno.**—New police buildings. J. Holt, 9 Albert Square, Manchester.

**London: Lewisham.**—Electric lighting is to be installed in the infirmary.

**L.C.C.**—Curtain Road elementary school. (See advertisement on another page.)

**Mountain Ash.**—Isolation hospital. W. H. Williams, Town Hall.

**Paisley.**—Proposed art gallery.

**Trowbridge.**—New County Offices. County Surveyor.

**Wallasey.**—New town hall.

**Wood Green.**—Supply and fixing of conduits for electric lighting of Town Hall. Clerk, February 26th.

**York.**—Additions to secondary school for girls. Secretary, Education Offices, Clifford Street.

## Miscellaneous

**Aberdare.**—Twelve months' supply of various stores for Electricity Department. Borough Electrical Engineer. March 3rd.

**Belfast.**—Four 5-ton electric gantry cranes for Harbour Commissioners. Secretary, Harbour Offices. March 12th.

**Birmingham.**—Twelve months' supply of stores, including electrical goods, for the Tame and Rea District Drainage Board. Engineer, Drainage Board Offices, Tyburn, Birmingham.

**Croydon.**—Twelve months' supply of electric lighting sundries for Mental Hospital, Warlingham. Clerk, Town Hall.

Twelve months' supply of meters and fuses, arc-lamp carbons, lamp globes, &c. Borough Electrical Engineer. March 31st. (See advertisement on another page.)

**Great Central Railway Co.**—Twelve months' supply of electrical stores. Stores Superintendent, Gorton. March 4th.

**Hornsey.**—Meters, cables, &c. Borough Electrical Engineer. February 24th.

**London: Hampstead.**—80-watt metal filament lamps are to be substituted for the arc lamps in a number of streets at an estimated cost of £900.

**Fulham.**—Twelve months' supply of electrical stores. Clerk to the Guardians, 129 Fulham Palace Road. March 6th.

**Newport (Mon.).**—Twelve months' supply of stores for Electrical Department. Borough Electrical Engineer. February 22nd.

**Pontypridd.**—Twelve months' supply of cables, insulating materials, meters, &c., for Electric Light and Tramways Departments. Borough Electrical Engineer. March 5th. (See an advertisement on another page.)

**Shipley.**—The Council are considering the question of extending the street electric lighting.

**Southampton.**—Twelve months' supply of stores for electricity and Tramways Departments. General Manager. February 22nd.

**South Wales.**—The Powell Duffryn Steal Coal Co. require twelve months' supply of electrical goods. Particulars, Aberdare. Tenders to 101 Leadenhall Street, E.C. March 10th.

Twelve months' supply of electrical goods by Bedwas Navigation Colliery Company. March 5th.

**Swanage.**—A proposal to adopt public electric lighting has been referred to the Finance Committee.

**Walthamstow.**—Twelve months' supply of cables, jointing materials, electrical fittings, arc-lamp carbons, meters, lamps, &c., for Electricity and Tramways Department. February 28th. Clerk to Council.

**Warrington.**—Twelve months' supply of motors and transformers. Borough Electrical Engineer. March 5th.

**Wimbledon.**—Twelve months' supply of cables, transformers, meters, incandescent lamps, arc lamps, &c. Borough Electrical Engineer. March 5th.

## TENDERS RECEIVED AND ACCEPTED

**Aberdeen.**—Tenders by the Oerlikon Co. and Messrs Bruce Peebles and Co. for new generating plant have been accepted at £11,000, the lowest tenders received.

**Harrogate.**—The tender of the British Thomson-Houston Co. for a 1,250-kw. horizontal turbo-alternator has been accepted at £4,279.

**London: L.C.C.**—The tender of the A.E.G. Electric Co. has been accepted at £902 for electric lighting extensions at the Camberwell School of Arts.

The tender of Messrs. Tredegar and Co. has been accepted at £434 for the electric lighting of the Vauxhall Street School.

**Salford.**—The tender of Messrs. Mather and Platt for filtration plant at the Electricity Works, at £635, has been accepted.

The Shanghai branch of the General Electric Co. received orders during a fortnight in November last for 13,000 Osram lamps from cotton mills alone. An order for 1,000 Osram lamps has also been placed by the Shanghai Tramways.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith & Sons, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £68 to £69 (last week £74 to £76).

**Siemens Brothers Dynamo Works, Ltd.**—Mr. H. S. Kennedy, who has been with the firm for a number of years, has been appointed manager of the Marine Department and will be stationed at Glasgow.

**Nalder Bros. & Thompson, Ltd.**—Messrs. Berry, Skinner and Co. (Oozells Street, Birmingham) have been appointed representatives of this firm in the Midland district, and will hold a stock of instruments.

**Ferranti, Ltd.**, held their third annual dinner at the Midland Hotel, Manchester, on February 14th last. Two hundred members were present, and, having duly dined, some of their number provided an excellent musical entertainment.

**Bankruptcy.**—Mr. C. S. Northcote, Electrical Engineer, 67 Stanthorpe Road, Streatham, S.W., has been adjudicated a bankrupt. The public examination will be held at the Court House, Wandsworth, on February 27th, at 10.30 a.m.

**Liquidation.**—The Gilbert Arc Lamp Co. is being wound up for the purpose of completing the transfer of the assets of the

Company to Engineering and Arc Lamps, Ltd., Sphere Engineering Works, St. Albans.

**Electrical Installations, Ltd.**—Some sixty members of the staff of this firm held their annual dinner at "The Horns," Kennington, on the 15th inst., Mr. Stanley C. Russ being in the chair. After the dinner some of them entertained the company with an excellent variety programme.

## APPOINTMENTS AND PERSONAL NOTES

Mr. Fred Riley, who, we recently announced, had been appointed Electrical Engineer to the Todmorden Corporation, has decided not to take up the appointment. The vacancy has been offered to Mr. J. Boyce, of Darwen, who was next on the list of applicants. It is understood that Mr. Riley has been offered inducements to remain at Rawtenstall.

Mr. W. E. Mandelick, Secretary of the Underground Railways Co. of London, will take over the secretarial duties of the City & South London Railway Co. and the Central London Railway Co. as the result of the amalgamation scheme, Mr. W. F. Knight and Mr. E. Moss, Secretaries of the prospective Companies, resigning.

Mr. J. G. Steele, Station Superintendent at West Hartlepool, has resigned owing to ill-health.

Mr. C. Mittelhausen, who recently resigned the position of Borough Electrical Engineer and Tramways Manager at Bexley through ill-health, has been presented with a pair of binoculars and a clock by members of the various departments of the Corporation.

Electrical fitters for H.M. Dockyard, Portsmouth, are required. (See advertisement on another page.)

## COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**Dividends of London Supplies Companies.**—Chelsea Electricity Supply Co., final dividend, making 5 per cent. for 1912, placing £13,626 to depreciation and carrying forward £2,832.—Central Electric Supply Co., 5 per cent.—Notting Hill Electric Lighting Co., 5s. per share.—Kensington and Knightsbridge Electric Lighting Co., 9 per cent.—City of London Electric Lighting Co., 8 per cent.

**The Institution of Electrical Engineers.**—The following is the result of the ballot, at the meeting on Thursday, of new members and members' transfer:—*Members:* H. N. Baker, F. Bhering, W. W. Blunt. *Associate Members:* H. E. Annett, C. L. Arnold, F. H. Barnett, W. S. Barter, F. C. Baumann, R. G. Beer, J. Bemrose, J. C. Bentley, L. F. Bickell, W. T. Bottomley, H. Brown, J. E. Brown, A. H. Cheeseman, L. O. Cox, H. B. Fisk, H. W. Franks, B. J. Grigsby, D. A. Hackett, W. G. Hardy, C. S. Jeffrey, W. Kidd, G. H. Langdon, W. J. Lee, S. Lees, G. B. Lincolne, J. K. MacDougall, E. Moxon, E. D. ## SUMMARY

A SYSTEM of public lighting with 50-c.p. metal filament lamps hung a few feet from the kerb at some considerable height from the road has been adopted at Southgate. (Page 113.)

AT a recent meeting of the Yorkshire Local Section of the Institution of Electrical Engineers, a lecture on internal combustion engines was given by Mr. K. Cox. (Page 116.)

THE questions of the most economical number of generating stations, tariffs, management, and advertising were dealt with in a Paper by Mr. G. W. P. Page before the Students' Section of the Institution

of Electrical Engineers at recent meetings. (Page 116.)

THE new 8,000-kw. turbo-generators for which the London County Council are inviting tenders are to run at 1,500 r.p.m., and a steam consumption of 12.75 lb. of steam is to be guaranteed with a penalty over and a bonus under. (Page 117.)

THE London Electric Supply Corporation is appealing in the House of Lords in a case relating to the way in which the Westminster Electric Supply Corporation is managing the London Company's business in the Westminster area, which it is doing under an agreement between the two companies. (Page 117.)

MR. H. M. SAYERS writes referring to Messrs. J. G. & R. G. Cunliffe's recent Paper on tramway feeders, and calls attention to earlier work done on the subject. (Page 117.)

FITTINGS for bringing conduits round girders, a semi-indirect lighting fitting, and the application of indirect lighting to picture theatres are dealt with in short illustrated articles. (Page 118.)

THE construction of a wireless telegraph receiving station is dealt with in our "Questions and Answers" columns. (Page 119.)

A SYSTEM of signalling over land lines connected to long submarine cables without retransmission has been devised by Mr. J. Gott, engineer to the Commercial Cable Co.—Marconi's Wireless Telegraph Co. has expressed its determination not to continue with the Imperial wireless scheme unless the contract is confirmed by March 1st, but the Postmaster-General has threatened to enforce his rights.—Several wireless installations are to be erected by the Mersey Docks and Harbour Board.—We also give a description of the equipment of the new wireless station at Fort Myer (Vancouver), where it is estimated that a potential of 150,000 volts is obtained at the top of the antenna. (Page 120.)

WE describe the new L.C.C. trailer cars, the interesting feature of which is the braking arrangements.—The Postmaster-General proposes to construct tube electric railways for the transportation of mails in London.—It is proposed to abandon the proposed tramway near St. Paul's Cathedral. (Page 121.)

THE decision of the Comptroller-General of Patents regarding the application by the B.T.-H. Co. to amend the important specification No. 21,513/06, relating to wire-drawing for metal filament lamps, has been announced. Some of the proposed alterations have been allowed, but the opposition was on the whole successful. Opposition to the grant of a patent to C. E. Wills for number-plate indicators has been entered. A patent granted to B. Brukwicki for an electro-magnetic gear was published last Thursday. (Page 122.)

THE scheme by which the Brush Co. was to be supplied in bulk from the Loughborough Corporation Works has fallen through.—Judgment has been re-

served in the libel action by the Aberdeen City Electrical Engineer against the local branch of the Electrical Contractors' Association.—There is considerable controversy in Leicester as to street lighting.—The two Newcastle Supply Companies have become partners in an electrical showroom. (Page 123.)

EXTENSIONS are contemplated at Finchley (£15,000); Loughborough (£10,000); and Bingley (£5,500).—Mains and services are required at Woolwich, Bedford, Leek and Grimsby.—An electric lighting installation is required in Lucknow, and a further extension of time is announced with regard to the L.C.C. new turbo-generators.—Prospective buyers from Australia and South Africa are now in London.—A year's supply of electrical goods is required at West Ham, Edinburgh and elsewhere. (Page 123.)

THERE was a deficit of £4,593 on last year's working of Messrs. Bruce, Peebles & Co.—W. T. Henley's Telegraph Works pay a dividend of 15 per cent., and the British Electric Transformer Co. 10 per cent. (Page 124.)

### ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, FEBRUARY 27TH.

*Tramways and Light Railways Association.*

7.30 for 7.45 p.m. Annual dinner and smoking concert, Trocadero.

*Institution of Electrical Engineers.*

8 p.m. Fourth Kelvin Lecture: "The Ohm, the Ampere, the Volt: a Memory of Fifty Years Before, 1862-1912," by Dr. R. T. Glazebrook.

FRIDAY, FEBRUARY 28TH.

*Physical Society.*

5 p.m. At King's College, Strand. The agenda includes "Alternating Current Magnets," by Prof. E. Wilson.

*Institution of Electrical Engineers: Manchester Section.*

7 for 7.15 p.m. Annual dinner at Midland Hotel.

SATURDAY, MARCH 1ST.

*Association of Mining Electrical Engineers.*

5.30 p.m. Warwickshire and S. Staffs. Branch. "Cables for Shafts of Mines," by E. K. Scott.

MONDAY, MARCH 3RD.

*The Batti Wallahs.*

8 p.m. Annual General Meeting at Golden Cross Hotel, Charing Cross.

TUESDAY, MARCH 4TH.

*Institution of Electrical Engineers: Manchester Students' Section.*

7.30 p.m. At Municipal School of Technology. "Practical Testing of Transformers," by W. Parry.

*Institution of Civil Engineers.*

8 p.m. At Institution of Mechanical Engineers. "Notes on City Passenger-Transportation in the United States," by G. D. Snyder.

*Institution of Electrical Engineers: Glasgow Students' Section.*

8 p.m. At Royal Technical College. "Illumination," by N. McCaskill.

WEDNESDAY, MARCH 5TH.

*Institution of Electrical Engineers: Students' Section.*

7.45 p.m. "Electrical Heating and Cooking Apparatus," by S. M. Hills.

THURSDAY, MARCH 6TH.

*Institution of Electrical Engineers.*

8 p.m. "Recent Developments in the Street Lighting of Manchester," by S. L. Pearce and H. A. Ratcliff.

### The London Electrical Engineers.

(TO-DAY) THURSDAY, FEBRUARY 27TH. C. Company.—Recruit Training, 7 to 10 p.m.; Company Training, 7 to 10 p.m.

SATURDAY, MARCH 1ST. C. and D. Companies (Left Half Battalion).—Week-end Training at Dover. Service Dress. No Arms. Parade at Victoria Station, L.C. & S.E. Line at 1 p.m. Headquarters open for Regimental business from 10 a.m. till 12 noon.

MONDAY, MARCH 3RD. A. Company.—Recruit Training, 7 to 10 p.m. Company Training, 7 to 10 p.m.

TUESDAY, MARCH 4TH. B. Company.—Company Training, 7 to 10 p.m.

THURSDAY, MARCH 6TH. C. Company.—Recruit Training, 7 to 10 p.m. Company Training, 7 to 10 p.m.

FRIDAY, MARCH 7TH. D. Company.—Company Training, 7 to 10 p.m.

SATURDAY, MARCH 8TH. Headquarters open from 10 a.m. till 12 noon.

**Manchester Electro-Harmonic Society.**—A most successful concert was held last Friday, and over 300 persons were present. The programme consisted of classical music for strings and pianoforte interspersed with high-class songs. The chair was taken by Mr. W. Cramp in the absence of Mr. Pearce. The next concert will be on March 25th, with Mr. F. S. Sells in the chair, and will be the last of the season.

**The Electrical Trades Benevolent Institution.**—A report has been drawn up by the secretary and laid before the committee on the bearing of the National Insurance Act on the Institution. The working of the Act is recapitulated, and it is pointed out that the benefits are in general too small to meet the requirements of the average person employed on the staff of an electrical concern, and how desirable it is that they should be supplemented by those afforded by the Institution.

**JOBMASTER** (to Supply Representative, who has advised him to put in a chaff-cutter motor at £4 per B.H.P. per annum, plus ½d. per unit). Don't talk to me about a pound a quarter to run a brake-horse! Why, he don't cost a quid a year!

## STREET LIGHTING AT SOUTHGATE

A SYSTEM of electric public lighting, which has much in the Southgate Urban District along the whole of the portion of the thoroughfare known as Green Lanes, lying in that district. This forms part of the extensive area to the north of London which is supplied by the North Metropolitan Electric Power Supply Co., in response to whose invitation we were present on the occasion of an inspection of the new lighting by representatives of various local authorities in the North Metropolitan area on Wednesday night of last week. The party were first of all entertained by the Company at their sub-station at Winchmore Hill, where they were welcomed by Mr. J. Devonshire (Managing Director), and other officials of the Company. Mr. E. T. Ruthven Murray (Engineer-in-Chief) in a short speech explained the main features of the new lighting, and how it is supplied, and several of the gentlemen present representing other districts expressed their appreciation of the system that had been adopted. A tour of inspection was afterwards made in special tramcars, enabling comparisons to be made with the other systems of street lighting employed by neighbouring local authorities.

The new street lamps, although suspended in the manner described hereafter from the span wires of the Metropolitan Electric Tramways, are supplied independently of the tramway supply from the ordinary distributing mains through the various sub-stations of the North Metropolitan Electric Power Supply Co. The Winchmore Hill sub-station, where the party assembled, is connected to the 11,000 volt, three phase, 50 cycle ring main system supplied from the company's stations at Willesden and Brimsdown, and is looped in between the latter and the Wood Green sub-station, so that supply can be obtained from either direction. The pressure is reduced by Berry transformers provided with voltage regulator, to 8,000 volts, at which pressure energy is sent out to sub-stations, from which distribution is effected at 240 volts, three phase, four wire, for lighting and general purposes, and at 415 volts, three phase, for large motors. The high-tension cables for the tramway supply are also looped in to this sub-station to form a switching point, but no transformation is done.

The principle feature of the method of street lighting employed is the hanging of single metal filament lamps of moderate size from the tramway span wires, in suitable fittings, at a considerable height over the roadway, a few feet from the kerb line. The system was first used at Barrow, and is therefore generally known as the Barrow system, and is due largely to the enterprise of the Wardle Engineering Co. (196 Deansgate, Manchester), who designed and supplied the necessary fittings, &c. The general arrangement is shown in the figure (in which one of the experimental gas lamps which competed unsuccessfully with the system is also seen). The leads are brought up the posts on one side and a clock switch fitted to base of the post is used to switch on and off, so that each pair of lamps is controlled independently. Alternate posts are connected to different phases of the three-phase, four-wire system, so that the load is equally balanced. The fittings are most successful from the point of view of appearance.

The method of suspension is as follows. A 7/16 galvanized steel suspension wire is fixed across the road between each pair of poles, and from this are suspended two fittings, each fitting being fixed 18 ft. 6 in. from the centre of the roadway. The fittings are 6 ft. 8 in. in length over all, and bring the lamp to a height of approximately 17 ft. 6 in. from the road level. The stems of the fittings are passed through reel insulators, which are attached to the span wire by means of "V" binders, thus preventing them from swinging, while leaving them free to move vertically. The fittings are also fixed to the suspension wire by means of a "V" binder, so that the erection of a fitting is quite an easy matter, and only occupies a few minutes.

The lanterns employed are 18 in. "Beatark" fittings, with specially designed white enamelled reflectors, giving very uniform distribution of light. With the exception of one or two lamps of one hundred candle-power fixed at the junctions of important roads, each lamp is of 50 c.p. With a view to securing complete immunity from faults, "Cab Tyre" sheathed cable has been used for the wiring of the fittings to the cut-outs.

In addition to the equality of the illumination and absence of dazzling bright spots, an important feature of the system is the almost total absence of shadows on the carriage way

in this respect, an improvement both upon centrally hung lamps or those supported over the kerb. Again, the lamps are not in the direct line of vision of either pedestrians or drivers, and the absence of glare enables objects on the roadway to be clearly seen at a remarkable distance. The system is relatively inexpensive when compared with certain others employing arc lamps, and where, as in this example, the lamps are suspended from supports attached to the tramway standards carrying overhead conductors, no additional poles are required. The method of suspension employed entirely overcomes any trouble which might otherwise be experienced with metal lamps due to the vibration of passing tramcars, gales, &c. This is borne out by the fact

ELECTRIC LAMP HUNG FROM SPAN WIRE (WITH COMPETING GAS LAMP WHICH WAS AFTERWARDS REMOVED).

that in one installation in an exposed North Coast town the average life of the lamps is considerably over 2,000 hours. We might add that this system has also been installed with success at West Ham, Barrow-in-Furness, Rawtenstall, Chester, and Penang.

In conclusion we wish to express our appreciation of the courtesy of the North Metropolitan Electric Power Supply Co., as well as our thanks to the Wardle Engineering Co. for putting illustrations and technical particulars at our disposal.

**London and Electricity Supply.**—In February, 1912, the London County Council appointed a Special Committee to consider and report as to the best means of placing London in the most advantageous position in regard to electricity supply, taking into account the fact that the Council has now powers to purchase all the London electric supply undertakings. This Committee has at last reported, but no recommendation is made. It appears that 16 meetings have been held, and that consideration has been given to a large number of matters connected with the supply of electricity in London. It is pointed out in the report now made that no expert advice has been taken, and in the circumstances it is not thought that any useful purpose would be served by the submission of a detailed report upon the work which has been done by the Committee. The opinion, however, is expressed that a committee should again be constituted to carry on the inquiry.

## The Lamp

## THE Reflectors

VELURIA.

MAZDALUX.

MAZDALUX.  
Angle Type.

# Open Letter

MAZDA HOUSE  
77, UPPER THAMES STREET,  
LONDON E C

Gentlemen,

We want you to feel that the Mazda lamp service is a part of your organisation - ready to assist you all the time.

Here's one way we can help you at once.

There are any number of people in your district whose places of business are not properly lighted.

We can show you how to change these places over to improved lighting - and bring you increased business, not only in Mazda lamps, but in reflectors, fittings etc. as well.

We will provide you with the materials for good lighting, in simple standard form.

Here they are :-

### MAZDA DRAWN WIRE LAMPS

Standardized in correct sizes and filament position for use in scientific reflectors  
Supplied in sizes from 10 watts up and for all commercial voltages.

### SCIENTIFIC REFLECTORS - All standardized to give definite lighting results.

VELURIA - the glass without glitter, most attractive type of efficient reflector available.

HOLOPHANE - prismatic glass of scientific design.

MAZDALUX - metal reflectors in 8 shapes for different distributions Without equal for industrial service.

- 1 -

# Mazda LAMPS

# Contractors.

- 2 -

## SCIENTIFIC DESIGNS OF FITTINGS.

### MAZDALIERS

The fittings that are standardized and which make business easy for you. They come to you in neat cardboard cartons, - already wired with necessary galleries and holders. Ready for fixing in a few minutes. Made for 1, 2, 3, 4 or 5 lights. In round or square tube - two finishes. All packed in cartons with everything necessary.

These standard materials, installed by the simple rules we give you, enable you to ensure good lighting results (without calculations) for the general run of interiors.

We provide Illuminating Experts who are freely at your command to work for and with you

- to lay out complete lighting schemes
- to assist you to make demonstrations
- to convince your customers of the benefits of better light.

Our Advertising Department will help to tell your public how you can serve them,

- by giving you copy and blocks for advertisements in local papers
- by supplies for mail distribution of attractive booklets, postcards, blotters etc.
- by attractive showcards.
- by interesting displays for your show windows

All this service is free to you and freely offered - we welcome your co-operation. Why not make full use of Mazda service and sell two or three lamps where you now sell one - to say nothing of the other materials: and the satisfaction of your customers.

Write us to-day.

Yours faithfully,

THE BRITISH THOMSON-HOUSTON CO., LTD.

## The Fittings

THE MAZDALIER  
is in

A Neat Carton

and is quickly ready  
for fixing.

THE TUNGSTOLIER.

Various designs of arms, bodies, shells and canopies, enables contractors to shew a variety of distinct fittings without carrying a large stock.

# Mazda SERVICE.

## INTERNAL COMBUSTION ENGINES

A LECTURE was given on this subject by Mr. K. Cox on January 29th before a meeting of the Yorkshire Section of the Institution of Electrical Engineers. The author thought that where a new plant had to be erected, and more especially where coal was expensive and the load fairly steady, the internal combustion engine had many points in its favour. The Diesel engine station will cost somewhat more than the steam station; but although the Diesel engine is a comparatively expensive piece of machinery it is complete in itself, its only accessories being a circulating water pump and fuel tanks. Taking a 600 kw. station (suitable for a moderate-sized works) he estimated the capital costs (including building) as follows: Turbo-generators, £8,850; gas plant with producers, £9,640; and Diesel engine plant, £11,080. The corresponding running costs he put at £52, £48 10s., and £60 7s. per week respectively for an average load of 600 kw. for 60 hours per week. This works out at 0.348d., 0.292d., and 0.447d. per kw.-hour. Owing to the low price of coal, the number of stations where Diesel engines show to the best advantage is not so great in this country as in many instances abroad. In Germany, also, considerably more use is made of by-products. In comparing large and small units, the lecturer gave the following arguments in favour of the use of small engines, except in very large installations. The thermal efficiency of a moderate-sized unit is not less than that of a large unit. The risk of failure of vital parts in large engines is greater than in small ones. The capital cost and space occupied by a number of smaller units is little more than that of a large unit. A number of units give a much more elastic station and a greater factor of reliability. He enlarged upon some of the difficulties in the construction of large engines, especially as regards water-cooling, and described various types in use, favouring on the whole the vertical tandem multi-cylinder 4-stroke pattern. The various forms in which the Diesel engine is built were mentioned, and with regard to fuel he said that the present high price of residual oil was due to lack of transport facilities. There were at present approximately 100 tank steamers being built. When these were put into commission this fuel would fall to a reasonable cost; but at the present time there was not the plant in this country to put on the market sufficient distillates from coal tar to augment the residual oil and to keep fuel oil at a reasonable figure.

Mr. H. W. Ravenshaw, in opening the discussion, referred to the compactness and convenience and economy of Diesel engines. He did not think there was much chance of oil fuel coming down in price again, but it must be remembered that all other fuels had gone up too. He referred, however, to the poor overload capacity of gas and Diesel engines, and their bad mechanical efficiency and excessive wear due to high piston ring pressure when heavily loaded. Mr. Smith preferred the gas engine working from a bituminous pressure producer to the Diesel engine at the present prices of fuel, except for the Colonies and abroad, where they had oil fuel available locally, and spoke of such plants producing current at 0.1d. per unit for a 24-hour load. Practically the whole of the cost of the fuel could sometimes be wiped out by the revenue obtained from bye-products. He paid high tribute to the reliability of both gas and Diesel engines. Mr. Weardale had not so high an opinion of the immunity of the Diesel engine from breakdown. Many internal combustion-engine troubles were, however, really due to putting in engines too small for the work they had to do. On the whole he preferred the horizontal to the vertical design. Mr. H. E. Yerbury (Chief Electrical Engineer, Sheffield Tramways) thought that there were possibilities in the gas-engine driven on town gas for extensions to municipal supply stations where space was limited, and suggested that cheaper rates should be charged for gas in bulk for the purpose. Mr. Boulden spoke of some hopeful experiments as to the production of liquid fuel from soft deposits of coal which were not being worked. Mr. Naylor criticised some of the author's capital costs. Mr. Cox, in his reply, attributed certain Diesel breakdowns to too small clearances, and cleared up a number of points of detail raised in the discussion.

**Boycott of German Electrical Goods in Prague.**—Following on the unwarranted boycott of German motors and apparatus by the Electrical Supply Undertakings of Prague (see ELECTRICAL ENGINEERING, January 23rd, page 52), these companies have issued a further circular to the effect that before installation of the home-manufactured plant is permitted, the motors and other apparatus must be subjected to a test by the supply authority. Exorbitant fees are demanded, ranging from 25 kronen for a small squirrel-cage motor to 175 kronen for a 100-h.p. slip-ring motor.

## ELECTRICITY SUPPLY POLICY

UNDER this title Mr. G. W. P. Page read a Paper before the Students' Section of the Institution of Electrical Engineers on February 19th. In consequence of the many controversial points raised, and the large number of speakers, the discussion was adjourned until yesterday evening, February 26th. The chair was taken by Mr. A. H. Scabrook (Engineer and Manager, Marylebone Electricity Supply).

Mr. Page first considers the most economical number of generating stations to supply present and future requirements. A reduction to about one-half of those now in existence is advocated, the size of the station depending on the district, but no station having a large radius of action. The author does not think that any very great saving would result from much standardisation of pressures and frequencies when all factors are taken into account. Apparatus should be hired to consumers, or else sold outright and bought back at a price determined on a suitable scale. To popularise electricity for all domestic purposes, the author favours a "sliding-scale flat-rate." He considered that 6d. per unit for the first 5 units per 25 c.p. metal filament lamp installed per annum, 2d. for the next 5, and all further units at 1d., would prove remunerative to most undertakings, and would encourage consumers to take up electric heating and cooking, as no further initial charge would have to be met. On the question of ownership the author believes that company management under moderate Central Government supervision is the most satisfactory. Advertising, he thinks, should be carried out jointly by the supply company, and the contractors from joint local showrooms by means of well-written unbiased literature, technical representatives, and lectures. One of the best advertisements would be large electric restaurants in provincial towns.

The tone of the ensuing discussions was in general in favour of flat-rate charging, with abolition of meter rents. Standardisation of pressures and frequencies was generally regarded as being of great benefit. Municipal supply found several supporters, though full wiring and fittings powers were regarded as being necessary for success. Much diversity of opinion was expressed as to the most economical number of stations. Owing to the great capital cost of transmission lines, however, the policy outlined above was generally favoured. Diesel engine stations for small towns found adherents. Mr. E. F. Hetherington (North Metropolitan Power Distribution Co.) referred to the difficulties in linking up systems of different frequencies, and advocated intermediate conversion to continuous current. The author replied at length to the points raised, and substantiated his previous remarks.

**Osram Fancy Costumes.**—The General Electric Co. have sent us some illustrations of ingenious fancy dresses that have been made up with the aid of Osram lamps and Osram advertising literature. Several of these provided by the Publicity Department of the company have been successful in winning prizes for their wearers.

**Annual Dinner of the Yorkshire Local Section of the Institution of Electrical Engineers.**—The dinner was held at the Hotel Metropole, Leeds, on February 21st. Mr. Wilson Hartnell, the chairman, presided, and the visitors included Mr. W. Duddell (President), Mr. J. F. C. Snell, Mr. Robert Hammond, Mr. A. G. Lupton (Pro-Chancellor of the University, Leeds), Mr. J. E. Kingsbury, Alderman R. A. Smithson, and Mr. E. Kitson Clarke. Mr. Lupton, in proposing the toast of the "Institution," said that he looked upon the Institution as a descendant of the spirit of the ancient trade guilds in that it fostered the growth of the electrical industry. Mr. Duddell assured them that the Institution had awakened to the needs of its members. The Local Sections were a valuable aid to the parent body in keeping them in touch with the country members. They enabled Papers to be discussed in various centres, and thereby increased the value of the journal, which was intended to be a clear exposition of the latest improvements in electrical science. Mr. R. Hammond, in proposing the "Yorkshire Local Section," mentioned that it had a membership of 246 out of a total of 7,300 for the whole Institution, and pointed out that out of the twelve stations with the lowest generating costs four stood to the credit of Yorkshire. The Chairman referred to the progress of electrical science since 1880, and urged members to assist the secretary by more freely offering practical papers, thereby giving members the benefit of their practical experience. In proposing the toast of the "Electrical Industries," Alderman R. A. Smithson wished them to understand that in taking the course he recently did with regard to the proposed large scheme of extensions to the Leeds electrical undertaking he had no wish to postpone developments, but rather to establish it, if possible, on a firmer basis. Leeds was a pioneer in the introduction of railless traction, and he considered there were great developments in store for this form of locomotion. Mr. J. E. Kingsbury and Mr. W. B. Woodhouse also spoke. During the evening, on behalf of the Local Section, the Chairman presented Mr. H. Dickinson with a set of silver candlesticks as a token of its appreciation of his late services as hon. secretary.

## TURBO-GENERATORS FOR THE L.C.C. GREENWICH POWER HOUSE

IN accordance with the decision referred to on page 689 of *ELECTRICAL ENGINEERING* of December 12th last, the London County Council is now inviting tenders for two turbo-generators of 8,000 kw. normal capacity, and several features in the specification are somewhat novel, and may be of interest.

Tenders will be considered for any well-known type of turbine, whether of the reaction, impulse, or combined types, provided that it complies with certain conditions. Notwithstanding the large size of the plant, the Council's advisers have decided to adopt a speed of 1,500 r.p.m., the highest possible for their periodicity of 25 cycles per second, and we believe this will be the first example of turbines of this size manufactured in England for so high a speed. Several machines have been made in Germany for the same speed, and for an output of 16,000 k.v.a., whilst in America several machines are now under construction for 1,500 r.p.m., with an output of 20,000 k.v.a., but these are for a higher periodicity, and are four pole. The advantages in adopting so high a speed are two-fold. First, the initial expense is very much reduced, and, secondly, with most types of turbines a very considerable increase in steam economy is obtained. The first turbines purchased for the Greenwich station were arranged for a speed of 750 r.p.m., and at the time they were purchased extreme steam economy was not considered of so much importance as reliability in running. Since then much progress has been made in the manufacture of steam turbines, and with few exceptions modern designs of turbines may be considered as thoroughly reliable in working, and consequently in the present turbines high steam economy is the predominant feature of the specification. The steam pressure is 180 lb. per sq. in., superheated to a temperature of 550° F., and with ample condensing water from the Thames, a 95 per cent. vacuum is anticipated.

Under these conditions, Mr. Fell has fixed upon a consumption per kilowatt hour of 12.75 lb. of steam, and should this be improved upon a bonus of £500 per 1/10th of a lb. of steam will be awarded, and if, on the contrary, the figure of 12.75 is not realised, a corresponding penalty will be imposed, whilst the Council reserves the right entirely to reject the plant on a consumption exceeding 13.5 lb. of steam. Included with the tender are centrifugal circulating pumps, air and extraction pumps, and these are specified to be driven by auxiliary steam turbines, which, again, appears to be an innovation on previous practice adopted at the station. We understand that this modification is dictated by the need of an independent method of driving the plant, should a shut-down of the electric supply unfortunately occur, and the change is also dictated by motives of economy, as the latent heat of the exhaust steam from the auxiliary turbines will be utilised in the hot-wells. As is well known, the temperature of the water from high vacuum condensers is only in the neighbourhood of from 70°-80° F., whilst a temperature of from 95°-100° is necessary before water can safely pass through the economiser to avoid sweating of the tubes.

The electrical side of the specification does not appear to show many novel features, as only general conditions are laid down, and it is left for each particular manufacturer to offer his own design of plant. The machines are to be wound for the full pressure of 6,600 volts, step-up transformers not being employed, and the stator coils are specified to be mica insulated throughout. The result of high speed of rotation is a very small machine carcass, consequently the problem of getting rid of the heat will be a serious one, and ample ventilation spaces with a large amount of ventilating air are essential. We notice one novel feature in dealing with this air whereby the ordinary cloth filter is dispensed with, and air washing is substituted. This has the effect not only of thoroughly cleansing the air of all impurities without the inconvenience of renewing the filter cloths, but what is of more importance, it thoroughly cools the incoming air before it enters the generator. A similar device is already in operation at the Brighton Electricity Works, and we understand that Mr. Christie, who is responsible for its adoption, is highly satisfied with the result. With a view to keeping down the short circuit current, the regulation of electrical pressure cannot be arranged within very close limits, and to overcome this difficulty a Tirrill regulator is proposed.

The financial effect of the superior steam economy of the turbines over the reciprocating engines which they are to replace is anticipated to amount to a saving of some £15,000 per annum at the present price of coal.

## DISPUTE BETWEEN SUPPLY COMPANIES

THE London Electric Supply Corporation's appeal to the House of Lords, relative to the agreement with the Westminster Electric Supply Corporation is now proceeding. The agreement in question provides for the management of the London Company's undertaking within part of the Westminster Company's area, by the Westminster Company. This agreement was entered into in pursuance of the London Electric Supply Act, 1908, and particulars were given in *ELECTRICAL ENGINEERING*, Vol. V., Oct. 21st, 1909, p. 919. The London Company supplies alternating current, and the Westminster Company direct current. Certain annual sums are paid to the London Company by the Westminster Company, together with 0.85d. per unit for all energy used. The London Company find that instead of their business in the area in question becoming larger or even remaining stationary, it has decreased considerably. It is alleged that the Westminster Company have been refusing to supply prospective consumers with alternating current, and have also offered inducements to existing consumers on the London Company's mains to change over to direct current, which is only supplied by the Westminster Company. The case was taken through all the Lower Courts, the verdict in each being that since in effect the Westminster Company had purchased, so far as the law would allow, the Westminster portion of the London Company's business, and that in the absence of any specific clauses in the agreement to the effect that they were not to induce the London Company's consumers to change over, they had not broken the agreement. Mr. Danckwerts, K.C., and Mr. Buckmaster, K.C., are appearing for the London Company in the present instance, while Sir Robert Finlay, K.C., and Mr. Younger, K.C., are appearing for the Westminster Company. The appellants contend that since the Act of 1908 does not sanction the sale of a part of one company's undertaking to another, the Lower Courts were all in error in their judgments. The relation of the Westminster Company to the London Company under the agreement was only that of agent or manager to principal or owner, so that in treating all applications for power to the London Company as coming to themselves, and in offering inducements to users of direct current, they were acting *ultra vires*. By their action they may, it is alleged, render the London Company liable to prosecution for non-fulfilment of its statutory obligations to the consumer, as well as rendering the whole of the business less remunerative than it should be. The Westminster Company are maintaining that they are only adopting ordinary business methods.

## CORRESPONDENCE

### FEEDERS FOR TRAMWAYS.

To the Editor of *ELECTRICAL ENGINEERING*.

SIR,—The abstract of Messrs. Cunliffe's Paper on feeding networks for tramways and the discussions thereon, published on page 10 of *ELECTRICAL ENGINEERING* of January 2nd, do not indicate that the authors made any reference to earlier work on the same subject. This may be due to abbreviation, and I note that Mr. Yerbury, in his communication to the discussions, mentioned Papers read in 1898, presumably those of Mr. H. F. Parshall and Mr. Trotter, both read in April, 1898. Mr. Parshall showed the commercial uselessness of unboosted track feeders, and Mr. Trotter explained a neat, graphical method of ascertaining rail drop under given data of service track conductivity, &c. In May, 1900, I read a Paper on "Distributing Systems of Electric Traction," in which, *inter alia*, I showed by general formulæ and application to a particular case methods of calculating track feeding points, track feeders, and booster capacities, for maximum economy. Also trolley feeders. The principles then laid down were applied in various tramways, of which I designed the electrical equipment for the B.E.T. Co. between 1898 and 1903, and in other cases where I advised or designed.

Allowing for certain changes in conditions, such as the Board of Trade restriction of current density in rails to 9 amperes per square inch not then in force; the increase in magnitude of the general supply business in the great cities, where both that and the tramway undertakings are in municipal hands, I think it will be found that Messrs. Cunliffe's conclusions support those of their predecessors of 1898 and 1900.

There is one paragraph in my own Paper which I would commend to the engineers of the tramways of large British cities, containing a suggestion never yet put into practice—to my knowledge—but which might solve or alleviate some of their difficulties, including, perhaps, corrugation. I transcribe it: "It seems, however, that a modification in track construction, using continuous girder supports under the rails, and dispensing with concrete and setts between them, should be a logical consequence of electrical traction; and that the conductivity of the track might be thus largely increased, and bonding made much more permanent without much increase in construction costs. The difficulty now experienced at the joints of tram rails should disappear, and the life of the road be greatly increased."

I am, yours truly,  
Caixa 4, Santos, Brazil.  
January 30th, 1913.

HENRY M. SATERS.

## GIRDER CONDUIT CLIPS AND BOXES

**SIMPLEX CONDUITS**, Ltd. (116 Charing Cross Road, S.W.C.), have designed the form of box which we illustrate here with the object of reducing installation costs where it is found necessary to pass the conduits frequently round girders. It avoids considerable trouble in fitting short lengths of tube, and provides a neat arrangement for carrying conduits round girders in factories and so on. Where it is required to drop a light from the girder, the box can be

SIMPLEX GIRDER BOX.

provided with a porcelain connection piece and a cord grip. The box itself is practically equivalent in cost to the two inspection bends which in the ordinary case would be used. Another novelty is a clip for attaching conduits to girders where the run of the tube is at right angles to the girder. These clips are made in two pieces, held together and tightened, so as to grip the tube, by a substantial brass bolt and nut. A tongue-shaped projection engages the flange of the girder. The labour required to fix these clips is almost negligible, and they can be fixed very rapidly.

## INDIRECT LIGHTING IN A PICTURE THEATRE

**THE** British Thomson-Houston Co., Ltd. (Mazda House, Upper Thames Street, E.C.), has sent us a description of a recently opened cinematograph theatre in Lime Street, Liverpool, which is the first house of its kind to adopt the company's now well-known "eye-rest" system of indirect lighting. This system, in which the lamps are mounted in bowls containing inverted reflectors, is particularly suitable

INDIRECT LIGHTING OF VESTIBULE.

for picture theatres, as it eliminates the necessity for completely darkening the auditorium.

The main auditorium is lighted by four fittings, with 36 in. decorated plaster bowls, placed symmetrically around the centre dome. Two of these fittings contain four, and the other two, three, 200 watt Mazda lamps in suitable mirror reflectors. These fittings are supplemented by six small fittings under the cornice, three on either side, each containing one 100 watt Mazda lamp. Seven small fittings similarly equipped, are fixed under the gallery balcony, and

the balcony itself is lighted by three other small fittings. All these fittings were specially designed to harmonise with the decorative scheme of the auditorium. With all the lamps alight, a minimum illumination intensity of  $1\frac{1}{2}$  foot candles is given in the well of the auditorium, and  $2\frac{1}{2}$  foot candles in the balcony. At the end of each interval the large centre fittings are switched out entirely, but the small fittings are kept on during the performance, and have a dimmer in circuit which allows of a gradual adjustment of the light, so as to give a subdued illumination over the whole auditorium, which does not interfere with the screen effects but is of sufficient intensity for the perusal of programmes, and to enable the audience to find their way to their seats. The four large fittings around the auditorium dome are suspended by lowering gear, so that they can be easily cleaned and repaired from the floor. This gear also provides the necessary electrical connection between the fitting and the controlling circuits, and at the same time ensures a positive mechanical support for the fitting, independent of the lowering cable. The lighting of the vestibule, of which an illustration is given, is particularly effective, and is effected by a single decorative plaster bowl fitting suspended from the centre of the dome.

The whole of the installation work was carried out by Messrs. R. F. Winder, of Leeds, to a specification prepared by the architects, Messrs. Chadwick & Watson, of Crown Chambers, Albion Street, Leeds, on the basis of an illumination scheme designed by the Illuminating Engineers' Department of the British Thomson-Houston Co., Ltd., by whom the Mazda lamps and fittings were supplied.

## A CHEAP AND EFFECTIVE SEMI-INDIRECT LIGHTING FITTING

**THE** illustration below shows a simple and effective fitting made by the Wardle Engineering Co., Ltd. (196 Deansgate, Manchester), which, in spite of its extremely low price—7s. 6d.—is neat and even elegant in appearance. The bowl is made of thin opal glass, its diameter is 11 ins. ;

the diameter of the reflector is 12 ins. Three small brass chains about 4 ins. long, ending in simple clips, are used to suspend the bowl from the reflector. The fitting of this size is suitable for any size of lamp up to 100 c.p., either with pear-shaped or spherical bulb.

**Conduit Wiring.**—A paper on this subject was read by Mr. F. H. Taylor at a recent meeting of the Junior Institution of Engineers. The author referred to the disadvantages of "slip" conduit as regards difficulty in bending, risk of getting loose and causing the pipe to hang on the wires, difficulty of earthing, and impossibility of making a waterproof job. The Institution wiring rules only allowed its use to a limited extent in dry places, but the Phoenix Fire Office unreservedly prohibited it. It was particularly bad when buried in plaster. Of screwed conduits, solid drawn seamless tube was preferable to either brazed or welded material, owing to its better bending qualities and freedom from internal burrs or roughness. The trouble from condensation was not as great as had been made out, provided some care was taken as to the situation of the tubes; a pipe left with an open end for ventilation was sometimes desirable. Good enamel inside the tube was of more value than outside, but galvanising, in the author's opinion, gave better protection than enamelling. The points that made for efficiency were:—straight runs, avoidance of elbows and tees, liberal use of boxes for drawing through, ample size of tube, and metal bushing pieces to all ends of tube. The all-iron system, with iron-clad distribution boards, &c., had much to recommend it. The author emphasised the importance of good earthing by good clips, which make as much contact as possible with as much of the circumference of the pipe as possible, and earth wires of ample size. Isolating the electrical pipework from other conducting material was equally necessary. Rules as to the testing of the earth connections were badly wanted.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelopes.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,328.

A 72 b.h.p. motor, 570 r.p.m., is developing this h.p. and transmitting a proportion through 1:6 ratio spur gear, 92 per cent. efficiency; second reduction, worm-gear triple thread, 1:30 ratio, 70 per cent. efficiency; third reduction, 1:6 ratio spur gear, 90 per cent. efficiency. The efficiencies stated are at full load. What are the losses in the gear when motor is developing 10 b.h.p. at same speed?—W. A. C.

(Replies must be received not later than first post, March 6th.)

### ANSWERS TO No. 1,326.

It is required to erect a simple wireless receiving apparatus for experimental work, and some information on the following points is requested:—(1) What apparatus is necessary for enabling messages to be received up to about 500 miles? (2) The approximate length of aerial wires necessary, and whether it matters whether these are run vertically or at a sharp angle to the ground? (3) Can a suitable coherer be made by an amateur? If so, give particulars. (4) Is a telephone receiver sufficiently sensitive to be connected directly across the coherer without any other instrument, to enable messages to be received? Assuming that this apparatus is fixed on a hill some 600 ft. above sea-level, will it be too high for satisfactory working?—WIRE.

The first award (10s.) is made to L. D. Hill for the following reply:—

(1) The essential apparatus to receive from 500 miles is as follows:—Aerial, at least 90 ft. between poles; double-slide tuning inductance, detector, blocking condenser, and telephones (Fig. 3).

**Aerial.**—This will require about 300 to 400 ft. of No. 16 or 18 copper wire, and should consist of two wires in parallel to one another, suspended between insulators, on spreaders at least 5 ft. long. The aerial should be suspended from two poles, or other high objects, between 35 to 50 ft. from ground. The leading-in wires should be soldered to the middle of the span on each wire, and brought together just outside the instrument room (Figs. 1 and 2). The aerial should be as far as possible from large conducting surfaces such as buildings, and as high above ground as possible; also the portion suspended between the poles should be as nearly horizontal as possible. It does not matter much at what angle the aerial is with respect to earth, providing the lowest point is at least 30 ft. above ground (see answer to 2).

**Double-slide Tuning Inductance.**—Wind about 400 to 500 turns of No. 24 S.W.G. enamelled wire on a cardboard cylinder 5-6 ins. in diameter and 12 to 15 ins. long. Scrape two narrow strips of insulation off parallel to axis of coil to enable two sliding contacts to make contact with any turn of wire. These contacts must be so arranged that they can pass one another (see diagram Fig. 3).

**Blocking Condenser.** consists of four sheets of tin foil 2 by 4 ins. separated by waxed paper, 3 by 5 ins. Fix flexible connections to sheets, roll these up while warm from pressing, and place in an ebonite tube  $4\frac{1}{2}$  ins. long,  $\frac{3}{4}$  in. inside diameter, fix flexible leads to terminals, then fill up ends with black accumulator wax.

(2) A vertical aerial could be used, but is not nearly so efficient or effective as that described. It should be carried on a pole at least 100 ft. high in order to receive from distances of

500 miles. An umbrella aerial might be used, but, unless it is impossible to erect the aerial described, its use is not advised.

(3) **Detector.**—A "coherer" is unsuitable for long-distance receiving. Use a crystal detector. Any of the following combinations are good:—Copper pyrites and zincite; bornite and zincite; silicon and brass; platinum or gold point, galena and graphite.

Fig. 4 shows a simple detector, easily made. The detecting

FIG. 1.

FIG. 2.

element should be fixed in cups with Wood's metal, a low melting solder. The elements recommended are copper pyrites and zincite. Fused silicon in the lower cups and a point of brass in place of top cup is also good. No battery is necessary with either of these sets. Bornite may be substituted for copper pyrites.

(4) **Telephones** are used for detecting the minute currents rectified by the crystals, and should be specially wound for the purpose. Each circuit should be wound with copper wire to a resistance of at least 1,000 ohms. I should advise you to pur-

FIG. 3.

FIG. 4.

chase a first-class set. The better results amply repay the expense.

(5) No, certainly not; in fact, it is a distinct advantage to be as high as possible.

Signals have been obtained with such apparatus as described from distances over 700 miles, and wave lengths up to 4,500 metres.

**Further Points.**—A good earth connection is very important. Connect to water main, also to metal plates, let in moist ground vertically providing good surface. In spite of what has been said to the contrary by others, see that aerial is very well insulated, remembering that surface distance is required. High-frequency discharges travel on the surface and not through conducting objects, therefore insulators must have ample surface. Solder all joints and have as few as possible. Any guys to pole should have an insulator between pole and earth or fixing.

The second award (5s.) is made to P. R. Coursey, who writes as follows:—

Receiving apparatus for an experimental wireless station may take a variety of forms, depending partly on the particular type or system chosen, but more generally on the capacity of the owner's purse, and his opportunities for constructing or obtaining the various parts.

(1) A full description of everything necessary for receiving purposes cannot be given in the space available, but a general scheme may be laid out, using the following pieces of apparatus:—(a) An aerial tuning coil ( $L_1$ , see Fig. 5); (b) a variable coupling jigger,  $J$ ; (c) a variable tuning condenser,  $C_1$ , in the aerial circuit; (d) a variable tuning condenser,  $C_2$ , in the detector circuit; (e) a detector  $D$  and headpiece telephones  $T$ .

The diagram shows the method of connecting them up,  $A$  representing the aerial and  $E$  the earth lead. This earth connection may be made to a water main (care being taken to secure a good connection to a main supply pipe, and not merely to a tap or pipe leading from a cistern), or to an earth plate of considerable area, buried in damp soil in much the same way as for a

lightning conductor.  $Sw_1$  is the main aerial switch, and serves to throw over the aerial to the receiving apparatus or directly to earth when not in use, to prevent damage by lightning discharges. Good insulation must be secured in this, and also in the other switches used ( $Sw_2$ ,  $Sw_3$ ,  $Sw_4$ ), by mounting them on well insulating bases, such as ebonite, and keeping the contacts sufficiently far apart. In connection with details of construction, several of the well-known text-books on wireless telegraphy might be consulted with advantage, while some useful hints for amateur apparatus may be obtained from a book by "Alfred," entitled "Hints for Wireless Designs for Amateurs"; but the following details may be found suitable for the case in hand. For the tuning coil  $L_1$ , 300 turns of No. 28 S.W.G., bare copper wire, are wound 10 turns per centimetre on an ebonite rod 2.5 cms. diameter, with a slider to vary the number of turns in circuit. For the jigger primary  $L_2$ , 80 turns No. 30 S.W.G., s.s.c., copper wire are wound as a single-layer flat coil, starting at an inside diameter of 2 cms., and ending at an outside diameter of 10 cms., with wires brought out at 10, 25, 50, and 80 turns from the outside to the switch  $Sw_2$ , and arranged so that the 10 turns are in circuit when the switch is on contact (1); 25 on contact (2), &c. The secondary  $L_3$  may be wound in the same way, with the line to contact (1) of switch  $Sw_4$  brought out at 30 turns from the outside. Variable condensers  $C_1$  and  $C_2$  may be made of semicircular sheets of zinc mounted

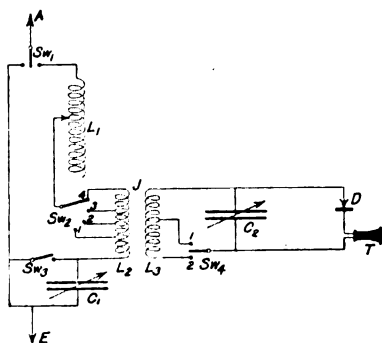

FIG. 5.

so that alternate sheets may be rotated more or less in between the fixed sheets, as in the manner usually employed in variable air condensers. It would be more satisfactory to purchase these than to attempt to construct them. The maximum capacity required in each is about 0.001 mfd. The telephone  $T$  should be a double headpiece telephone receiver wound to a resistance of at least 2,000 ohms.  $D$  may be any ordinary contact or crystal detector, such as a plumbago point lightly resting on a galena crystal.

(2) It would not be much use attempting to receive messages from stations up to 500 miles away without an aerial at least 60 ft. high. The wires should not run at a sharp angle to the ground, but be kept as far as possible vertical, although a more or less horizontal portion at the top, having a length about equal to the vertical portion, giving an aerial of the inverted L type, would be an improvement.

(3) Coherers can be made by amateurs possessed of considerable skill in glass blowing, but would not be of any use (whether amateur-made or otherwise) for a 500-mile range. Only a crystal detector, such as mentioned above, would be of much use, unless a Fleming oscillation valve is invested in.

(4) A phone receiver is of little use with a coherer, not because it is too insensitive (far from it), but because it does not provide for any decohering arrangement. The telephone should be used as above with a crystal detector. It will not be a disadvantage to erect the aerial on the top of a hill, provided that a good earth connection can be obtained.

## CATALOGUES, PAMPHLETS, &c., RECEIVED

**CONTROLLERS.**—A sheet from George Ellison (Victoria Works, Warstone Lane, Birmingham) illustrates some new drum type controllers for cranes, hoists, &c. We note that all wearing parts are liberally designed, while ample space is allowed for connecting up. Other features which may be mentioned are the accessibility for inspection and the ease with which the controllers may be dismantled for cleaning and repairs. Other illustrations show compact and rigid resistance units.

**PIPE WORK.**—A booklet, forming a comprehensive catalogue of flanged pipes and accessories, is to hand from Aiton and Co. (Derby). A quantity of most useful engineering information is given, by means of which engineers can decide the sizes of pipes which will be required for any duty, and can work out their cost, including the necessary accessories. There are full tables of dimensions and prices of pipes, and of the flow of steam and water in them, and a standard specification is given.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

Mr. John Gott, the Commercial Cable Co.'s Engineer, has devised a system of signalling on submarine cables, which has for its object the avoidance of re-transmission and the elimination of the syphon recorder. Instead of the impulses for the dots and dashes of the Morse code being a series of "positive" currents divided by short periods of earthing, the impulses sent are alternately positive and negative. The wiping out of the charge in the cable is thereby facilitated. To reverse the direction of current at each successive depression of the key, an electrical and not a mechanical device is employed. The ordinary discharge current on releasing the key passes through a relay, the tongue of which connects the charging contact of the key to one or other side of the battery. At the far end of the cable or line, a moving coil relay is employed, the right-hand and left-hand contacts of which are connected together so that the impulses are once more made unidirectional. This represents the general principle of the arrangement in its simplest possible form, but of course in practice there are other auxiliary devices, and the connections are more complicated. In using the system it is expected that it will be possible to connect the cables and land lines straight through and thus to avoid re-transmission, and of course there will be the great advantage, whether the messages are relayed or not at the cable ends, that they will be received in true Morse. We understand from Mr. Gott that the method has already been tried with success on a long cable, but that its permanent employment by the Commercial Cable Co. is likely to be delayed for a few months.

The equipment of the new wireless station at Fort Myer, Arlington, Vancouver, is described in a recent issue of the *Electrical World* (New York). In addition to the information given in *ELECTRICAL ENGINEERING*, Vol. VIII., Dec. 19th, 1912, p. 711, we may say that three-phase 25-cycle current at 6,600 volts is purchased from a local company and stepped down to 220 volts for driving a 200-h.p. synchronous motor at 500 r.p.m. This motor drives a 220-volt 500-cycle alternator at 1,250 r.p.m. The pressure is stepped up to 25,000 volts. The revolving spark-gap consists of a 4-ft. wheel with fifty terminals (one per pole in generator), and gives 1,000 discharges per second. The pole spokes are  $\frac{1}{4}$ -in. copper, 8 ins. long. The minimum spark-gap is  $\frac{1}{4}$  in., but the air breaks down 3 in. ahead and behind the small-gap discharge. For safety, 12-in. wooden beams surround the wheel. The condensers, each of 0.036 mfd. capacity, are used in parallel. They are made up of steel plates set in steel cylinders and air-insulated at 300 lb. per sq. in. The signalling contacts are manipulated through relays, shunted on the low-pressure side by a resistance of about 220 ohms. The earth wires terminate in 60,000 ft. of bare copper wire laid in trenches between the towers. The sending wires connecting with the aeriels are led out through a heavily insulated window-pane, 1 in. thick, to the distributing pole, where the wires from the generator, controlled by the sending key, terminate, also the line to the detector, and a third wire which is well earthed. The transmitting and detector wires are extra-insulated from their wire supports by composition strain insulators, and from the posts by large double-petticoat porcelain insulators. The terminals of these three wires form the contacts of a three-point switch, controlled from the operating room by a system of chains and pulleys. A double-throw, single-pole switch is placed in the detector side of the line. With this switch arrangement it is evident that the operator can at will close the circuit for receiving messages, change over for sending, or earth the entire system, as in time of storms. The connections between aeriels are made by "cages" containing twenty-three phosphor-bronze wires soldered to the bridles of the spreaders. The wires between the 600-ft. main tower and two 450-ft. towers are about 400 ft. in length, and those between the two smaller towers 300 ft. Forty feet is allowed in each span for sag. From needle-point tests, which showed a spark-length of 11 in., it has been estimated that a potential of 150,000 volts is obtained at the top of the antenna.

In answer to the Postmaster-General's second refusal to free Marconi's Wireless Telegraph Co. from the terms of the contract for an Imperial wireless telegraph scheme, the Company has now informed the Postmaster-General that unless the contract is confirmed by March 1st, they will no

# ADAMS IGRANIC

ELECTRICAL CONTROL GEAR FOR LIFTS, HOISTS AND CRANES.

ADAMS  
M<sup>C</sup>C<sup>9</sup>L<sup>7</sup>  
BEDFORD  
AND  
LONDON

longer consider themselves bound by it. The Postmaster-General, however, has since intimated that he will enforce his rights in the matter.

The Mersey Docks and Harbour Board have decided to enter into arrangements with the Board of Trade, and the Post Office, for the establishment of several wireless telegraph stations on their lightships, and also one at the Dock Office.

European telegrams for Mexico in commercial codes were again accepted on the 18th inst.—On the following day the El Arich route was repaired, but failed again beyond Adana, and the Indo-European Telegraph Co. notified the failure of their cable between Odessa and Constantinople. The Saint Jacques-Doson cable was restored.—On the 20th inst., the Teheran-Meshed line was restored, and the delay and censorship of Mexican telegrams ceased.—The African Direct Cable Co. announced on the 21st inst. that work on their cable between Bonny and Duala was suspended, and on the 22nd inst. the El Arich route was restored.—The Teheran-Meshed line was not working again on the 23rd, but was repaired on the 24th inst.—The c.s. *Mackay Bennett* was in Halifax, N.S., on January 8th, and left for repairs on the 17th of that month.—The c.s. *Minia* returned from repairs on the 23rd ult. The c.s. *Relay* sailed from Halifax, N.S., on January 24th to repair the French cable off St. Pierre.—We learn that the German Cable Works are making a considerable quantity of cable for the Central and South American Cable Co., and that London boats have been chartered to take out cable.

## ELECTRIC TRACTION NOTES

In pursuance of powers conferred upon it by Parliament, the London County Council has decided to proceed with the equipment of a number of trailer cars for service, in the first place, in the Woolwich district. Horse car bodies, suitably converted, are being employed for the first batch, equipped with certain standard fittings, such as route indicators and wired for electric lighting, and these are being mounted upon light strong underframes of standard rolled steel sections, extended to support the platforms. The underframe is carried by laminated springs upon standard electric car axles in ball bearings which move in horn guides secured directly to the underframe. The automatic brake gear is of a novel character, and has been designed with the primary object of securing the safety of the trailer in the event of the coupling breaking while travelling on an up-grade. It comprises a set of inside hung brake blocks normally forced on to the wheels by a pair of compression springs carried directly between the two brake beams. The draw-bar is extensible, and slides through a frame mounted underneath the platform. To the end of the draw-bar is secured a chain anchored to a cast-iron drum keyed to a rotatable shaft upon which is also mounted a smaller chain drum, this latter drum carrying a double purchase chain connected to a sway bar in the centre of the car, which, when rotated through a small arc of a circle, serves to draw the two brake beams together by means of an equalising chain and release the brake blocks from the wheels. Thus, when the tractor car exerts a pull upon the draw-bar of the trailer, the shaft carrying the chain drums is rotated, and actuates the brake block releasing sway-bar to free the blocks from the wheels. The gear is duplicated at the two ends of the car. In order to enable the car to be backed, a brake release is provided, comprising a socketted quadrant, into which a lever may be fitted through a slot in the platform. The insertion of the lever into the socket and its movement in a direction towards the car body serves to rotate the chain drum shaft and release the blocks. In order to avoid the possibility of the trailer starting with the brake released, the shape of the slot has been so arranged that the lever can only be withdrawn when the releasing quadrant is in the "off" position, and the lever is placed so as to obstruct the entrance to the car. The whole of the brake gear is carried upon a light sub-truck independently of the underframe. Each draw-bar is provided with a single

draught and buffing spring, and the car is, in addition, provided with spring fenders at the ends, which come into action before the buffer springs are finally compressed. The auxiliary connections between the tractor and trailer comprise a leather bell cord, a jumper cable for the lighting circuit, and a pair of telescopic gates protecting the gap between the two cars. The whole of the connections are arranged so as to be quickly disconnected. The whole of the work of design and construction of the trailer cars now practically ready for service has been carried out in the Tramways Department, to whom we are indebted for the above information.

The Highways Committee of the L.C.C. recommend that the proposed tramway subway, which was intended to be built in connection with the new St. Paul's Bridge, should be abandoned. The reason for this is the danger to the foundations of St. Paul's Cathedral, which is apprehended would follow the construction of such a subway.

The proposed scheme for the construction of an extensive system of underground tube electric railways connecting various parts of London for the transport of mails by the Post Office, is now taking more definite shape, and the Postmaster General has given notice of application for the necessary Parliamentary powers. The scheme includes the construction of a line from the Mount Pleasant general sorting office to Paddington Station, one to the Eastern District Post Office, Stepney, and a line from St. Martin's-le-Grand to Mount Pleasant. The railways will be worked electrically, but apparently energy will be obtained mainly from outside sources, as power is to be applied for to enter into agreements for bulk supply for the purpose. Although the routes, levels, &c., are decided upon, particulars are not yet available as to the diameter of the tunnel, the nature of the rolling stock to be employed, nor the system of control to be adopted, and it is believed that various alternative arrangements are under consideration.

Some years ago a concession was granted for the construction of an electric mountain railway from Brigue to Riederalp and on to the Märjensee. According to the *Gazette de Lausanne*, the necessary capital has not been found, and an alternative scheme is being considered for a line starting from Fiesch, in which the Jungfrau Railway Co. is interested.

At a special general meeting of the Central London Railway Co. last week, the scheme of the Company's Bill now before Parliament was discussed and approved. The proposal is in respect of a line from Shepherd's Bush to Gunnersbury, where it will link up with the London and South-Western Railway. The Parliamentary estimate is £759,072, and it is proposed to raise £750,000 new capital with the usual one-third borrowing powers. The Central London Railway will, if this extension of 2½ miles is completed, be a direct link between the Great Eastern in the east, and the Great Western and South-Western in the west.

The question of the electrification of the North London Railway was raised at the annual meeting last week, but any action of this kind is dependent upon the general scheme now under consideration by the London and North-Western Railway Company.

Under the Metropolitan Electric Tramways (Railless Traction) Bill, which authorises the Metropolitan Electric Tramways, Ltd., to link up their tramways with the Walthamstow tramways by means of trolley omnibuses, general powers are given to the Board of Trade to sanction other new routes without the necessity for an application to Parliament. This provision, which has been inserted previously in Municipal Bills granting trolley omnibus powers, is being taken exception to by a number of Local Authorities, who fear that unless it is amended in some way, the Tramways Co. may at some later date secure powers for running in their districts.

**Osram Lamp Patents.**—On Friday, February 7th, in the High Court of Justice, Chancery Division, Mr. Justice Swinfen Eady granted an interim injunction to the Osram Lamp Works, Ltd., restraining the Oro Light & General Supply Co., Ltd. ("Oro" Lamps), their servants, agents, and workmen, from selling lamps infringing Osram Patents Nos. 23,899 of 1904 and 18,622 of 1906. The lamps in question were made by the Wolfram Co., Augsburg, Bavaria.

# "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

## Specifications Published Feb. 20, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

2,437/12. **Signalling on and Stopping Trains.** A. MINNICK. The construction and arrangement of apparatus for the system in which the track is provided with conductors and the train with electrical apparatus which becomes operative when one train is in proximity to another. A time switch on the train is normally closed, and after the circuit has been automatically opened, closes it after a given time. Twenty-one figures.

2,522/12. **Water Heater.** M. H. SCHOENBERG. In the heating chamber, which has metal inlet and outlet, are the heating coils. A short-circuiting plate is fixed to the casing and connects the metal parts, thereby avoiding possibility of shock. A lock plate interrupts the circuit when the water supply is cut off. The elements are replaceable by unskilled labour. Five figures.

4,458/12. **Reversing Gear.** B. BRUKWICKI. The mechanically connected armatures of two synchronous machines have a common short-circuited winding in which is induced, by two entirely separate magnetic fields, constantly rotating synchronously by means of a commutator, E.M.F.'s, the resultant action being to rotate backwards or forwards a magnet core on the driven shaft generating one of these magnetic fields. Close regulation is obtained by varying the excitation of one core. Two figures.

29,636/12. **Series Petrol-Electric System.** H. PIEPER. A separately excited motor drives each axle. All are in series. The pressure across each is kept uniform. For two motors a low-resistance auto-transformer is connected to the dynamo armature by slip rings. Its mid-point is connected to the common motor terminal, or two commutators may be used.

## Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communications of inventions from abroad. Summaries of some of the more important of these patents will appear in our next issue.

**Arc Lamps:** CROMPTON'S and CROMPTON, 3,397/12; B.T.-H. (*G.E. Co., U.S.A.*) [Electrodes] 13,988/12.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** TAYLOR [Charging and discharging storage cells] 2,630/12; CLARKSON and MORISON [Automobile lighting] 4,716/12; YATES [Connecting conduits, &c.] 6,146/12.

**Dynamos and Motors:** PETERSEN [Electrostatic alternators] 2,442/12; BROWN, BOVERI [Self-excited D.C.] 2,734/12.

**Electrometallurgy and Electrochemistry:** SANITAS-OZONE [Generating and diffusing ozone] 2,779/12; ELEK. INDUSTRIE [Tube welding] 3,634/12; TISCHENKO [Manufacture of sheet iron by electrolysis] 8,668/12; PAULING [Reaction furnaces] 21,478/12.

**Heating and Cooking:** DIXON [Cigar lighters] 8,677/12; SCHAEFFER [Hot-air douches] 20,191/12.

**Ignition:** RIESZ [Spark plugs] 8,206/12; CHEVANCE [Distributors] 14,624/12.

**Incandescent Lamps:** B.T.-H. (*G.E. Co., U.S.A.*) 2,468/12; BEUTTELL and MANNERS-SMITH, 3,099/12; STILLMAN, 4,783/12; DU MOULIN [Repair] 12,784/12; FARKAS [Wire drawing] 14,654/12.

**Instruments and Meters:** WORLIZKA and SLUZAR [Instrument alarm] 2,517/12; FERRANTI [Meters] 3,412/12.

**Switchgear, Fuses, and Fittings:** DORMAN, SMITH and BAGGS [Fuse] 10,409/12; RAILING and GARRARD [Combined switches and plugs] 14,785/12; MILNE [Switches] 16,065/12; PERRY [Lighting brackets and pendants] 16,119/12.

**Telephony and Telegraphy:** SIEMENS BROS. & Co. (*Siemens & Halske*) [Automatic and semi-automatic telephony] 2,671/12, 2,672/12, and 2,743/12; [Semi-automatic exchange key panel] 13,415/12; LENCH [Insulator bracket for poles] 10,600/12.

**Traction:** WOOD [Trolley head] 3,146/12; SIEMENS BROS. DYNAMO WORKS and LYDALL [Safety apparatus for electric trains] 6,922/12; PIEPER [Electro-mechanical transmission] 7,153/12, 13,235/12; ROTTENBERG and NEW TRANSPORT CO. [Preventing collisions on self-propelled systems] 11,196/12.

**Miscellaneous:** SUNDBERG [Purifying copper] 4,692/12; SIEMENS BROS. DYNAMO WORKS (*Siemens-Schuckert*) [Punching discs, &c.] 11,319/12; SIEMENS & HALSKE [Electro-medical electrodes] 13,416/12; RUBEL [Manufacture of dynamo iron] 15,532/12; DAVIDSON [Portable centrifugal fans] 22,049/12.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Distribution Systems, &c.:** OKUN [Lighting] 2,125/13.

**Dynamos and Motors:** BROWN, BOVERI [A.C.] 7,258/12.

**Electrometallurgy and Electrochemistry:** ELLIS [Production of aluminium nitrates] 25,650/12; GITLINI [Ditto] 25,874/12; JUNGNER [Obtaining alkali from mica, &c.] 26,497/12.

**Ignition:** SIEMENS & HALSKE [Spark plugs] 1,064/13.

**Switchgear, Fuses and Fittings:** BERGMANN A.-G. [Electromagnetic heavy current switches with automatic release] 2,778/13.

**Telephony:** BRUCE [Switches for automatic] 1,157/13; KATZ [Selecting] 2,302/13.

**Traction:** SIEMENS-SCHUCKERT [Screw propeller motor control] 2,136/13.

**Miscellaneous:** MUNDEN and MUIR [Announcers] 14,225/12; SCHNYDER [Electromagnetic typewriters] 2,170/13; GALLOWAY [Batteries] 2,402/13.

## Amendments allowed

21,515/06. **Drawn Tungsten Wire Filaments.** B.T.-H. (*G.E. Co., U.S.A.*). The amendments asked for in this specification by the B.T.-H. Co. have been allowed with certain modifications. The proposed amendments to claims 1 and 2, whereby it was sought to substitute the words "hammered, rolled, or drawn" for the words "operated on or manipulated," have not, however, been allowed. Full particulars of the hearing before the Comptroller-General of Patents were given in *ELECTRICAL ENGINEERING*, Vol. VIII., December 19th, 1912, p. 703, as well as the preliminary announcement of the proposed amendments on September 12th, 1912, p. 510.

The following Amended Specification may now be obtained.

**Distributing Systems, &c.:** HENLEY'S and W. F. BISHOP [Cable earthing and bonding] 17,347/11.

## Opposition to Grant of Patents

21,734/11. **Signalling and Advertising.** C. E. WILLS. Opposition has been entered to the grant on this application. Number plate and similar indicators are controlled from a keyboard, the keys of which are connected so that each key controls the illumination of different groups of lamps.

22,406/11. **Elevated Luggage Transporter.** S. ARNOLD. The grant of this patent has been allowed in spite of opposition. The lay-out is arranged for transporting goods and luggage between trains in stations and goods warehouses, &c.

## Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

4,276 of February 27th, 1899. **Automatic Dynamo Pressure Regulators.** N. BROWNE (*Tirrill Automatic Potential Regulator Co., U.S.A.*). Details of the now well-known Tirrill regulator. Reference is made to a prior specification, No. 1,535/89, in which the entire regulating resistance is cut in and out. The present invention is to overcome the tendency of the contact points to stick, and the possibility of accident to the solenoid wires permanently cutting out the regulating resistance. There are seven claims.

4,327 of February 27th, 1899 (Convention date, August 20th, 1898). **Electro-pneumatic Traction Motor Controllers.** G. WESTINGHOUSE. This specification covers the Westinghouse pneumatic system, in which the various valves are controlled electromagnetically. There are 13 claims and 20 figures.

4,801 of March 4th, 1899. **Motor Starter.** J. H. HOLMES and F. BROADBENT. Two movable arms pass over the resistance studs, which are arranged in the usual way. To start the motor, the two arms, being in engagement in the off position, are moved over the studs against the force of a weight or spring, the second arm thereby putting in the resistance. Near the end of the travel the first arm completes the circuit through all the resistance. It is held in this position by overload and no-voltage gear as usual. The second arm then travels slowly back over the resistance studs till the resistance is all out. Its rate of travel is controlled by a dash-pot or other means in conjunction with the spring or weight.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Dynamos, Motors, and Transformers:** A. B. HOBSON [Transmission of armature power: Fans] 24,128/02; L. J. HUNT and SANDYCROFT'S [Short-circuited rotor connections] 23,834/04.

**Electrometallurgy:** A. HJORTH [Induction furnaces] 28,961/06.

**Incandescent Lamps:** B. T.-H. (*G. E. Co., U.S.A.*) [Tungsten or tantalum and a little silicon with the necessary binders are used for high resistance filaments for lamps and heaters] 24,707/07.

**Meters:** M. KALLMANN [Calibrating using resistances with temperature coefficient varying with current] 22,544/05.

**Switchgear, Fuses and Fittings:** B. T.-H. and H. N. SPORNBERG [Contact switchgear for A.C. motor control] 25,203/06; J. H. COLLINGS [Time switch] 24,367/07.

**Telephony and Telegraphy:** F. L. MUIRHEAD [Portable poles] 24,966/06.

**Miscellaneous:** W. E. LAKE (*Electrelle Co., U.S.A.*) [Automatic piano players] 24,501/07.

## LOCAL NOTES

**Aberdeen: Libel Action against Contractors.**—The action by Mr. J. A. Bell, the City Electrical Engineer, against the Honorary Secretary of the Aberdeen Branch of the Electrical Contractors' Association of Scotland, in which £1,000 damages are claimed for alleged libel, was heard in Aberdeen on Wednesday last week, and judgment was reserved. We gave the facts on page 95 of our issue of February 13th.

**Bath: Street Lighting.**—Additions are being made to the street electric lighting. (See "Tenders Invited.")

**Bingley: Electric Supply.**—An agreement for bulk supply for ten years from the Keighley Corporation Electricity Supply Works has been entered into.

**Gromer: Electricity Undertaking.**—The Council have decided to proceed with the transfer of their electricity undertaking to Messrs. Edmundsons' Electricity Corporation.

**Edinburgh: Contractors' Dinner.**—Mr. W. Finlay, who has done so much for the Electrical Contractors' Association in Scotland, was entertained to dinner by the Edinburgh branch last week.

**India: Calcutta Section of I.E.E.**—The newly formed Calcutta Section of the Institution of Electrical Engineers, recently held an inaugural dinner, at which Mr. M. G. Simpson (Electrical Engineer-in-Chief, Indian Government Telegraphs), presided.

**Leicester: Street Lighting.**—Improved street lighting is a matter of some controversy just now, and it is not improbable that the Electricity Department will soon have an opportunity of demonstrating what can be done in the way of modern street electric lighting.

**Liverpool: Electric Supply Accounts.**—The gross profit on the electricity undertaking for 1912 was £169,292, which sum is carried to net revenue account, together with £3,070 interest. After meeting capital charges, and adding £20,000 to renewal fund, the sum of £30,071 is transferred to relief of rates.

**Loughborough: The Electricity Extensions.**—Some months ago an arrangement was made with the Brush Electrical Engineering Co. by which the Corporation were to give a supply in bulk, the Company supplying the necessary plant. In consequence of the delay which has taken place in the negotiations with the Company, the Corporation now finds itself under the necessity of extending the undertaking irrespective of the supply to the Brush Company. The size of the Brush Company's demand was such as to render it more economical to instal alternating current plant, but under the circumstances Mr. J. F. C. Snell, who is advising the Corporation, reports that it is possible to make additions to the present continuous current system in order to cope with the normal increase in the demand. The Corporation have therefore adopted a recommendation by the Electricity Committee that the negotiations with the Brush Co. for bulk supply be postponed, and that Mr. Snell be instructed to prepare a scheme for meeting the general demands on the electricity undertaking next winter.

**Newcastle-on-Tyne: Electrical Showrooms.**—The two Newcastle Supply Companies have jointly established an "electric shop" in Northumberland Street for the purpose of advertising the uses of electricity for all purposes.

**Rhyl: Fixed Price Light.**—The Engineer has been in communication with the Fixed Price Light Co., who, however, state that they are unable to see their way to undertake any work outside the London district.

**Sheffield: Power Exhibition.**—A fuel, light and power Exhibition is to be held in Sheffield in October and November. The Advisory Committee includes Mr. S. E. Fedden, the Manager of the Corporation's electricity undertaking.

**Tasmania: Electric Lighting in Hobart.**—The electric supply installation which has been erected by the Hydro-Electric Co., has been put into operation. The public lighting contract provides for 792 incandescent lamps of 50 c.p. and 75 c.p. and forty 600 c.p. arc lamps. The British Insulated & Helsby Cables, Ltd., have the contract for the poles and cables. The Chief Engineer to the Hydro-Electric Co. is Mr. J. H. Butters, and our readers will recognise in Mr. Ashton Bremner, the assistant engineer, a one-time well-known figure in electric supply circles in this country.

**Wood Green: Electricity Supply.**—There seems every prospect of a strong Parliamentary fight over the installation of electricity supply in Wood Green. The North Metropolitan Electric Power Co. is applying for an electric lighting provisional order for the district, but the Wood Green Council,

who already possess an order, are proposing to transfer it to the Tottenham and Edmonton Gas Co. In addition to these opposing interests, the Tottenham District Council are opposing the Gas Company's Bill which deals with the transfer of the Wood Green Council's order.

**Wrexham: Rateable Value Tariff.**—The Council have approved a revised tariff for private premises on the basis of a fixed charge of 15 per cent. on the net assessment of the house, and  $\frac{1}{4}$ d. per unit for all current used. Householders will be allowed to use current for lighting, heating, and cooking purposes under this tariff.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

[Notes of Contracts Open are not repeated under this heading week by week until the last date for receiving tenders, but are only inserted once.]

## Generating Stations, Sub-Stations, Mains, &amp;c.

**Australia.**—Mr. O. L. Remington (Manager W. McLean and Co., Melbourne) is now in London, at the Hotel Cecil, and desires to get in touch with those who are interested in lines of electrical apparatus or machinery which they are desirous of putting on the Australian market.

The Postmaster-General's Department at Melbourne require Diesel engines and alternators for the high-power radio-telegraph station at Darwin. Tenders by May 14th. Further particulars at 72 Victoria Street, S.W., or 73 Basinghall Street, E.C.

**Bedford.**—In connection with the extension to the street electric lighting, some 3,500 yds. of various sizes of cable will be required.

**Bingley.**—In consequence of the agreement for bulk supply referred to in our "Local Notes" column, a loan of £5,500 for cables, sub-station and machinery, &c., is to be applied for.

**Brighton.**—One 800-ampere-hour storage battery for Southwick power station. March 10th. (See an advertisement on another page.)

**Finchley.**—A loan of £15,000 is to be taken up for extensions to the electricity undertaking.

**Galashiels.**—Further progress is being made with the proposal to erect an electricity generating station, and consultations are being held with certain experts with a view to getting further information. It appears that the chief demands will be for mill-driving purposes, and the probable cost has been put at £30,000.

**Grimsby.**—Loans of £6,000 for mains, and £2,000 for services are to be applied for.

**India.**—The installation of electric supply in Lucknow is being strongly advocated.

**Leek.**—A loan of £2,000 is to be taken up for mains extensions.

**London: L.C.C.**—A further extension of time is announced for the receipt of tenders for two 8,000 kw. turbo-generators. (See an advertisement on another page.)

The following sub-station plant will shortly be required: three rotary-converters at estimated cost of £7,800; transformers and accessories, £4,000; switchgear and cable, £2,200.

**London: Battersea.**—One water-tube boiler, mechanical stoker, &c.; one electric motor-driven centrifugal pump. March 19th. (See an advertisement on another page.)

**Marylebone.**—A loan of £42,000 is to be taken up for extensions at the electricity works.

**Woolwich.**—The London County Council has sanctioned the following loans: mains, £1,500; meters, £630; services, £1,100; hire purchase apparatus, £2,000.

**Loughborough.**—Extensions involving an expenditure of £10,000 are contemplated. (See under "Local Notes.")

**Port Elizabeth.**—Mr. H. J. Holder, the Borough Electrical Engineer, will, says the *British and South African Export Gazette*, arrive in England during March. His Town Council is a prospective purchaser of electrical generating machinery,

FOR  
STEAM JOINTS  
USE

JOHN HUDSON & CO.'S SUCCESSORS, Mansell St., London, E.

and communications may be addressed to Mr. Holder, c.o. Messrs. Davis and Soper, 54 St. Mary Axe, E.C.

**Shaldon (Devon).**—The Teignmouth Council propose to extend electric lighting to this district.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Aberavon.**—New municipal buildings.

**Aberdeen.**—Additions to the Donside Paper Mills.

**Bradford.**—School, Leeds Road. Architects, W. J. Morley and Sons, 269 Swan Arcade.

**Croydon.**—Thirteen houses, Raymead Avenue; C. Banks, Oakfield Road.—Eight houses, Woodside Road; F. R. Lawson.

**Devonport.**—New municipal buildings.

**Edinburgh.**—New public wash-houses at Fountainbridge.

**London: L.C.C.**—About 210 lighting points at Hawley Crescent Elementary School, St. Pancras, N.W. March 12th. Chief Engineer.

**Lewisham.**—The electric lighting of the infirmary has now been definitely passed.

**Manchester.**—Additional wards at Swinton. Poor Law Offices, New Bridge Street.

**Smethwick.**—New school. Secretary of Education, Council House.

**Southend-on-Sea.**—New elementary school.

### Miscellaneous

**Bath.**—In a number of streets gas standards are to be fitted with metal filament lamps.

**Cheshire.**—A twelve months' supply of electrical goods is required for the County Asylum. March 11th. Parkside Committee.

**Edinburgh.**—A twelve months' supply of arc lamp globes and conduits. City Electrical Engineer. March 10th.

**Leith.**—An expenditure of £1,797 upon new electrical pumping machinery is to be incurred.

**Ramsgate.**—The Council have decided to instal a system of electrical fire alarms in the Borough.

**Shanghai.**—According to a recent report by the United States Vice-Consul, the conditions in Shanghai are particularly favourable for the use of electrically-driven vehicles. It is pointed out, however, that any such vehicles should be strong and well made, in order to withstand the climate, which is very damp during most of the year, and hot in the summer.

**West Ham.**—A twelve months' supply of electrical fittings for Guardians. March 13th. Union Road, Leytonstone.

### TENDERS RECEIVED AND ACCEPTED

**Colwyn Bay.**—The following tenders have been accepted: Browett, Lindley-Dick, Kerr generating set, £973; switch-board extension, Bertram Thomas, £125.

**Glasgow.**—The tender of Messrs. Babcock and Wilcox has been accepted for four water-tube boilers for the Port Dundas station at £13,748, and Messrs. Howden and Co. had been given a contract for four boilers for the St. Andrew's Cross Works at £6,910 and another for the supply of turbo-alternators at £17,798.

### APPOINTMENTS AND PERSONAL NOTES

Mr. F. J. Walker, secretary and manager of the St. James' and Pall Mall Electric Light Co., has been appointed managing director.

Between 80 and 90 applications have been received for the post of Electrical Engineer to the Wolverhampton Corporation recently held by Mr. C. E. C. Shawfield.

Mr. W. Lawson, late Manager of the Gas Engine Sales Department of the British Westinghouse Electric and Manufacturing Co., Manager of the Gas Plant and Large Gas Engine Sales Department of Messrs. Crossley Bros., Ltd., Manchester, has recently been appointed Sales Manager of the Power-Gas Corporation, Ltd., Stockton-on-Tees.

A meter inspector is required at Watford Electricity Works. (See an advertisement on another page.)

An electrical engineer is required to take charge of small plant, Alhambra Palace, Morecambe. (See an advertisement on another page.)

Mr. H. C. Babb, of the Dartmouth Electric Light Works, is shortly removing to the Hamilton (N.B.) Electricity Works.

Electrical engineer with experience of automatic telephone exchanges, wanted in London. (See an advertisement on another page.)

Improver wanted in a lighting and tramway station. (See advertisement on another page.)

### MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith and Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £68 to £68 10s. (Last week £68 to £69.)

**Films Illustrating Cable Manufacture.**—The Electrical Co., Ltd. (122-124 Charing Cross Road, W.C.), are prepared to lend to technical societies and institutions a fine set of cinematograph films, prepared by the A.E.G. showing the various processes in the manufacture of electric cables.

**Waygood Concert.**—The 22nd annual concert of the Athletic Association of R. Waygood and Co., Ltd., will be held on Monday next at the Horns Assembly Rooms, Kennington Park, S.E., at 8 p.m.

**G.E.C. Showrooms.**—The General Electric Co., Ltd., have made considerable extensions to their showrooms at 71 Queen Victoria St., E.C., which will be devoted to arc lamps and accessories, motors and other machinery, ventilating and engineering supplies, telephones, electric light supplies, switchgear, &c. A large proportion of the apparatus is wired up and can be seen working.

**Patent for Sale.**—The owner of a patent for dynamo electric machines desires to work same in this country. (See an advertisement on another page.)

**Dissolution of Partnership.**—J. L. Crathorne and F. J. Green, Electrical Engineers, Old Kent Road, S.E., have dissolved partnership. F. J. Green continues.

**Bankruptcy.**—A deficiency of £246 is shown in the bankruptcy of W. Longdon and V. G. Cobb, trading as Longdon and Cobb, electrical engineers, 101a Derby Road, Nottingham.

### COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**Companies Struck Off Register.**—The names of the following will be struck off the register of joint stock companies in three months unless cause is shown to the contrary: Carnarvonshire Electric Traction Syndicate, Ltd.; Empire Electric Light & Power Co.; and the Improved Electric Supplies, Ltd.

**Dividends of Electric Supply Co.'s.**—Charing Cross, West End & City Electricity Supply Co., 5 per cent. for 1912. The carrying forward in the case of both West End & City undertakings is £18,000, after a liberal allowance for reserve.—The London Electric Supply Corporation, 2½ per cent. £250,000 new capital is to be raised to meet the increasing demands of the London, Brighton & South Coast Railway Co.—Newcastle-on-Tyne Electric Supply Co., 5 per cent. on the ordinary shares.

**W. T. Henley's Telegraph Works Co.**—A 15 per cent. dividend is recommended on the ordinary shares for 1912, carrying forward £45,017.

**Yorkshire Electric Power Co.**—At the half-yearly meeting last week it was stated that the sales of current increased during the December half-year by 25 per cent., and under ordinary circumstances there would have been a satisfactory margin of profit, but owing to the coal strike and the fact that one of the large turbines was out of use during a period, there had been such an increase in the works costs as to absorb this extra profit.

**British Electric Transformer Co.**—A dividend of 10 per cent. is to be paid for 1912, carrying forward £4,116.

**Bruce Peebles & Co.**—There is a debit balance of £4,593 for 1913, a result which is largely attributed to labour strikes. The prospects for the current year are, however, better owing to the recent improvement in prices and in the demand for the company's manufactures.

## SUMMARY

IN the fourth Kelvin lecture delivered before the Institution of Electrical Engineers last Thursday, Dr. R. T. Glazebrook traced the history of the evaluation of the units of electrical measurement, in which Lord Kelvin played a prominent part. (Page 127.)

AN interesting meter-reading case was heard in the King's Bench Division this week, in which for 3½ years the final figure on the dial of one of the Electrical Company's meters has been read as a decimal figure instead

of a unit. The supply company are claiming £1,880. (Page 128.)

IN a Paper read before the Association of Mining Electrical Engineers last month, Mr. E. K. Scott contended that unarmoured cables should be permitted in shafts, and advocated the use of aluminium cables. He described various methods of supporting shaft cables, and described a form of casing in which split telegraph poles were utilised. Mr. Scott's views did not meet with general acceptance. (Page 129.)

RECENT progress in electric iron smelting is reviewed in a short article. (Page 131.)

MR. R. NELSON dealt with the growth of electricity for mining operations in a recent paper before the North of England Branch of the Association of Mining Electrical Engineers. The adoption of electricity for all purposes was advocated on economic grounds. (Page 131.)

AMONG the patent specifications relating to mining and metallurgy published during February is one by Messrs. A. and H. Hunte for an electric miner's safety lamp and one by the Sterling Telephone Company covering some improvement to mine-exploders. Several deal with electric furnaces, and one by T. Tischenko for the electrolytic production of sheet iron. (Page 132.)

The design of continuous current brake magnets is dealt with in our Questions and Answers columns. (Page 133.)

A WELL-PROTECTED flexible wire for radiators and a new pattern of electric tailoring iron are described in short articles, and a type of street lamp-post unfamiliar in this country is also illustrated. (Page 134.)

SOME interesting particulars are given with regard to passenger transportation in the United States. On one line the number of passengers carried per annum is increasing as the square of the population. (Page 135.)

SEVERAL automatic and semi-automatic telephone exchanges will shortly be working in France.—Figures are given of the number of wireless telegraph stations in the world, and of the system upon which they work. (Page 135.)

THE Patent Office on Thursday last published, among others, a specification by the B.T.-H. Co. covering the use of certain halogen compounds which are introduced into the bulbs of drawn-wire lamps to prevent blackening. Brown, Boveri & Co. are protecting various designs for field magnets and armatures of D.C. machines to ensure stable working, and Crompton & Co. have a patent for an enclosed flame arc lamp. Further petrol-electric patents have been taken out by H. Pieper. An amendment to an incandescent lamp specification by A. C. Hyde has been allowed under Section 8. (Page 136.)

SOME remarkable figures of saving from the use of electric cooking, &c., are shown at Eton.—The gas engine plant at Accrington is undergoing a three months' trial.—Arrangements have been made for a duplicate supply to Olympia by the Hammersmith and Fulham Councils.—£5,000 are being transferred to relief of rates from electricity profits at Belfast. (Page 187.)

AN electric lighting scheme is being considered at Aylesbury.—Important extensions are to be carried out at Barking, Bispham, Fleetwood, Haslingden, Hastings, Huddersfield, Shipley, and York.—Diesel engines are required in Egypt; transformers and generators by an Indian railway company, and an electric lighting installation for West Africa.—Several municipal electricity departments require annual supplies of stores; additional tramway rolling stock is required at Birmingham, and a steam alternator at Bridgend. (Page 137.)

### ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, MARCH 6TH.

*Institution of Electrical Engineers.*

8 p.m. "Recent Developments in Street Lighting in Manchester," by S. L. Pearce and H. A. Ratcliff.

**Street Lighting at Southgate.**—We are informed by the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), that the lamps in the Southgate street lighting scheme described on page 113 of last week's ELECTRICAL ENGINEERING are all Osram drawn wire lamps. The 100-watt size is used at important road junctions, and the general lighting is carried out by 60-watt lamps. About 210 lamps are used in all.

**Belfast Wiremen.**—We mentioned a few weeks back that the electrical wiremen in the building trades in Belfast had struck for an increase of wages, the idea being to secure £2 per week, which is the wage paid in Belfast to electricians serving in other branches. Last week all the building contractors with one exception granted the increase asked for.

The Lord Mayor of Manchester, in a speech last week, said that he did not believe that the trading departments of a Corporation should allocate large profits in relief of rates. [Last year the Manchester Corporation Electricity Department was made to contribute £24,500 of its profits to relief of rates].

## THE OHM, THE AMPERE, AND THE VOLT

THE fourth "Kelvin" lecture was given by Dr. R. T. Glazebrook, F.R.S. (Director of the National Physical Laboratory), on Thursday last before a crowded meeting of the Institution of Electrical Engineers. The title of the lecture was "The Ohm, the Ampere, the Volt: A Memory of Fifty Years Before (1862-1912)," and the subject was the history of the evaluation of the fundamental electrical units in which Lord Kelvin played so prominent a part.

The lecturer commenced with a few personal reminiscences, describing his first meeting with Sir William Thomson in 1876 at Cambridge in connection with comparisons of E.M.F.'s by the quadrant electrometer, and referred to various subsequent occasions on which they were associated. The development of electrical units was bound up with the history of the British Association Committee on Electrical Standards, and the lecturer took the opportunity of presenting to the Institution a copy of a reprint of this committee's collected reports, which has just been published. He proceeded to sketch in masterly style the life-history of the ohm, the ampere, and the volt, illustrating his remarks by a fine collection of historical apparatus. The B.A. Committee was founded in 1861 at the Manchester meeting of the Association at the suggestion of Sir W. Thomson, and consisted originally of Thomson, Williamson, Wheatstone, W. H. Miller, Fleeming Jenkin, and Matthiessen, but other members were afterwards added. The committee first discussed the most suitable unit of resistance, and decided that it should be based on the absolute C.G.S. electromagnetic unit of Weber, and should be represented by a mercury standard. As many as eleven different "standards," some of very unreliable nature, were in use at that time. The relation of the corresponding units of current and E.M.F. to the absolute units was also defined. Experimental work was taken in hand to determine the value of existing standards in terms of the absolute unit, new determinations were made by Thomson and others, by a method similar to that of Weber, of measuring the deflection of a magnet caused by the action of a rotating coil from 1862 to 1864, and the first B.A. standards of platinum-silver were made. Dr. Glazebrook was able to show his audience some of the actual standard coils and the very rotating coil apparatus used, together with an actual Wheatstone's Bridge used for their comparison. In 1870 the original committee was

dissolved, but further observations began to show that the values adopted were somewhat in error, and it was re-formed at the suggestion of Ayrton in 1880, shortly before the famous Paris Conference, where the names ohm, volt, and ampere were adopted internationally. Lord Rayleigh made new determinations by his improved rotating-coil apparatus, as well as by the Lorenz method. Results in 1884 gave the value 106.02 cm. as the length of the mercury ohm, and in spite of Thomson's endeavours for the recognition of a more accurate figure, the "legal ohm" of a 106 cm. was settled upon in Paris, although it was not adopted in this country. In 1890 a committee, of which Thomson was a member, was appointed by the Board of Trade, and the figure of 106.3 was adopted for the length of the mercury ohm. The lecturer, with the assistance of Mr. F. E. Smith (of the National Physical Laboratory), then showed Lord Rayleigh's rotating-coil apparatus in action, and further explained the Lorenz method, in which a flat disc rotates in a field due to a pair of current-carrying coils, and the E.M.F. produced between the centre and periphery of the disc is balanced against the drop across the resistance to be measured, which carries the same current as the field coils. A further report of the B.A. Committee was submitted to the Edinburgh meeting of 1892, and formed the basis of legislation which led to the foundation of the Board of Trade Standardising Laboratory, where a standard ampere balance was also set up. Passing thus to a consideration of the absolute measurement of current, the lecturer described the original current balance of Weber, and showed some of its coils, together with the current balance and a tangent galvanometer used by Joule in his experiments on the dynamical equivalent of heat. The former was shown in action. The measurement of E.M.F. depended upon the determination of resistance and current. The units were represented originally by their relation to the E.M.F. of a Daniell cell, since superseded by the Clark, and later by the Weston cell. Tracing the course of further experimental work increasing the accuracy of the determination of standards, the lecturer referred to important comparisons made between the current balance and the silver voltameter in 1884, and to the construction of an improved Lorenz apparatus of Viriamu Jones and Ayrton for McGill University in 1897, which gave the value 106.28 for the length of the mercury ohm. In 1902 the National Physical Laboratory was founded, and important

work was reported to the St. Louis Congress of 1904 and the Berlin Conference of 1905. Much work with the current balance at the National Physical Laboratory was recorded in 1907, and finally the last International Conference on Electrical Units and Standards met in London in 1908, where a distinction was made for the first time between the true ohm, ampere, and volt and the international ohm, ampere, and volt. It was recognised that the accuracy with which resistances and currents can be compared is much greater than that with which absolute determinations can be made, and accordingly the values were defined to the former degree of accuracy by the addition of two zeros to the figures obtained to as many places of decimals as could be relied on for absolute determinations. Lord Kelvin, however, did not live to see the units in the development of which he had played so important a part adopted throughout the world. Since the conference, important work has been done in the comparison and co-ordination of the standards of the laboratories of various countries, and figures were shown illustrating the very high degree of accuracy now obtainable. In the meantime, owing to the munificence of the Drapers' Company, a new and much improved Lorenz apparatus has been installed at the National Physical Laboratory, and experiments are in hand by Mr. F. E. Smith which it is hoped will carry the accuracy of the absolute determination of the ohm still further.

At the close of the lecture a vote of thanks was proposed by Mr. Alexander Siemens, and seconded by Prof. Silvanus P. Thompson, to whose remarks Lord Rayleigh also added a few words.

### HOW TO READ A METER

AN interesting, and in some respects remarkable, action was heard on Monday and Tuesday in the King's Bench Division before Mr. Justice Bankes and a special jury, in which the point at issue was the correct way to read the Electrical Co.'s K.G. type of meter. In 1908 the County of London Electric Supply Company installed a meter of this type for registering the power supplied in a factory belonging to Messrs. Salomons and Co., leather dressers, Robson Street, Bermondsey, and for some 3½ years the dial was read by the Company's meter readers on the basis of the last figure representing a decimal instead of a unit. The effect of this was, of course, that the quarterly accounts were exactly one-tenth the value they should have been had the final figure been counted as a unit. When the County of London Electric Supply Co. dis-

covered the error, in 1911, they rendered an account for the remaining 90 per cent. of energy which had been used, the bill for which, for the period in question, amounted to £1,880 5s. 6d.

A considerable number of defences were put into the action, and a counterclaim was actually made for damages on the ground that the consumer, whom, it was alleged, was making a loss on his business, had been misled by the Company's accounts into thinking that the cost of power was much less than it actually was, and that had he known the true cost he would have closed his works at least two years ago, hence the claim for damages to cover the losses incurred during that period. Among the points in the defence were that the meter, being capable of being misread, as the one in question had been, was an unsuitable meter within the meaning of the Company's Provisional Order; that it was not approved by the Board of Trade at the time it was installed, the Board of Trade only having approved this type of meter since the date of installation; that there had been negligence on the part of the Supply Co.'s servants; and that the meter had not been maintained in efficient working order.

The Electrical Co.'s K.G. type of meter, of which Mr. A. J. Cridge said in the witness-box no less than 168,000 have been sold during the past ten years (including 1,000 in this country), has a transverse red line before the final figure on the dial, which the makers say is solely for the purpose of assisting to estimate a fraction of a unit during a test, and that the construction of the meter is such that the whole row of figures on the dial represent units consumed. Eight or nine of the Supply Co.'s meter-readers, however, regarded this line as indicating a decimal point, and Mr. E. E. Sharp, of Messrs. Venner and Co., for the defence, maintained that he would always read such a red line in the same way. On the other hand, it was pointed out that the usual way for the Germans—and the meter in question is of German manufacture—to indicate a decimal point is by a comma, and no meter was mentioned in the defence in which the dial contained a transverse line which the makers intended to be read as a decimal point.

A number of interesting points of common law arose during the hearing of the action, and eventually the judge put six questions to the jury to answer, with the result that they found the meter was a suitable one, that it had been kept in proper order (its accuracy on the basis of the final figure being a unit was not disputed), but that the Company's servants had been negligent in the reading of it. The jury, however, did not think that Messrs. Salomons had been prejudicially affected in the conduct of their business by the rendering of the accounts at one-tenth of their actual value.

This disposed of the case as far as the jury was concerned, but judgment has not yet been entered, as there are several points of law to be decided by the judge, and which will be argued before him later.

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**SWITCHBOARD INSTRUMENTS.**—We have received from Siemens Brothers & Co., Ltd. (Woolwich), a new abridged list of their round pattern switchboard instruments. This includes air-damped electromagnetic ammeters and voltmeters in several sizes for continuous or alternating current, as well as moving-coil instruments for continuous current. A large number of ranges are listed, and the instruments can be obtained with back or front connections. The shunts are built up of groups of manganin tubes with substantial end connections.

**NEWSPAPER PRINTING-PRESS DRIVING.**—A fine new booklet has just been issued by J. H. Holmes and Co. (Newcastle-on-Tyne). It sets forth the details of the widely-used Holmes-Clatworthy system of rotary web printing-press drive with hand or push-button control. The entire equipment bears the stamp of solidity and reliability, and facilities are provided for carrying out with the greatest ease every requirement essential to the rapid production of printed matter. By means of a special button it may be made impossible for the press to be started, so that there is no danger to men engaged in inspection or repair. Should the push-button system give any trouble, the controller may be immediately worked by hand. For smaller presses, where first cost is the greatest consideration, the "Castle" (single motor) system may be employed. Speed regulation is effected entirely by field regulation. We note that nearly 400 newspaper offices and printing works have been equipped during the last few years, the equipment varying from ¼ b.h.p. to 1,500 b.h.p.

**VENTILATION.**—A new pamphlet from Ozonair, Ltd. (96 Victoria Street, S.W.), describes the Ozonair system of pure-air ventilation in detail, and explains fully the principles on which it is founded. The apparatus is illustrated in various forms suited to different conditions, and a list of some important Ozonair installations is given. The pamphlet contains a great deal of information which should be of use to contractors and others interested in ventilation who are not yet familiar with the system.

# ELECTRICAL ENGINEERING IN THE MINING AND METAL INDUSTRIES

## SHAFT CABLES

A PAPER on this subject was read before the London Section of the Association of Mining Electrical Engineers by Mr. E. Kilburn Scott last month, and also has been discussed at the other branches of the Association. Mr. Scott suggested that all the metal work which is continuous from top to bottom of the shaft should be utilised as an earth return. He said that there was nothing in the Home Office Rules against this being done, and, in fact, he said that there was nothing in them to say that shaft cables should be armoured. This latter statement was, however, controverted by Mr. Robert Nelson, H.M. Electrical Inspector of Mines, in the discussion. Mr. Scott's suggestion was that even if it were not convenient to use the existing metal work, it would be cheaper to suspend old wire ropes in the shaft for the earth return than to place the same amount of metal round a cable as armour. He contended that the danger of injury to cables in shafts was far less than to those in the underground roads, &c. With regard to armoured cables, the author also called attention to the rule that the conductance of the armouring must be 50 per cent. of that of the conductor itself. When the thickness of the insulation is small compared with the diameter of the copper, as is the case with low-tension cable, this rule, he pointed out, would call for heavier armouring than that specified by the Engineering Standards Committee. In discussing the shape of the conductors for three-core cables, Mr. Scott said that for low voltages, sector-shaped conductors were considerably cheaper than circular ones, but that after 3,000-volts pressure was reached, the circular section was as cheap, as the saving in total diameter by the sector-shaped conductors became less owing to the thicker insulation, and provision had also to be made for the greater electrical stress at the corner of the sectors.

The next subject dealt with was the use of aluminium cables. Although these had never been used as shaft cables up to the present, he pointed out that they had been employed successfully for feeders on towns mains, and mentioned cases of which full details were given in *ELECTRICAL ENGINEERING* on Nov. 24th, 1910 (Vol. VI., p. 749), and Feb. 9th, 1911 (Vol. VII., p. 67). The following companies, he said, used aluminium transmission lines, viz., Newton Chambers; Weardale Coal and Iron Co.; Bolckow, Vaughan and Co.; Lambton Colliery; the Leadhills Co.; and the Craighead and Bothwell Castle Colliery Company. Mr. Scott included in

FIG. 1.—APPROXIMATE SAVING ON THE NET COSTS OF BITUMEN AND PAPER-LEAD L.T. ALUMINIUM FEEDERS, BASED ON COPPER WIRE AT 10½D. PER LB., AND ALUMINIUM WIRE AT 11½D. PER LB.

his paper some of the figures and facts published in the two articles above referred to, and also added the following table, prepared for him by Messrs. Johnson and Phillips, comparing three-core copper and aluminium cables of equal conductance (0.15 and 0.25 sq. in. respectively).

Particulars of Three-core Medium-tension Paper-insulated Shaft Cables.

Shape and size of conductors. (Sq. in.).	Ext. dia. of cable. (in.).	Per mile.		
		Net weight. (cwt.)	Gross weight. (cwt.)	Price. £.
Round, 0.15 Cu. ....	2.32	375	471	1,053
Round, 0.25 Al. ....	2.72	440	560	1,003
Sector, 0.15 Cu. ....	2.11	328	424	993
Sector, 0.25 Al. ....	2.50	388	508	918

The cables compared are lead covered, single-wire armoured and jute served and compounded overall. Fig. 1 has been calculated by the British Aluminium Co. for single low-tension unarmoured cables. The author also gave the following comparative figures of tensile strengths, &c. :—

	Copper.		Aluminium.		Steel.	
	Hard drawn.	An-nealed.	Hard drawn.	An-nealed.	Hard drawn.	An-nealed.
Tensile strength, lbs. per sq. in.	60,000	23,000	30,000	16,000	70,000	50,000
Maximum length in feet of strand which can be supported .....	15,500	5,950	25,000	13,600	20,700	14,750

Dealing next with insulation, the author said the advantage of vulcanised bitumen, as manufactured for mining cables,

FIG. 2.—CONE SUSPENSION.

FIG. 3.—SUSPENSION WITH WIRE ROPES.

is that it resists ordinary pit waters. He also suggested the use of "cab-tyre" sheathed rubber cables, as manufactured by the St. Helen's Cable Co., pointing out incidentally that the cleating up in the shaft would be easier than with armoured cable on account of its flexibility. He also recommended "cab-tyre" sheathed sinking cables, but in the discussion Mr. Nelson said that metal armoured cables should be used for such purposes on account of safety.

Several methods of fixing shaft cables were described and illustrated. Fig. 2 shows a method of "single" suspension, at the top end only, suitable only for comparatively small depths. An iron cone is passed over the armouring, and the armouring wires are bent over at right angles and gripped firmly by a top plate held down by four bolts, and the whole

TELEPHONE: RAINHAM, 25 & 26.

is suspended by chains from a girder across the top of the shaft. In another form of single suspension which has been adopted at a colliery in Lancashire a clamp is used, consisting of a steel plate with a number of steel clamping pieces. The cable has split bushes fitted round it, through which it is gripped by the clamps, so that a succession of grips is obtained without the cable being squeezed out of the circular shape. The chains are suspended from a large beam at the top of the shaft. The cables are three-core paper-insulated, lead-covered and single-armoured. The two larger ones are each 300 yds. long and weigh about 8 tons, and the smaller ones are respectively 450, 300 and 150 yds. and weigh 1.8, 1.2, and 0.5 tons. The three smaller ones have been in nine years, and one of the larger ones 4½ years.

A method of suspension by wire ropes is shown in Fig. 8. This method is used in a colliery shaft 500 ft. deep in New South Wales to support a pair of rubber-insulated and braided 19/12 single cables; they are clipped to four-wire ropes by wooden brackets at 15-ft. intervals.

For most shaft cables in this country wooden cleats are employed. The usual form of cleat, the author said, is about 3 ft. long, 12 in. wide, and 6 in. thick. A hole is bored through it lengthwise to the exact size of the cable. Then the block is sawn in half, and after the cable has been pressed into the grooves, the ½ in. taken out by the saw is sufficient to give the necessary grip. Elm and pitch pine are generally used. The resin in the pine assists the grip of the cleat on the cable and resists absorption of water. Oak is not suitable because of the tannic acid it contains. Various methods of fixing the cleats have been described in our columns from time to time, but we illustrate in Fig. 4 a less usual method recommended by Mr. Scott, in which the cleats are fixed to chains to give greater flexibility.

The author suggested the use of unarmoured cables in casing formed of split telegraph poles, in the manner illustrated in Fig. 5. The pole is sawn in two and one of the halves grooved. Then, when the cable is in place, the two halves are secured by steel bands which are slipped over like bracelets and then driven down towards the butt. The two halves are thus closed in in much the same way as a cooper is able to close completely the joints between the staves of a

barrel. Bolts and screws are done away with altogether. The poles would be erected with the butt-end downwards, and the small end of the pole immediately below would fit into the butt-end of the one above, as shown at B, B. This, he contended, would avoid the possibility of an open joint between the various lengths, which is one of the causes of trouble with ordinary sawn casing. The poles are secured in the shaft by cutting "gains" in the side, so that each

FIG. 4.—CLEAT ATTACHED TO TUBBING BY CHAINS.

FIG. 5.—CASING MADE FROM SPLIT TELEGRAPH POLES.

pole is keyed, as it were, against the buntons. The poles are held to the buntons by steel straps, as shown at C, C.

In support of his advocacy of unarmoured cables earlier in the paper, the author instanced a mine in New South Wales where the armour on a shaft cable was useless in less than six months, and another in this country where a steel rope, used in a shaft as the earth return, became so corroded that a special copper cable had to be put in instead.

Finally, Mr. Scott recommended the use of the Powell process of applying saccharine and arsenic for the preservation of wood cleats and casing, more particularly to prevent the white-out trouble. It has, he says, been used with success for cable troughing in Sydney (N.S.W.). Stockholm tar, if employed, should be, said he, boiled before use to drive off acids and water, although this diminishes the volume by about 25 per cent.

In the discussion, as already mentioned, Mr. Robert Nelson (H.M. Electrical Inspector of Mines) said that the use of unsheathed cables in shafts was prohibited by the Rules for pressures exceeding 250 volts. Although there might be less danger of damage to shaft cables than to cables in-bye, the difficulty of repairing them was greater. He was not in favour of aluminium cables for shafts; to compare the lengths of wire of aluminium and copper which would support their own weight was beside the question. That the aluminium cable had to be of 50 per cent. larger external diameter for the same conductance was important; he was himself in favour of keeping down the size of shaft cables—two 0.15 sq. in. cables were better than a 0.3 sq. in. He advocated heavy armouring, and the fact that in the case of cables of large section the Special Rules called for heavier armouring than the E.S.C. standards was, he thought, a move in the right direction. Sinking cables should also be armoured. After some remarks by Prof. Arnold Lupton, Mr. J. H. C. Brooking said that the expression of Mr. Scott's views must be taken as information, and not as gospel, and preferred not to express an opinion as to the use of cab-tyre sheathed cable in shafts. Mr. E. V. Pannell (British Aluminium Co.) said that Mr. Scott's list of collieries at which aluminium cable was used could be easily quadrupled, and complained that Mr. Nelson's estimate of 50 per cent. increase in diameter was far beyond the mark. Mr. W. H. J. Powell, the inventor of the saccharine process of preserving timber, mentioned in the Paper, spoke a few words, and was followed by Mr. C. J. Green (Callender's), who favoured the making of joints in aluminium cable in the form of a mould, rather than the mechanical joints with copper clamps. Mr. Green also reminded Mr. Scott that the heating of a cable placed in a casing made of telegraph poles would have to be considered. Mr. H. H. Berry (Berry & Skinner) called for more standardisation in mining work, and the Chairman (Mr. W. C. Mountain) closed the meeting by proposing a vote of thanks to Mr. Scott, which was heartily accorded.

## RECENT PROGRESS IN ELECTRIC IRON SMELTING

**E**LECTRIC smelting of iron ore is now carried on commercially in Sweden, Norway, and in California, and plant will shortly be put down for the same purpose in Switzerland, Italy, and elsewhere. The works at Trollhättan of the Strömsnas Aktiebolag, Degerfors, and the results obtained were dealt with on page 73 of *ELECTRICAL ENGINEERING* of Feb. 6th. The other Swedish works are at Hagfors and Domnarfvet.

The Uddeholms Aktiebolag, of Hagfors, installed a 3,000 h.p. furnace for iron smelting with charcoal in March, 1912. This is similar in construction to the Trollhättan furnace, except that it has six electrodes, each of the phases of the three-phase supply working separately on two electrodes. The Company are so satisfied with the results obtained that they have set aside the sum of £325,000 for the purchase of two further furnaces of 3,000 h.p. each to be installed at Hagfors, and three others, also of 3,000 h.p. each, for their works at Nykroppa. It is stated that the Company intends to substitute entirely electrical smelting furnaces for all their present blast furnaces. No actual figures of the results which have been obtained are available.

The Stora Kopparbergs Bergslags Aktiebolag, of Domnarfvet, were amongst the first to start experimenting with electric smelting furnaces, but, although they have obtained very satisfactory results, it appears that they have devoted the last year or two to experimental work, as they turned out very little electrically produced pig-iron last year.

Electric iron smelting is carried on in two places in Norway. At Tyssedahl, Hardanger, the Hardanger Elektriske Jern Og Staalverk installed a 3,000 kw. furnace and plant some eighteen months ago. This furnace has been working for about eight months with coke only as the reducing agent, turning out about 17 tons of pig per day. The iron produced is of a very high quality, but the energy and electrode consumptions are considerably higher than those obtained at Trollhättan, partly on account of the difficulties of working with coke, and partly due to the nature of the ore used there.

The other Norwegian plant is at Notodden, where the Tinfos Jernverk have been working a 1,500 kw. furnace for some months. Three-phase power is obtained from the water-power station of the Tinfos Papier Fabrik, to which the iron-works company is affiliated, at the rate of 38s. per kw.-year. They smelt a magnetite ore containing 45 to 48 per cent. of iron, and use coke only, producing about 2 tons of iron per electrical horse-power year.

The Noble Electric Steel Co., of Héroult, California, have a 2,000 kw. furnace for electric iron smelting, and produce a special soft foundry iron practically free from phosphorus, sulphur, or manganese. Their energy consumption is higher than the Trollhättan figures, but as the iron produced obtains a high price, the furnace is a commercial success.

Since the historic experiments at Sault Ste. Marie in 1906, the Canadian Dept. of Mines has been carefully studying the question of electric smelting, and it is stated that they will shortly issue a report demonstrating that electric smelting of Canadian iron ores is a commercial possibility.

A 2,500 h.p. smelting furnace (Elektrometals type) has been ordered for a works in Switzerland, and a company has been formed in Italy, the Società miniere di Cogne, for the purpose of establishing a large electric smelting works near Aosta, near which place there are large deposits of excellent ore. Four water-power stations of a total capacity of 37,000 h.p. are proposed.

### Examinations of the Association of Mining Electrical Engineers.

—The Association's examinations for competency in mining electrical engineering will be held this year on March 8th and 15th simultaneously in ten different centres. To qualify for a first-class certificate, candidates must sit for all four of the following Papers:—(1) Alternating current theory and practice; (2) direct current theory and practice; (3) special rules, distribution of electrical energy; (4) electric lighting, signalling, miscellaneous apparatus. For a second-class certificate Papers (1) and (2) may be omitted. Candidates who had not had mining experience may present themselves for examination and obtain a pass, which will be converted into a full certificate on subsequent production of evidence of mining experience. Diplomas or certificates already held by candidates will be taken into account, but will not exempt from any part of the examination. Every candidate will be required to pay a fee of 5s. before presenting himself for examination. Every candidate for examination must be on the register of the Association. Any further information can be obtained from the General Secretary of the Association, C. St. Clair Saunders, Bank Chambers, London Road, Derby, or from any of the Branch Secretaries.

## THE DEVELOPMENT OF ELECTRICITY FOR MINING

**M**R. R. NELSON (H.M. Electrical Inspector of Mines) recently delivered a lecture, entitled "The Development of Mechanical Power in the Mines of the North-Eastern Coalfield: A Comparison and a Contrast," before the North of England Branch of the Association of Mining Electrical Engineers in Newcastle-on-Tyne. The lecturer said that the transmission of power below ground by electricity was a development comparable with that which followed the first application of steam power to mining work. A very early suggestion regarding the future possibilities of electricity for underground work was contained in a paper by Mr. Henry Davy, contributed to the Institution of Mechanical Engineers in 1882. In 1888 an electrically-driven pump was put to work in the North Seaton Colliery. The problem of the economical haulage of heavy trains of coal below ground was solved towards the latter end of last century by the introduction of electricity. At the present time two problems lacked adequate solution. They were some mechanical means of getting the coal and of handling it at the coal face, and some better means of lighting than that provided by the oil safety lamp. About three times the light was required without increase in weight. Several lamps very nearly fulfilling these requirements were already obtainable. The system of mining known as "long-wall" was the most suitable for the employment of coal-cutting machines. This is not commonly adopted in Northumberland and Durham. Attention might be drawn to an electric coal-cutter which automatically adjusted its forward travel when a hard place in the seam was reached, preventing a demand on the motor in excess of a predetermined maximum. The present century had, he said, witnessed nothing in mining comparable with the wide adoption of electricity. Motors totalling over 100,000 h.p. were now at work in the mines of Northumberland and Durham. For pumping, coal-cutting and coal conveyance, electricity now stood pre-eminent, and a modern installation might be made "ironclad" throughout from generator to motor. The development of safety cut-outs depending on leakage had reached a high practical efficiency. An important advance had been made, comparable with that due to the invention of the safety valve in steam engineering, in this art in quite recent years. Electrical apparatus might be so protected that if the current were rightly used—that was, only where the risk of accident arising therefrom was, so far as could be seen, negligible—the standard of safety was as high as that to be attained by any machinery in any situation.

Replying to a question as to the cost of electric winding, Mr. Nelson said that he imagined the great inducement was the fact that electricity was economically necessary for 75 per cent. of the mining operations, so that it was economically unsound to adopt other methods for the remaining 25 per cent. with electrical energy at anything like a reasonable cost.

**The Edison Miner's Lamp.**—Mr. T. A. Edison has been awarded the Rathenau Medal, given annually by the A.E.G., for "the best device or process in the electrical industry for safeguarding industrial life and health" for a miner's lamp working with a two-cell Edison alkaline battery arranged in a steel container.

**Electricity for Coal Mines in Nova Scotia.**—The coal mines in the Cape Breton district near the mouth of the St. Lawrence River, Nova Scotia, are, according to the *Electrical World* (New York), rapidly adopting electricity for their motive power. A new turbine station is being built generating at 6,600 volts 25 cycles. To prevent the power factor from falling below 80 per cent., some 600-h.p. synchronous motors driving air compressors are made to take a leading current by field adjustment. These motors are started as induction motors from auto-transformers with high-pressure oil switches having a large overload capacity. A large hoist is situated near the new generating station. It handles 1,200 tons per ten-hour day. The haul is made on a 22.5 per cent. grade 4,500 ft. long. The total gross weight of 30 cars per trip is 82,500 lb. For this work use is made of a direct-current motor mounted on the winding drum shaft and supplied with energy from a motor-generator. This motor has an intermittent load rating of 1,600 h.p., and operates normally at 50 r.p.m. In the near future two more electrical coal hoists of the same character will be installed, and will haul 24 cars up a 32 per cent. grade at a maximum speed of 30 ft. per second. The gross weight per car will be 2,900 lb., and the length of the slope between 3,000 ft. and 5,000 ft., with an output of 1,200 tons in eight hours. In order to diminish the load at starting the cars in this mine will not be started on the grade, but from a level stretch of track laid at the working face of the mine.

## ELECTRIC CABLES IN MINES

**M**R. G. W. ANDERSON read a paper recently before the Manchester Geological and Mining Society raising a number of practical points regarding the installation of cables in mines. Regarding the types of cable to be employed, rubber, he said, were only used in short lengths for making off or tailing other cables, or for temporary or special purposes. Paper cables had the disadvantage of being hygroscopic, and in the author's opinion bitumen was the most suitable insulating material. He explained the method of construction of bitumen cables, and passing on to the question of sheathing he pointed out that under the new rules it was necessary that the conductivity of the coverings must be equal to 50 per cent. of that of the largest conductor that they enclose. This, however, did not entail more than very slight reinforcement of the sheathings of any but large-size cables above the usual standards adopted by manufacturers. He enlarged upon the necessity for protection of the armouring from corrosion. Armouring was considered undesirable for trailing cables. They are usually laid up with an earth conductor having a conductance of not less than 50 per cent. of that of the largest main conductor, with a minimum conductivity equivalent to 0.022 sq. in. of copper.

The space between generating station and headgear was perhaps the most prolific field of any for cable breakdowns. The best means of grappling with this difficulty was either to build a well-ventilated surface culvert in which the cables would be carried on brackets; or to sling them overhead from a catenary wire. Old haulage rope would generally be used for this purpose.

The author then dealt with methods of suspension of cables in shafts, recommending hard wood cleats for gripping the cable by friction and resting either on existing structures or on segmental girders erected for the purpose. Single suspenders on the wedge principle are sometimes used. In the author's opinion, the safest method of lowering shaft cables was to fasten the cables by lashings or small, specially made clamps, to a wire rope controlled by a hauling engine.

For the installation of cables in roadways, intake airways should be selected, and the position chosen for the run should be such as to afford the greatest security from mechanical damage. In main roadways where there are good walls and sound roofs, the cables may be fixed in a permanent manner by cleats. Where there is a liability of damage from falls, the cables should be suspended in such a manner and with so much slack that they will readily tear away without fracture. For installing, it is advisable to take the new roadway cable down the pit intact on its drum, jacking it up on an improvised trolley running on tub wheels, and paying out as the trolley moves along.

With regard to cable boxes the principal requirements were: absolute watertightness and mechanical strength; long bearing glands, which will prevent any undue strain being put upon the cable or the internal fittings of the box, while they are capable of making a very effective connection with metallic sheathings; adequate means of bonding through from sheathing to sheathing; and such design as will reduce to a minimum the risk of cavities or "blowholes" forming in the compound.

## ELECTRICAL MINING AND METALLURGICAL PATENTS OF FEBRUARY

### Mining.

**A**MONG the Patent Specifications published by the Patent Office during February may be mentioned No. 1,013 '12 by H. Hunte and A. Hunte. It deals with miners' safety lamps. The accumulator is enclosed in an aluminium case. The lid is recessed on the top to receive a sunk rotary switch. A lamp, mounted within a thick U-glass, surrounded by a metal cage whose base has spring projections which constitute part of the switch. A rubber joint prevents access of air. The accumulators have lugs instead of terminals. These lugs fit over pins on the inside of the case, and by closing the case the whole is locked. No wires are used, all connections being by copper rods and spring plungers. A quarter turn of the lamp cage lights the lamp, a further quarter turn puts it out. Similar lamps may be mounted in front of, or at the bottom of, the casing.

Patent No. 5,217 '12, communicated to The Sterling Telephone and Electric Co., Ltd. by Schaffler and Co., of Vienna, describes some improved details for mine exploders. The driving spring, which is wound by the handle, is released by hand by a separate ratchet gear. The spring can only be released

when wound to a definite extent, and when released the ratchet pawl is prevented from dropping back and stopping the machine until the spring has run down a definite amount. It is thus impossible for the exploding current to be too feeble.

### Metallurgical.

The Patent Specifications published during February which have more particular bearing on the metallurgical industry include No. 2,709/12 by S. Cornthwaite. Open-hearth steel-melting furnaces, either tilting or fixed, are provided with a movable roof, air and gas ports and regenerative chambers, &c. At least two furnaces are required. A single gas producer supplies both. A trolley is provided carrying electrodes above the furnaces for heating either. To insert the electrodes into the furnaces motor-driven rack and pinion gear is provided. In operation gas is used for melting the charge in one. The gas supply is then transferred to the second, and the remaining treatment of the first charge is done electrically. The process is thus continuous. Specification No. 7,367/12, by J. Rennerfelt, applies to arc heated cylindrical crucible furnaces. Means are provided for the use of both horizontal and vertical watercooled electrodes. These are given longitudinal, transverse and radial motions, and may be arranged for two- or three-wire direct or for alternating currents. For adjusting the lengths of the arcs, the electrodes slide in copper-gauze packing within a tube insulated from the cooling jacket by asbestos. The electrodes are protected from the furnace heat by refractory shields moving with them. The crucible is provided with ribs to prevent local overheating of the charge by oscillation of the crucible due to deflection of the arcs downwards. In No. 19,287 '12 L. Gonnet proposes to do away with the sole, or hearth, in horizontal electrode furnaces. This sole usually serves both as an electrode and as a receptacle for the products of fusion. To withdraw it necessitates the stoppage of the furnace. In the design proposed the charge is introduced through a strainer and falls on a grating made of interchangeable parts placed alongside one another and formed with tronconical orifices which retain the small particles until they fuse. The metal passes through the grate and can be removed through a special door. The electrodes are maintained the correct distance apart by a relay. In No. 21,290 '12, by J. M. Bocuze, a means is described whereby in radiation furnaces for melting precious metals the necessary rotary movement of the crucible and reciprocating vertical movement of the electrodes is obtained in a simple way without preventing the crucible being rocked to run off the metal.

In Specification No. 8,668 '12, by G. Tischenko, a process for the manufacture of sheet-iron in band form is claimed. The iron is first deposited on a continuously rotating horizontal, lead-lined drum. The band is then separated from the drum near its line of emergence from the electrolyte and guided to a water-bath; thence through a glowing furnace and a grinding or polishing machine. It is then passed through a corroding vat and a hot-water bath and is finally wound on a roll.

**Prizes for Papers on Mining Subjects.**—The Council of the Association of Mining Electrical Engineers announces that the following prizes are offered for Papers for the present session:—An Association prize of five guineas for the best Paper read at any branch; a prize of two guineas given by Mr. Carlrow for the best Paper by a member of the East of Scotland Branch; a prize of four guineas given by Mr. A. Anderson and Mr. Matthew Brown for the best Paper by a working colliery electrician who is a member of the West of Scotland Branch; and a premium of two guineas given by Lord Joicey for the best Paper by a member of the North of England Branch. Any further particulars can be obtained from the General Secretary of the Association, Bank Chambers, Derby, or any of the Branch Secretaries.

**The Association of Mining Electrical Engineers and its Examinations.**—At a meeting of the London Section of the Association of Mining Electrical Engineers last month, Mr. W. C. Mountain (who was in the chair) said that the Association had now a thousand members and eleven branches, including a branch in Australia, and there were now 55 members in the South of England Branch, including 10 at the Dover coalfields. The system of examinations had been a success. At present they had 120 certificated members, and it was proposed to hold the next examination in the Northampton Institute this month. Speaking personally, he could confidently say that the fact that a man held a certificate from the Association carried considerable weight with employers in engaging men for responsible positions in collieries.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelopes.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,329.

In a workshop with 2-phase, 4-wire installation, two single-phase meters are provided by the Supply Co. for purpose of charging. A two-phase meter is also connected for checking purposes. The load is mixed, and consists of: (a) lights; (b) some two-phase induction motors; and also (c) a single-phase motor. It has been found that the meters agree when (a) and (b) are running, but when (c) is switched in the single-phase meters register less than the two-phase meter. The meters have been tested separately and found correct.—S. C. R. (Replies must be received not later than first post, March 13th.)

### ANSWERS TO No. 1,327.

A magnet is wanted to give a direct effort of about 120 lbs. on a brake shoe, applied direct as a push not more than  $\frac{1}{4}$  in. from a simple bearing knob on the solenoid. The current available is 200 volts D.C. Give dimensioned sketches sufficient for construction, with particulars and calculations of the winding and of a resistance to bring on the full effort slowly.

"MAGNET BRAKE."

The first award (10s.) has been given to "M. M." for the following reply:—

The formula usually employed is  $P = \frac{B^2 A}{72,200,000}$

whence

$P$  = pull in pounds,  
 $A$  = area in sq. inches,  
 $B$  = density of lines per sq. in.

Take an arrangement as shown in Fig. 1. For convenience two solenoids are suggested; the cross-bar is pulled down

FIG. 1.

by the cores and returned to its place by the helical spring. With a density of 50,000 lines per sq. in. and allowing 30 per cent. for leakage, this gives us  $\frac{70 \times 50,000}{100 \times 1} = 35,000$  in gap.

The spring has to be overcome, and if we allow 20 lb. extra for this we have 70 lb. pull for each core.

Then:—

$$\text{Area} = \frac{70 \times 72,200,000}{35,000 \times 35,000} = 4.13$$

$$\therefore \text{Diameter} = 2.3 \text{ in. (approx.)}$$

$$\text{Ampere turns} = 0.3183 B l,$$

where  $l$  = length of air gap =  $\frac{1}{2}$  in.

If each coil is 6 in. in length and we wind with No. 14 D.C.C. copper wire, we shall have about 540 turns per coil.

The current will then be  $\frac{3,133 \times 35,000}{10,000 \times 1} \times \frac{1}{2 \times 540} = 10$  amperes approx.

This is rather a large current from No. 14, but probably the solenoid will only be used at intervals.

No reply of sufficient merit for a second award has been sent in. Mention may be made, however, of the reply of "L. B." which commences as follows:—

To apply the full effort gradually, it is better to use a dashpot, either oil or air-cushioned. With a resistance either in series or as a potentiometer, when the voltage on winding is sufficient, by a small percentage, to overcome the weight and friction, the solenoid is immediately lifted, so that this method is useless.

The design shown in Fig. 2 is the most economical form for a short stroke of  $\frac{1}{4}$  in., and by making the plunger a good fit in tube a compression air dashpot is obtained which, with a

FIG. 2.

small air vent hole, will give the cushioning effect desired. The external cast-iron magnetic circuit can have several ventilation holes, as the section need not be large. Saturation of this circuit helps greatly to keep the attracting force constant. The cone-shaped plunger also gives a more constant pull than a flat end, which would only give a pull less than half that obtained with cone at beginning of stroke.

"L. B." uses the same formula as "M. M." to work out the sectional area required, but unfortunately there is an error in the calculation. We therefore give his sketch without the dimensions.

**Metal Filament Lamp Tests.**—A series of life tests of thirteen makes of metal filament lamps has just been completed by the Westminster Electrical Testing Laboratory. The results are published in a volume, on sale at 2½ guineas.

**New Procedure in U.S. Patent Cases.**—According to the *Electrical World* (New York) an "Assessor" (a disinterested person skilled in the art) may be appointed by the consent of all parties in a judicial patent action to sit with the judge and assist the court in its deliberations. This is following German practice.

**International Congress of Consulting Engineers.**—The "Chambre Syndicale des Ingénieurs Conseils" of Brussels, and the French institution of the same name, are organising an International Congress of Consulting Engineers, to be held in June or July of this year at Ghent during the exhibition. The congress will be open to "experts" as well as fully independent engineers. The formation of an International Committee, societies in other countries, and the discussion of the sphere of work and the professional etiquette of the consulting engineer, are included in the programme. Further information can be obtained from the offices of the Belgian Society at 18 Rue Marie-Thérèse, Brussels.

## FLEXIBLE WIRES FOR RADIATORS

THE accompanying illustration shows a specially designed wire which Siemens Brothers and Co., Woolwich, are supplying for use with all kinds of heating apparatus, such as radiators and irons, and it is also suitable for portable hand-lamps in garages and other places. It contains two rubber-insulated flexible conductors of fine tinned copper wires, and can be provided when necessary with an earthing wire to meet the Home Office Regulations for workshops. The wire is supplied with either a polished cotton-braid finish or a flexible metallic covering, the latter being recommended where the wire is likely to be subjected to severe mechanical use. In either case, a special feature of the wire is the

ARMOURED FLEXIBLE FOR RADIATORS, &amp;c.

provision of a wrapping of metallic foil immediately beneath the cotton braid which protects the rubber insulation from grease, oil, and other injurious substances. It is desirable that the surface of any metallic protective covering employed for this class of wire should be perfectly smooth, so that it can be handled without any possibility of the slightest injury being caused to the user, such, for instance, as would result from the sharp points of broken wires of a metallic braiding. It will be seen from the illustration that this condition is fulfilled by covering the wire with a special wrapping of segmental aluminium or brass, the rounded outer surface of which gives the finished wire a very neat appearance. It need only be added that the finished product possesses the required degree of flexibility without being springy.

STREET LIGHTING STANDARD FOR METAL FILAMENT LAMPS.

## "WHITE WAY" STREET LIGHTING

IT is generally recognised that bright lighting in business streets is a great incentive to prosperity, and illumination of this character is known in America by the characteristic name of "White Way" lighting. A type of lamp-post, specially designed for the purpose with a view to decorative effect as well as brilliancy of illumination, is being introduced into this country by the British Thomson-Houston Co., Ltd. (Mazda House, Upper Thames Street, E.C.), and an example is illustrated here. The post has four side arms and a central upright lamp, the whole being supported by an artistic pillar. The equipment may consist of Mazda lamps of any size from 60 to 200 watts, enclosed in special diffusing globes made of Alba glass. The globes are made of the same glass as the well-known Alba semi-indirect lighting bowls, only thinner. This glass has a low absorption factor, and diffuses the light so thoroughly that the whole exterior surface appears evenly illuminated. We are informed of a case in America where one side of a street was equipped with these fittings and soon had almost a monopoly of the business until the other side was similarly lighted.

## ELECTRIC TAILORING IRONS

THE General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), have brought out a design of electric tailoring iron which should entirely dispel the adverse criticisms regarding insufficient heat, high maintenance cost and fragility which have sometimes prevented the obvious advantages of electric irons being taken advantage of in the tailoring and allied industries. These irons have been most thoroughly tried in actual use, and the amount of heat developed in a 700-watt iron is well shown by the way it will scorch a wooden board if laid down on it. The "Magnet" tailoring iron, as the accompanying illustration shows, follows the lines of the "Magnet" domestic iron. The elements are

"MAGNET" TAILORING IRON.

replaceable, and a new element can be readily inserted at a cost of a few shillings. These irons are made in weights varying from 12 lb. to 25 lb.—the former specially adapted for dressmakers' use, the latter for heavy tailoring work. Attention is drawn to the flexible connection which in the old type of iron has been one of the chief causes of complaint. The flexible cord in this new iron is of strong make, heavily insulated with rubber, and covered with a thick layer of asbestos, and finally finished off with heavy cotton braidings. The connection with the heating element is made in a substantial box. Fitted behind the handle of the irons to this box is attached a strong spring, extending for about 9 ins. along the flexible connection, thus preventing any undue wear on it. The heating element consists of a narrow metal ribbon strip, made of a special alloy, which is utilised in such a way as to give it a long life and efficiency in working.

**Finnish Water-power Concession.**—A Berlin banking group, consisting of the Deutsche Bank, the Bank für Handel u. Industrie, the Akt.-Ges. für Licht- u. Kraftanlagen of Berlin, and others, have acquired a concession to develop the Wallinkoski waterfall of some 44,000 h.p., the second largest in Finland. Work is to be commenced at once, and it is expected that some of the power will be taken for the Helsingfors-Wiborg-Petersburg railway, which may shortly be electrified.

**Annual Dinner of the Manchester Local Section of the Institution of Electrical Engineers.**—This dinner, held on Friday last, was presided over by Prof. E. W. Marchant in the absence of Mr. A. A. Day, Chairman of the Section. Dr. Ferranti, in his speech proposing the Corporations of Manchester and Salford, voiced his well-known views on municipal trading, and put in a plea for co-operation between local authorities and public companies. Councillor S. W. Royse (Lord Mayor of Manchester), in his reply, defended municipal control of electric supply, but did not believe that the trading departments of a Corporation should allocate large profits in relief of rates, but should devote them to reductions in prices. Prof. E. Rutherford proposed the toast of the Institution, and emphasised the strong connection between physical research and electrical engineering. He would like to see more physical Papers in the Journal. Mr. W. Duddell agreed that mathematical and physical Papers were quite suitable for the Journal, but they were sometimes difficult to discuss at meetings. The Institution was now about to move in the way of research. He further referred to the lending library and to the examination scheme, saying that the examinations were going to be so arranged that anyone who really knew his work could sit at once without having to cram. Prof. E. W. Marchant also replied, and Mr. W. Cramp proposed the guests, regretting that the constitution of the Institution was not still more democratic. Many matters, he said, were settled in London, which might be first referred to the local Sections before being finally settled. Again, many documents came to the Chairmen of the Local Sections marked private and confidential, which he thought should be open to the whole committees.

AND  
LONDON

## ELECTRIC TRACTION NOTES

Mr. G. D. Snyder read a paper entitled "Notes on City Passenger Transportation in the United States" before the Institution of Civil Engineers on March 4th. New York has 133.17 miles of line and 95 miles under construction. The length of line in Chicago aggregates 74.56 miles. The municipality now proposes to construct fifty-six miles of underground railways at an estimated cost of about £48,000,000 without equipment, the latter amounting to about £17,500,000. In Boston there are 24.48 miles of line and 6.88 miles under construction. In Philadelphia there are 7.41 miles of line and 17 miles on private right of way. In all there are 250 miles of high-speed city lines in the United States and 174 proposed. The length of trains has increased from three cars on the first elevated to ten cars in the New York subway. The density of traffic on this line is four million passengers per mile of track per annum. The number of passengers per annum is increasing as the square of the population. New York had forty-three passengers per head of population in 1860, 322 in 1910, and at the present rate of increase the number will be 913 in 1950. The fare is almost universally 5 cents. Automatic block signals are not used on the older elevated lines nor on the local tracks of the New York subway except at special points. They are used on express tracks in New York and Chicago, and for multiple-unit trains in Boston and Philadelphia. A headway of ninety seconds can be maintained with automatic block signals with a speed of forty m.p.h. A headway of twenty seconds has been maintained without signals and with low speed. On three-track lines express trains are run in one direction in the morning and in the other in the evening. The earlier lines were built with private capital under perpetual franchises, but the municipalities are now building the lines and leasing the right to work them for a term of years. Underground lines cost £415,000 to £2,000,000 per track mile and elevated lines £100,000 to £300,000—without equipment.

The first General Meeting of the reconstituted Institution of Railway Signal Engineers was held at the Grand Hotel, Birmingham, on Feb. 25th. Mr. A. T. Blackall, the Signal and Telegraph Engineer of the Great Western Railway, was elected President, and Mr. J. Sayers, the Telegraph Superintendent of the Midland Railway, Vice-President, for the ensuing year. A paper by Mr. R. J. Insell on "Signalling and its Connection with the Construction and Management of Railways" was read and discussed. Information regarding membership may be obtained from the Hon. Secretary, Mr. W. H. Cotterill, Telegraph Department, Midland Railway, Derby.

The Aberdeen Suburban Tramways Co. is considering the adoption of trolley omnibuses for an extension of their system to Donside.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

Several automatic and semi-automatic telephone exchanges will shortly be working in France. The postal authorities have decided to instal semi-automatic exchanges according to the American MacBerty system in Marseilles and Angers, apparatus for 7,500 lines in the former, and 1,400 in the latter case. It is intended to introduce this system into all new Paris exchanges if it comes up to expectations. The network in Nice is now being converted to the full automatic Strowger system, while another automatic exchange is under construction in Orleans.

A list of wireless stations published by the "Bureau des Welt-telegraphenvereins" gives the following informations: (1) Coast stations: Great Britain, 43, of which 37 Marconi and 6 other systems; Canada, 33, of which 31 Marconi, 2 other systems; Germany and German Colonies,

22, all Telefunken; France, 17, all systems other than Marconi or Telefunken; Italy, 19, all Marconi; Russia, 19, 15 Telefunken, and 4 Marconi; Brazil, 11, 5 Telefunken, 4 Marconi, and 2 other systems. The United States has over 142 coast stations. (2) Ship installations: Great Britain, 643, of which 15 Telefunken, 571 Marconi and 57 other systems; Germany, 302, all Telefunken, although 37 of them are given as partly Marconi; France, 203, 41 Marconi, 162 other systems; Italy, 123, all Marconi.

The Eastern Telegraph Co. announced on the 25th ult. that the Zante-La Cané (Crete) and the three cables between Zante and Patras were broken. Telegrams for Greece, excepting Zante, Corfu and Pyrgos could only be accepted via Malta-Zante at senders' risk and subject to delay.—Another possible route exists via Malta-Alexandria-Sitia-Syra at a rate of 2 francs per word.—The El Arich route was down beyond Beyreuth on the same day and was put right on the 26th ult.—With regard to communication with Mexico, it is cut to Amecameca de Mexico, Ascension de Chihuahua, Coyame, Chemase, Choapan, Carrizal de Michoacan, Cilas, Espila, Falomir, Guadeloupe de Chihuahua, Ixtlande Juarez, La Union de Guerrero, Matamoras, Izucar, Nazas, Ojitas de Chihuahua, Hacienda, Ojinaga, Petatlan, Cenoles, Quimichis, San Jose de Gracia, San Luis de la Loma, Yecpan de Galeana, Yizimin, Villa Alta, Valladolid de Yucatan, Lihuatanejo. All telegrams for the interior of Mexico are subject to delay.—Code and cipher are accepted for all places in Mexico.—On the 26th ult. communication with all places in the State of Morelos, Mexico, was interrupted.—Our advices on this day also state that the cable between Lemnos and Salonika was down, entirely cutting off the latter place by the Eastern routes.—The Bathurst-Bissao cable was repaired on the 27th February as well as one of the Zante-Patras cables, but traffic for Greece, excepting Zante, Corfu and Pyrgos, is still subject to delay via Zante.—The Greek Administration has agreed with Servia to join the lines between Salonika and Uskub.—Messages between Salonika and Europe only are transmitted over these lines.—The Eastern Co. on the 28th ult. repaired the second Zante-Patras cable, thus relieving traffic for Greece of delay via the Malta-Zante route.—From special sources we hear that the Galveston-Vera Cruz cable was down on 12th February last and also that the New York-Haiti cable of the French Co. was interrupted from 4th to 20th January last.—A ship's anchor was responsible for damage to one of the cables between Jamaica and Cuba, but was quickly repaired.—On 3rd inst. the via Fao and El Arich routes were down between Constantinople and Ismid.

Reproduced, with permission, from Monday's "Daily Graphic."

THE STEPMOTHER.

"Now, come on, you little brat; if you think I'm going to spend all my time looking after you, you're mistaken!"

# "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

## Specifications Published Feb. 27, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

2,442/12. **Electrostatic Alternators.** W. PETERSEN. The high harmonics which are formed when the machine runs light are made to circulate in resonating circuits in armature and field, so as to produce higher harmonics. The machines are asynchronous and may be made self-exciting. Thirteen figures.

2,468/12. **Incandescent Lamp Blackening.** B.T.-H. (*G.E.C., U.S.A.*). To prevent blackening of the bulb and the disintegration of the filament in drawn-wire lamps, a volatile compound of the filament material, which is unstable at the running temperature of the lamp, but stable and formed from its elements when colder, is inserted in the bulb. Many halogen compounds are suitable. All traces of water vapour must be eliminated and the pressure must be very low, generally less than 1/1,000 mm.

2,630/12. **Booster Connections for Battery Charge and Discharge.** To charge a battery at double its normal rate or for other purposes, with four boosters two armatures are connected between a pair of booster bus-bars connected to a D.P. double-throw change-over switch. Another two armatures are connected between two other booster bus-bars. Each pair of bus-bars is treated as the terminals of a single machine, and the two pairs are connected to a D.P. double-throw change-over switch. Three of these switches are used, therefore, and the armatures may be put all in series, all in parallel, or two in series and two in parallel. Three figures.

2,734/12. **D.-C. Dynamos.** BROWN, BOVERI. Stable working of self-excited D.-C. machines is effected by arranging for the ratio of magnetic material practically saturated at low values of total flux to the whole cross section of the magnetic path between 1:4 and 1:10, or even 1:12. This may be effected by adjusting the air gap or the contour of the pole faces and armature teeth. Six figures.

2,746/12. **Engine Starter.** H. LEITNER. A fixed and a free-wheel pulley or gear-wheel are arranged on the dynamo shaft and similar wheels on the engine shaft. The fixed wheel on each shaft engages with the free-wheel on the other. The two free-wheels are free in opposite directions. The gear through which the motor drives the engine is much higher than the reverse gear. Two figures.

3,099/12. **Double-ended Straight Filament Incandescent Lamps.** A. W. BEUTTELL and J. A. MANNERS-SMITH. A number of filament sections are arranged end to end. At least one support of each filament end is movable and tensions each filament section. Ten figures.

3,397/12. **Enclosed Focussing Flame Arcs.** CROMPTONS' and C. CROMPTON. The gases are withdrawn from the top of the arc enclosure through circulating passages and long up-cast pipes to the condensing chambers a considerable way up the lamp. They return by direct down-cast pipes to the bottom of the arc enclosure. Three figures.

4,783/12. **Incandescent Lamp.** C. F. STILLMAN. The filament is arranged at right-angles to the spider stem. This lamp was illustrated and described in *ELECTRICAL ENGINEERING*, Vol. VIII., p. 231, May 2nd, 1912, in an article on Earl's Court Exhibition.

6,922/12. **Safety Alarms for Electric Trains.** SIEMENS BROS. DYNAMO WORKS and F. LYDALL. Instead of the brakes being applied, should the driver release his hold of the master controller, leaving the reversing drum in an operative position, pressure is applied to an alarm circuit to the guard's van or other points on the train. Three figures.

7,133/12. **Petrol Electric Vehicles.** H. PIEPER. Petrol engines drive direct on to the axles, and are assisted in times of stress by electric motors supplied from engine-driven dynamos. A buffer battery is also carried. Speed regulation is effected by adjusting the dynamo pressure, by adjusting the motor field, or by using the battery instead of the dynamo. Three figures.

12,784/12. **Repairing Incandescent Lamps.** M. DU MOULIN. A reinforcing ring of soft, easily fusible glass is applied to the edges of the severed lamp bulb when the joint is remade. Two figures.

13,233/12. **Petrol Electric Vehicles.** H. PIEPER. As applied to railway trains, each motor-car is a complete unit with engines, dynamos, motors, and battery. For starting, each car is connected as a complete unit, but for running, the electric machines and batteries are connected in series. The change is effected when speed regulation by field variation would be started. It is carried out by magnetic clutches between the motors and the driving wheels. Speed regulation may also be effected by varying the number of batteries in circuit. Seven figures.

14,654/12. **Metal Filament Wire Drawing.** K. FARKAS. The wire is heated electrically, and, while hot, is drawn in one direction. It is then reheated and drawn finer in the opposite direction. Three figures.

## Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad. Summaries of some of the more important of these patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** FOSTER and POCKLINGTON [Variable-speed dynamo control] 3,105/12; COOPER [Resistance manufacture] 3,325/12; TURNER [Insulating of apparatus] 5,856/12; LEITNER [Variable-speed dynamo control] 11,175/12; DIAZ and AZAROLA y GRESILLON [Preventing theft of electrical energy] 11,259/12; SMITH and SCHUTER [Covering conductors with plastic material] 22,534/12.

**Dynamos and Motors:** B.T.-H. (*G.E.C., U.S.A.*) [A.C. motors] 9,210/12; PINTSCH'S ELEC. MFG. Co. and VIDAL [Brush holders] 15,471/12.

**Electrometallurgy and Electrochemistry:** BOULT (*Dynamit A.-G.*) [Gas-reaction furnace] 3,342/12; PLAUSON and TRISCHENKO [Electrolytic production of ductile iron] 10,882/12; GES. FÜR ELEKTRO-OSMOSE and ILLIG [Apparatus for electro-osmose] 29,826/12.

**Switchgear, Fuses, and Fittings:** SHELTON (*Sächsische Gruppenwechselschalter*) [Switches and connectors] 3,590/12, and 30,024/12; WYNNE [Switches] 5,462/12; B.T.-H. & GARTON [Electro-magnetic switches] 5,576/12; BYNG and TAYLOR [Conduit fittings] 6,052/12; WILSON and CANDOLITE Co. [Candle lamp-holder] 7,729/12; TROOD and DALE [Connectors] 9,911/12; CURTIS [Regulator] 16,938/12.

**Telephony and Telegraphy:** BROWN [Relays] 27,953/11; HEYLAND [Production of high frequency currents] 3,555/12; SCHIESSLER [Submarine cable and long-distance overhead] 4,061/12; GOLDSCHMIDT [Parallel working of microphones] 15,915/12; TELEPHONFABRIK A.-G. [Secret intercommunication telephones] 16,084/12.

**Traction:** DESCHAMPS [Railways] 3,123/12; KONIG [Indicating position of vehicles on railways] 17,909/12.

**Miscellaneous:** KROPFMAN [Dental engines] 7,643/12.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Distributing Systems:** BROWN, BOVERI [Regulation] 27,069/12. **Electrometallurgy:** HELFENSTEIN [Furnace: electrodes pass through charge container, also details of gas exit] 2,577/13.

**Ignition:** "MAFAM" Motor APPARATE GES. [Magnet] 1,093/13. **Switchgear, &c.:** VON KERCKHOVEN [Dynamo regulators] 1,512/13.

**Telephony:** SIEMENS & HALSKE [Exchanges] 3,132/13. **Miscellaneous:** SMITH [Electrocuting animals] 2,152/12.

The following Amended Specifications may now be obtained. **Incandescent Lamps:** B.T.-H. (*G.E.C., U.S.A.*) [Treatment of tungsten for wire drawing] 21,513/06.

**Telegraphy:** S. G. BROWN [Relays] 20,451/11.

## Amendment to Specification

6,487/12. **Incandescent Lamps.** A. C. HYDE. As a result of the extended investigation under Section 8, this Specification has been amended. It deals with the mounting of continuous filaments (see *ELECTRICAL ENGINEERING*, Vol. VIII., p. 492).

## Opposition to Grant of Patent entered

27,521/11. **Moving Targets.** J. B. LE MAITRE. The target is stopped on the shot being fired by a relay controlled either by the sound-waves due to the firing or else by the circuit of a wireless transmitter being completed by the movement of the trigger of the gun, the waves so emitted striking a detector in the relay circuit. A special screen is also described.

## Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

**Distributing Systems, Cables and Wires, &c.:** T. HARDEN and AMALGALINE, LTD. [Joining lead-covered cables] 25,845/06.

**Dynamos and Motors:** M. WALKER [Rotary field magnet design to keep field coils in position] 24,351/04; B.T.-H. (*G.E.C., U.S.A.*) [Reducing pressure between adjacent commutator segments in high-speed machines with multiplex windings] 24,992/07; [Core construction for compensating windings, &c.] 25,116/07; A. SCHERBIUS [Speed control of asynchronous motors, keeping a high-power factor] 25,305/07.

**Electrometallurgy:** W. EVANS (*A.E.G.*) [Welding] 25,272/07. **Ignition:** ELECTRIC IGNITION Co. and F. H. HALL [Tremblers for induction coils] 25,770/06.

**Traction:** E. W. TIMMIS [Electro-magnetic point and signal mechanism] 22,808/01; W. R. SYKES [Cutting in or out an intermediate signal cabin] 24,607/03; B.T.-H. (*G.E.C., U.S.A.*) [Switch for motor of semaphore signal] 24,993/07; E. H. COCKSHOTT [Electro-magnetic track brake] 25,026/07.

## LOCAL NOTES

**Chatham: Street Lighting.**—The new street electric lighting scheme which has been carried out by the Kent Electric Power Co. was inaugurated last week.

**Darwen: New Plant.**—A new 1,250-k.v.a. 3,000-volt steam turbo-alternator which has been installed at a cost of £5,250 was started up by the Mayor last week. The set has been supplied by Messrs. Dick, Kerr and Co. The installation of this plant has involved the ordering of a 300-kw. static transformer and a 300-kw. rotary-converter, which have been supplied by the British Westinghouse Co.; a 200-k.v.a. motor-generator, which has been supplied by Dick, Kerr and Co., and a new high-tension switchboard, supplied by Messrs. Ferranti, Ltd.

**Dundee: New Supply Station.**—The Dock Street Supply Station is now completed, and is capable of relieving the Dudhope Crescent Road station to the extent of 1,500 kw. Specifications have been issued for the steel-work and chimney for the extensions at the power station, Carolina Port.

**Eton: Electric Cooking.**—Some remarkable figures were produced at the last fortnightly meeting of the Board of Guardians in relation to the saving made in the use of electricity for electric cooking and electric lighting. When gas was used for lighting and cooking the total annual cost was £228, whereas since electricity has been installed for both these purposes the total cost has been reduced to £78, showing a total saving of no less than £149. Further, it is the emphatic opinion of all concerned that the lighting and the ventilation in all the buildings has improved very considerably. The above figures, by the way, represent to some extent the use of carbon filament lamps, so that a considerable further saving may be anticipated when the use of metal filament lamps becomes general.

**London: Supply to Olympia.**—The Fulham and Hammersmith Borough Councils have entered into an agreement for seven years under Section 3 of the London Electric Supply Act, 1908, whereby a separate duplicate system of lighting by electricity will be provided for Olympia. For the purpose of giving this supply, the Fulham Council will lay a cable, supply a feeder-box belonging to the Hammersmith Council, from which point the latter will lay the duct to their substation in Olympia, the necessary cable being laid in it by the Fulham Council. The supply will be single-phase, A.C., at 2,800 volts, and the Hammersmith Council will pay the Fulham Council 2d. per unit, measured at the Olympia substation, the minimum payment being £100 per annum.

**Sunderland: Obsolete Plant.**—A special meeting of the Electricity Committee is to be called to consider tenders for the purchase of the obsolete machinery at the Dunning Street power station. As notified in our advertisement columns a few weeks back, the Corporation are desirous of selling the whole of the plant at Dunning Street.

**York: Lighting Tariff.**—As from March 31st, the flat rate for lighting supply will be 8½d. per unit up to 4,000 units per quarter, with special arrangements for supplies in excess of that quantity.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

[Notes of Contracts Open are not repeated under this heading week by week until the last date for receiving tenders, but are only inserted once.]

## Generating Stations, Sub-Stations, Mains, &amp;c.

**Aylesbury.**—The question of electric supply is receiving considerable attention. The Council obtained a provisional order in 1899, but this, together with another obtained subsequently, was revoked by the Board of Trade because the Council could not make up its mind how to proceed. A further order has since been granted, but the position seems very much the same now. A poll of the town, however, has been taken with the result that 1,452 votes were accorded in favour of the Council undertaking the scheme and 439 against.

**Barking.**—The Electrical Engineer has been instructed to prepare a report upon extensions at the generating station.

**Bispham.**—A Local Government Board inquiry has been

held concerning a loan of £8,178 for the Council's electricity undertaking.

**Bombay.**—Bombay and Baroda Railway Co. Transformer and motor-generator. March 14th. London Office, 110 Bishopsgate, E.C.

**Bridgend.**—Steam alternator. Borough Electrical Engineer. March 21st.

**Darwen.**—A loan for a cable at an estimated cost of £1,700 is to be applied for to supply the Darwen Spinning Company's mill.

**Egypt.**—Diesel-engine-driven pumping station at Baltim. Sir A. L. Webb, K.C.M.G., Queen Anne's Chambers, S.W.

**Fleetwood.**—An extension scheme involving an expenditure of £7,170 has been inquired into.

**Galashiels.**—Mr. T. C. Parsons, late Burgh Electrical Engineer at Govan, has been retained to report as to an electric lighting installation here.

**Haslingden.**—Loans of £3,750 and £1,500 have been granted for cables and services.

**Hastings.**—A Local Government Board inquiry has been held regarding loans of £4,000 for plant; £500 meters; £1,500 services; £500 transformers, and £1,600 for certain alterations of plant at the electricity works.

**Huddersfield.**—Two boilers, economiser, steam pipes, &c. Borough Electrical Engineer.

**London: Hampstead.**—A loan of £4,100 is to be taken up for extensions.

The Finance Committee of the L.C.C. have sanctioned a loan of £10,483 for electrical extensions.

**Islington.**—The Finance Committee of the L.C.C. have sanctioned loans of £5,500 and £8,486 for mains and transformers.

**Newport, Mon.**—The Borough Electrical Engineer recommends capital expenditure upon new plant and alterations to existing plant amounting to £12,794.

**Nottingham.**—Following the recent report as to the inadvisability of attempting to use some local water-power for generating electricity, the Corporation are proposing to install an exhaust steam turbine at the St. Anne's Well Road generating station.

**Shipley.**—A £14,000 extension scheme has been reported upon by the Electrical Engineer.

**Swinton.**—One 25-kw. transformer and switchboard; also mains. Clerk. March 10th.

**York.**—One 3,000-kw. turbo-alternator with condensing plant and switchboard; two water-tube boilers, &c.; storage battery; high-tension cables. City Electrical Engineer. March 10th.

## Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

**Ashton-under-Lyne.**—£30,000 extensions to infirmary.

**Cardiff.**—Technical Institute. Cathays Park. Director of Education, City Hall.

**Glasgow.**—New factory, Earl's Park. Messrs. Wallace, Scott and Co.

**Llandudno.**—Proposed enlargement of Assembly Room. Town Hall.

**London: L.C.C.**—178 lighting points at Victory Place elementary school, Walworth. March 19th. Chief Engineer.

**Newcastle-on-Tyne.**—New baths.

**North Shields.**—Extensions at Nurses' Home. Architect, W. Stockdale, 81 Howard Street. March 12th.

**Portsmouth.**—Mr. R. J. Wallis-Jones is advising the Guardians with regard to an electric lighting installation.

**Prestatyn.**—Electric heating installation, Victoria Hall. Mr. Box.

**Rochdale.**—Headquarter buildings for Territorials. Surveyor, East Lancashire Territorial Association, Town Hall Chambers.

**Stockport.**—New Grammar School. Architect, R. H. Spalding, 36 and 37 King Street, London, E.C.

**Swindon.**—County Police Station. Surveyor. March 10th.

**Wigan.**—Proposed new girls' high school.

## Miscellaneous

**Birmingham.**—Additional tramway rolling stock. General Manager. March 11th.

**Heston and Isleworth.**—A twelve months' supply of stores for Electricity Department. Borough Electrical Engineer. March 8th.

**Liverpool.**—A twelve months' supply of electrical fittings for premises of Liverpool Select Vestry. Clerk, Parish Offices, Brownlow Hill.

**London: War Office.**—Firms desiring to tender for cables, electrical stores, scientific instruments, &c., are requested to communicate to the Director of Army Contracts. No application is necessary from firms whose names are already on the War Office lists.

**L.C.C.**—The estimated cost of the construction of the tramways from Catford to Southend is £61,510, and it is proposed to put the work in hand at once.

**South Shields.**—A twelve months' supply of stores for the electricity undertaking. Borough Electrical Engineer. March 10th.

**Swinton.**—A twelve months' supply of stores for Electricity Department. Clerk. March 10th.

## APPOINTMENTS AND PERSONAL NOTES

Dr. A. R. Forsyth, late Sadlerian Professor of pure mathematics at Cambridge, has been appointed Chief Professor of Mathematics at the Imperial College of Science and Technology, South Kensington.

A recommendation has been made that the salary of Mr. W. Fennell, the Borough Electrical Engineer at Wednesbury, should be increased by £25 per annum.

The salary of Mr. J. H. Bowden, Borough Electrical Engineer at Poplar, has been increased from £600 to £700 per annum.

Mr. C. W. Bentley, at present Assistant Manager of the Musselburgh Electric Tramways Co., has been appointed in succession to Mr. A. A. Watkins, who has received an appointment in the Colonies.

Mr. P. Taylor has been appointed to succeed Mr. J. Boyce as Chief Assistant Engineer to the Darwen Electricity Works, Mr. Boyce having gone to Todmorden.

Mr. Justice Parker, who is well known to our readers in connection with many important electrical patent cases, and who is also Chairman of the Special Committee now investigating wireless telegraph systems, has been appointed a Lord of Appeal, to succeed the late Lord Macnaghten.

The following increases of salaries in the York Electricity Department are recommended:—Mr. J. W. Hame, City Electrical Engineer, from £500 to £550; Mr. E. J. Nichols, Chief Assistant Engineer, £170 to £180, maximum £200; Mr. T. R. Stancombe, Installation Superintendent, maximum £150.

## TENDERS RECEIVED AND ACCEPTED

**Birmingham.**—The contract for the supply of "Tantalum" Traction lamps for the lighting of the Corporation tramcars has been placed with Messrs. Siemens Bros. Dynamo Works. It is anticipated that some 20,000 lamps will be required.

**London: L.C.C.**—The following tenders have been received for rotary converters at the Shoreditch sub-station: Dick, Kerr and Co., £8,022; British Westinghouse Co., £8,713; General Electric Co., £9,145 10s. The estimate of the Chief Officer was £7,300, and the tender of Dick, Kerr and Co. is recommended for acceptance.

The following tenders have been received for the wiring of the Camberwell and Cressy Road car sheds: Williams and Bach, £2,139 11s.; Electrical Installations, £2,146; G. E. Taylor and Co., £2,314 11s.; G. Weston and Sons, £2,572 4s. Lund Bros. and Co., £2,623; Leonard G. Tate and Co., £2,682 14s.; Tilley Bros., £2,696 13s.; W. C. Tackley and Co., £3,077 17s. The tender of Williams and Bach is recommended for acceptance.

The tender of Siemens Bros. Dynamo Works at £7,800 has been accepted for 125,000 drawn-wire metal filament traction lamps. The Council also invited tenders from the General Electric Co. and the British Thomson-Houston Co., both of

whom quoted £10,237 10s., and Siemens Bros. Dynamo Works also put in an alternative tender at the same price.

The following tenders have been received for 880 yds. of high-tension cable: Siemens Bros. and Co., £248 5s.; W. T. Henley's Telegraph Works, £251 15s.; Western Electric Co., £251 15s.; British Insulated and Helsby Cables, Ltd., £253 6s.; W. T. Glover and Co., £254 2s. Messrs. Siemens Bros. and Co.'s tender has been accepted.

**Hammersmith.**—A contract has been placed with Messrs. Chamberlain and Hookham for all sorts of A.C. meters from 3 to 500 amperes.

**Rochdale.**—For the extensions at the electricity works the following tenders are to be recommended for acceptance: turbo-alternator, W. H. Allen, Son and Co.; steam turbo-alternator, J. Howden and Co.; motor-alternator, General Electric Company.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith and Son, 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £69 to £69 10s. (last week, £68 to £68 10s.).

**Long Life of a Metal Filament Lamp.**—The British Westinghouse Co. send us a copy of a letter from a customer stating that a 50-c.p. 220-volt Auriga lamp has been in use for about eighteen hours a day since February, 1910, that is, about 20,000 hours, and is still running.

**Change of Address.**—The Dictaphone Co. (late of 195 Oxford Street, W.), have moved into commodious offices and showrooms at Kingsway House, Kingsway, W.C.

**Staff Ball.**—The annual staff ball of Bruce, Peebles & Co. was held at Edinburgh on Friday last. The opportunity was taken of presenting Mr. Lee Murray, who has just retired from the position of general manager, with an illuminated album, signed by about 700 members of the staff and works.

## COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &amp;c.

**Waste Heat and Gas Electrical Generating Stations.**—A dividend of 8 per cent. for the year has been declared. The company's new stations at Port Clarence and Ayresome were finished during the past year, and another at Bowden Close was put into operation in September. The directors have under consideration the erection of further plants in their district.

**County of London Electric Supply Company.**—A final dividend making 6 per cent. for the year has been declared.

**W. T. Henley's Telegraph Works.**—At the annual meeting last week, Mr. George Sutton, the Managing Director, said that last year's turnover represented the largest in quantity that the Company had ever had. Quite a satisfactory feature was that this was not due to any abnormal contracts. With regard to orders on the Company's books, one was for the construction and laying of the cables for the electrification of a portion of the Central Argentine Railways, and it amounted to nearly £100,000. This was the largest order of its kind that had ever been placed.

**British Electric Transformer Co.**—Very satisfactory progress was reported at the annual meeting last week, when Mr. A. F. Berry presided. The volume of work done in 1912 was considerably in excess of that turned out in 1911, and particularly has the foreign and colonial work increased. Some 28 supply authorities are now hiring out "Tricity" cookers.

**Bruce Peebles & Co.**—At the annual meeting last week Mr. F. E. Andrews, who presided, said that the loss on the year's working, already referred to in these columns, was more apparent than real, and did not affect the cash position to any appreciable extent. During the course of his speech he made some strong comments upon the effect of the National Insurance Act and the general tendency of present-day legislation, which, he said, was placing burdens upon industry, and it was difficult to see what recompense, either direct or indirect, manufacturers could possibly derive from it.

**The Strike at Evershed and Vignoles' Works.**—This strike, which arose out of the dismissal of a workman for reading instead of going on with his work, has been settled by the withdrawal by the men of the demand for his reinstatement. The company has undertaken to take back the strikers into its employ.

## SUMMARY

A PAPER by Mr. S. L. Pearce and Mr. H. A. Ratcliff, before the Institution of Electrical Engineers, dealt with the successful trials of electric street lighting in competition with high-pressure gas at Manchester, and described some effective experiments with graded frosting of globes for the purpose of improving the uniformity of illumination. Several interesting points were raised in the discussion in London: the enormous saving in labour by the use of lowering gear, the false economy of cheap carbons, the reasons for the enormous

discrepancy between rated and actual candle-powers of high-pressure gas lamps, and the question of dioptric globes. The Paper has also been discussed at Manchester. (Page 146.)

OUR "ELECTRICAL ENGINEERING Literary Section" contains a list of new publications, reviews of a number of technical books, and gives a selected list of recommended works on all branches of electrical engineering. (Page 143.)

A PROBLEM in connection with efficiencies of gearing is discussed in our "Questions and Answers" columns. (Page 149.)

A CONVENIENT form of bench electric grinder, an incandescent lamp with a diffusing globe, and a new semi-indirect lighting fitting are described in short illustrated articles. (Pages 150.)

THE Marylebone Borough Council have passed recommendations for the purchase of converters, condensers, pumps and switchgear for their three-phase extensions. The new steam turbine plant, which will have a steam economy 35 per cent. in excess of that of the existing machines, installed six years ago, will be used for the bulk of the load, the continuous-current plant being employed only on peak and as reserve. (Page 151.)

AMONG the subjects dealt with in the specifications published last week by the Patent Office are train or car lighting dynamos with cut-out switches worked by the main field; a system of automatic driverless railways by J. J. Deschamps; a high-frequency generator invented by A. Heyland; and a variable-speed A.C. motor with shifting brushes patented by the B.T.-H. Co. (Page 152.)

SERIOUS corrosion of the rails and overhead construction has been experienced in the Simplon tunnel. We also refer in our "Electric Traction Notes" to some further schemes of electric traction in Switzerland, and to opinions expressed in Germany on the Melbourne electric traction scheme. (Page 153.)

THE Bognor electric lighting scheme is being proceeded with, and supply is to be available in July.—A protest has been made against the allocation of £1,200 from electricity profits to relief of rates at Swansea.—In view of the adverse balance on the past year's working, the price of current is to be increased at Walsall.—An inquiry is being held into an application by the Corporation and the Gas Co. for a Provisional Order at Truro. (Page 153.)

LOANS are to be applied for at Bristol (£25,000); Colchester (£7,660); Peterborough (£7,000); Walsall (£4,840); Stoke-on-Trent (£4,570); and Wigan (£3,000).—Additional generating plant is to be installed at Southampton.—A loan of £8,052 for extensions has been sanctioned at Darlington. (Page 155.)

## ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, MARCH 13TH.

*Institution of Electrical Engineers.*

8 p.m. "The Power Supply on the Rand," by A. E. Hadley.

*Institution of Electrical Engineers: Dublin Section.*

8 p.m. At Royal College of Science. "Recent Developments in the Application of Electricity to the Textile Trades," by S. F. Crowley.

FRIDAY, MARCH 14TH

*Physical Society of London.*

5 p.m. At University College, Gower Street. The Papers down for reading include "Some Oscillograms of Condenser Discharges and a Simple Theory of Coupled Circuits," by Professor J. A. Flemming, who will also give an exhibition of Braun Cathode-Ray Tubes.

*Institution of Electrical Engineers: Students' Section.*

7.30 for 8 p.m. At "Tricity House Restaurant. Informal Dinner.

*South-Western Polytechnic Institute, Chelsea.*

8 p.m. Presentation of prizes and certificates by Sir Alfred Cripps. At 9.15 p.m. the building will be open to public inspection.

SATURDAY, MARCH 15TH.

*Batti-Wallahs Society.*

Annual Dinner.

MONDAY, MARCH 17TH.

*Institution of Electrical Engineers: Newcastle Students.*

7.30 p.m. At Armstrong College. "Regulation of Pressure and Continuity of Supply of Electricity under various Aspects," by E. Wyatt.

TUESDAY, MARCH 18TH.

*Institution of Electrical Engineers: Manchester Students.*

7.30 p.m. At Municipal School of Technology. Annual General Meeting.

*Institution of Electrical Engineers: Scottish Section.*

8 p.m. At 207 Bath Street, Glasgow. "Recent Developments in the Street-Lighting of Manchester," by S. L. Pearce and H. A. Ratcliff.

*Institution of Civil Engineers.*

8 p.m. At Institution of Mechanical Engineers. Further discussion on "Notes on City Passenger-transportation in the United States," by G. D. Snyder.

WEDNESDAY, MARCH 19TH.

*Association of Mining Electrical Engineers:  
North of England Branch.*

Paper by F. Milburn.

## The London Electrical Engineers.

(TO-DAY) THURSDAY, MARCH 13TH. C. Company.—Recruit Training, 7 to 10 p.m.; Company Training, 7 to 10 p.m.

FRIDAY, MARCH 14TH. D. Company.—Company Training, 7 to 10 p.m.

SATURDAY, MARCH 15TH. Headquarters opened for Regimental business from 10 a.m. till 12 noon.

MONDAY, MARCH 17TH. A. Company.—Recruit Training, 7 to 10 p.m.; Company Training, 7 to 10 p.m.

TUESDAY, MARCH 18TH. B. Company.—Company Training, 7 to 10 p.m.

THURSDAY, MARCH 20TH. Easter Camp.—Parade at Headquarters at 12.45 p.m.

C. Company.—Recruit Training, 7 to 10 p.m.; Company Training, 7 to 10 p.m.

FRIDAY, MARCH 21ST. D. Company.—Company Training, 7 to 10 p.m.

SATURDAY, MARCH 22ND. Headquarters open for Regimental business from 10 a.m. till 12 noon.

**Fire.**—A somewhat serious fire occurred at the Sphere Engineering Works of Engineering and Arc Lamps, Ltd., St. Albans, on Saturday night. The alarm was given by one of the employees at the North Metropolitan Electric Supply Station next door, at nine o'clock. The cause of the outbreak has not been discovered. The fire apparently originated at the south-east corner of the building, and three gables were completely burnt out for two-thirds the length of the works, and the coil-winding department was also completely destroyed. The shafting was much injured, but damage to the machinery is not extensive, the principal loss being suffered by finished stock and raw material. The damage to the stock, building, and contents is about £4,000, which is fully covered by insurance. It is hoped to have all the machines, &c., working within five weeks, and although part manufacture has already been resumed, yet the company request the indulgence of clients for delays in delivery.

**Institution of Electrical Engineers: Western Section.**—At the Annual General Meeting, which was held on Monday last at Cardiff, Mr. H. Faraday Proctor (Engineer and General Manager, Corporation Electricity Dept., Bristol) was elected Chairman and Mr. D. E. Roberts (Cardiff) Vice-Chairman. The following were elected to seats on the Committee, from which Mr. A. Ellis (Tramways Manager, Cardiff) has found it necessary to resign:—Prof. D. Robertson (Merchant Venturers' Technical College, Bristol), Messrs. H. D. Munro (City Electrical Engineer, Exeter), E. G. Okell (Borough Electrical Engineer, Plymouth), F. Tremain (Superintending Engineer P.O. Telegraphs, Bristol), A. J. Newman (Mains Superintendent, Bristol), A. B. Randall (Resident Engineer, Salisbury Electric Light and Supply Co., Ltd.), and W. A. Scott (Cardiff).

There would be less risk of accident if Mr. Pearce and Mr. Bailey were to charge more nearly in parallel.

## RECENT DEVELOPMENTS IN THE STREET LIGHTING OF MANCHESTER

OUR readers have already been made acquainted with the "experimental" street lighting recently carried out in Manchester, and the competition between gas and electric street lighting in that city (ELECTRICAL ENGINEERING, March 7, 1912, p. 115, and Oct. 31, 1912, p. 594).

In a paper presented to the Institution of Electrical Engineers, Mr. S. L. Pearce (City Electrical Engineer, Manchester) and Mr. H. A. Ratcliff have given some further particulars, describing, particularly, experiments carried out with the globes of the arc lamps in order to obtain the greatest possible uniformity of illumination.

It will be remembered that the arc lamps are 550-watt flame arc lamps, mostly centrally hung from span wires; they were originally placed 28 ft. from the ground, but the height was reduced to 27 ft. 6 in. The former of the two articles mentioned above described and illustrated the initial

FIG. 1.

Tests with the First Experimentally-obscured Globes.

change made in the spinnings and the shape of the globes so as to obtain more uniform lighting, and the curves which we now give show the results of the further experiments described in the paper. The photometric measurements were carried out on the lamps in the streets and a flicker photometer was employed.

In taking the tests the authors found incidentally that the high-pressure gas lamps gave a steadier light than the arc lamps, but, although this was very noticeable in the flicker photometer, it could hardly be detected with the naked eye. On the other hand, it was found that the gas lamps varied enormously in candle-power from day to day, and the candle-power of a particular three-light lamp might vary at least 50 per cent. before the mantles were renewed. Among other disadvantages of the gas lamps were (a) extensive and highly dangerous leakage of high-pressure gas; (b) the detrimental effect of a foggy or heavily smoke-laden atmosphere on the mantles, resulting in a serious diminution of candle-power just at a time when it is most required; (c) partial and occasionally complete failure in frosty weather; and last, but not least, as shown by the figures already published, the cost of the gas lighting was by far the greater.

FIG. 2.

Tests with the Latest Type of Outer Globe, having a Graded Frosting.

The reports by Mr. Haydn Harrison and Mr. Abady, already published, very closely confirmed the values of candle-power and illumination claimed by the Corporation Electricity Department as a result of the tests made by their own staff, and both series of tests showed that the gas lamps were not giving anything like the candle-power claimed by the manufacturers.

This latter result is by no means an isolated one, for the authors give figures of tests of other high-pressure gas lamps in which similar enormous discrepancies, amounting to 50 per cent. are apparent between the rated and actual

candle-powers. Tests with a luminometer also established without question the greater penetrative power of the light from the arc lamps in foggy weather.

We now come to the part of the paper dealing with the experiments and tests made in connection with the arc-lamp globes, which are of considerable interest, and importance. Figs. 1 and 2 may be compared to show the advantages obtained by the graded frosting of the globes, to be described later. Both figures relate to the lamps in Portland Street, Manchester; the full-line curves in both represent illumination on a horizontal plane 8 ft. 3 in. above ground level, the dotted curves are for the illumination on a vertical plane, and the chain-dotted curves the illumination on the ground. The shadows immediately under the lamps, due to the ash trays, are clearly indicated in Fig. 1, and their absence in Fig. 2. By the original alteration in the spinnings and the shape of the globe in the lamps in Portland Street, the candle-power at  $20^\circ$  below the horizontal was enormously increased, but it may be mentioned that the shape of the polar curve and the value of the candle-powers so obtained was very similar to that from the lamps of a different make used in Piccadilly; polar curves of the latter are shown in Fig. 3. Fig. 4 shows the polar curve for the 11-ampere lamp fitted with the clear inner and outer globes. This curve possesses many excellent features, but at the same time, the authors remarked, it can be modified with considerable advantage according to the class of work for which the lamp is intended to be used. For street-lighting work,

FIG. 3.

Polar Curve for 550-watt Flame Arc Lamp, as used in Piccadilly.  
a. With Clear Globes.  
b. With Slightly Opalescent Outer Globes.

FIG. 4.

Polar Curve for 550-watt Flame Arc Lamp, as used in Portland Street. (The dotted portion shows the effect of original experimental obscuration.)

the upper portion of the curve between  $15^\circ$  and  $25^\circ$  from the horizontal is of most importance, but the portion between the  $40^\circ$  and  $65^\circ$  rays could be reduced with advantage. The absence of appreciable candle-power between  $80^\circ$  and  $90^\circ$  is a result of the rather pronounced shadows cast by the ash-trays. The first attempt to reduce the distribution of light between the  $40^\circ$  and  $65^\circ$  rays, and at the same time to improve the distribution in the neighbourhood of  $20^\circ$  below the horizontal, was by the use of dioptric globes. The results were not entirely successful, and seemed to demonstrate a rather objectionable feature of dioptric globes, namely, the strongly defined optical centre, in consequence of which the light distribution is very considerably distorted if there is any appreciable change in the arc position. Attempts were then made to modify the shape of the polar curve by suitable obscuration of the outer globes. The necessary obscuration was at first obtained by the application of whitening on the inside of the lower portion of the outer globe, and the results obtained were rather remarkable. Unfortunately, owing to the nature of the obscuration, it was a very difficult matter to do two or more globes exactly alike, and consequently reliable test figures were only obtained with considerable difficulty. Owing to the comparatively opaque and very materialistic nature of the obscuration, the effect was merely to cut down the light between the  $40^\circ$  and  $80^\circ$  rays, there being otherwise very little diffusion or alteration in the shape of the polar curve, although slight traces of reflection were apparent which had the effect of improving somewhat the candle-power nearer the horizontal. The shadows under the lamps were not greatly reduced. There was a very great improvement in the curve of illumination on the horizontal plane, and the glare was appreciably reduced. Globes obscured in this manner have actually been in use in Portland Street for over six months. Endeavours were then made to obtain from the globe-makers suitably obscured globes, but the greatest difficulty was experienced in obtaining exactly what was required. Apparently the

makers were able to supply globes completely opalescent, sand-blasted, or acid-etched, and even globes so treated on only a portion of their surface; but no manufacturer would undertake to give a graded effect, at any rate on a diffracting globe, although a flashed opalescent globe with a graded effect on the lower portion was eventually obtained.

The experimental etching of globes was therefore undertaken. The process employed was very simple. The globes were clamped on to a special lead stand and filled to the desired height with the etching acid. The grading effect

FIG. 5.

Polar Curves for 550-watt Flame Arc Lamp.

a. With Clear Outer Globe, having a Dense Frosting on the Lower Portion, extending up to about 40° from the horizontal.  
b. With Clear Outer Globe, having a Graded Flashing on the Lower Portion, the Flashing being Densest at the Bottom.

FIG. 6.

Polar Curve for 550-watt Lamp, fitted with Clear Globes, and having a Graded Frosting on the Lower Portion of the Outer Globe. The Frosting is Densest at the Bottom of the Globe, and disappears at an angle of about 40° below the horizontal.

was then obtained by allowing the acid to run out of the globe through an adjustable orifice in the lead stand, and any desired degree of frosting could be obtained by regulating the rate of flow.

Figs. 5, 6, 7 and 8, which are explained by their foot-lines, show a variety of polar curves obtained with different combinations of globe, and it is obvious that Nos. 7 and 8 are very suitable for giving a fairly uniform illumination on a horizontal plane.

Experiments were also made in equipping the lamps with enamelled iron reflectors of various shapes, but the results were not very successful from the point of view of the distribution of the light. One objection to the use of reflectors is the dark shadows cast above an angle of about 80° to the vertical, as a result of which the blackness of the buildings and the darkness above the lamps is very much intensified. This is particularly noticeable in foggy weather. It is very evident from the results, the authors concluded, that the most satisfactory curves of light distribution are obtained either with suitably frosted outer globes, or with dioptric inner globes used in conjunction with partially opalescent outer globes. There is very little to choose between the two methods on the score of light distribution. The dioptric globes undoubtedly have a slight advantage in this

FIG. 7.

Polar Curve for 550-watt Lamp, with Dioptric Inner Globe, and the same Outer Globe as for Fig. 5 (a).

FIG. 8.

Polar Curve for 550-watt Lamp, with Dioptric Inner Globe, and the same Outer Globe as for Fig. 5 (b).

respect, but when it comes to the consideration of general advantages and disadvantages, there is much to be said in favour of the partially frosted outer globes. They are comparatively inexpensive to produce, and the degree of frosting may be easily varied or graded as required; they have no optical centre, and consequently slight relative displacement of globe and arc is of no serious consequence; the intrinsic brilliancy of the light source is considerably reduced with a corresponding reduction of the glare effect, provided that the lamps are fixed sufficiently high; shadows under the lamps are entirely eliminated, and the sharpness of the shadows cast by objects is toned down very considerably; and finally, with dioptric globes, a completely uniform distribution of light does not appear to be obtainable without the use of special outer globes.

#### DISCUSSION IN LONDON ON MARCH 6TH.

Mr. A. H. SEABROOK (Chief Electrical Engineer, Marylebone) fully agreed with the use of centrally-hung lamps, but favoured the use of lowering gear rather than tower wagons. During the past 18 months the Oxford Street lamps had been changed from tower-wagon trimming to lowering gear, and the cost of the lowering gear had been practically wiped out by the saving of labour in about 18 months. An appendix to the Paper, giving an analysis of costs, allowed 0.2d. per lamp-hour for carbons; Mr. Seabrook endorsed this figure, as he had tried using a carbon which cost 0.16d. per lamp-hour, and had proved to be false economy. He asked whether the Authors' figure of cost, £6 per kw. connected, plus 0.232d. per unit metered, was intended to cover profit, and pointed out one or two directions upon which the estimate was on the safe side, so that possibly a price of between £5 and £4 per kw. might be more correct.

Mr. HAYDN T. HARRISON said that one of the reasons that the high-pressure gas was so absolutely out of court was that in Manchester they were working at a lower pressure than in London; if they had used the same pressure as in London they would have saturated the sub-soil with so much gas that there would have been objections from all directions. That was the reason of the difference between 27 candle-power per c. ft. of gas at Manchester and nearly 50 candle-power per c. ft. in London (Regent Street, Victoria Street, &c.). Dr. Bloch, an eminent German authority in Germany, had stated in his recent book that with high-pressure gas-lighting, at the present moment it was possible to obtain 25.5 candles per c. ft. horizontally (18 spherical and 16 mean hemispherical). The minimum illumination aimed at for the Manchester electric lighting, viz., 0.5 foot-candles horizontal, was higher than was necessary in towns of lesser importance. Finally, Mr. Harrison said that there was less glare from the flame arcs than high-pressure gas; the high-pressure gas lamps in Regent Street (London) gave nearly 3,000 candle-power in 9 sq. ins., which was an intrinsic brilliancy a great deal higher than with flame arc lamps.

Professor SCHWARTZ chiefly devoted his remarks to matters connected with the design and accuracy of photometers, but also mentioned that experiments made by two of his students, Messrs. Weston and Taylor, confirmed the great variation in the candle-power of the high-pressure gas lamps found by the Authors in Mosley Street, Manchester. For instance, four high-pressure gas lamps on a 5 ft. plane showed a maximum illumination of 2.55, 3.4, 4.55, and 6.5 foot-candles from each lamp respectively.

Mr. FRANK BAILEY (Chief Electrical Engineer to the City of London Electric Lighting Company) complained of a remark made by Mr. Harrison to the effect that the results of experimental work of a similar nature in the City of London had not been published, and pointed out that they had been published in the technical Press (ELECTRICAL ENGINEERING, Vol. VI., p. 803, and Vol. IX., p. 20). He did not approve of graded frosting of globes; they should try to avoid interfering in any way with the globe, so as to preserve it as long as possible in the state in which it was received from the makers. It was the greatest difficulty in the world to maintain globes in their original condition for more than a few days in the ordinary city atmosphere, and therefore they should not start by treating the globes in a manner which only assisted trouble from dirt. His experience with dioptric globes had been far more favourable than that of the Authors. Incidentally, he mentioned that the dioptric globe was the outcome of a very brilliant piece of work by Mr. Trotter, who never seemed to get the credit for its initiation. It was a very difficult matter to get the best theoretical shape in the most practical form, and, as the glass-makers did not care to undertake the expense of making the necessary mould, in the City of London they had had to make the mould themselves. In addition to focussing the rays and making them go in a particular direction, the dioptric globe also shielded the arc from draught, and in consequence he had not experienced the flickering noticed at Manchester. Arc lamps flickered far less than incandescent gas lamps.

Mr. K. EDGECUMBE (Messrs. Everett, Edgcombe & Co.), speaking on the question of the metre height for street tests, said there was a little more in it than the fact that it was a convenient unit. About 18 months ago the German Verband authorised the metre as the height for horizontal illumination measurement in street work, and that was probably the reason which had led to its recommendation as the standard in this country. He suggested some definite or concrete figure. They knew that the arc lamp was better than gas—although, no doubt, gas people had some opinions about that—but the difficulty was to arrive at a comparative figure, that for the purpose of comparing costs of different methods of illumination they might take the average illumination between two lamps and multiply it by the distance, and so obtain a figure of "foot-candle-yards." For instance, he had calculated from the figures in the Paper that the gas lighting gave about 47 foot-candle-yards, and electric light 62 foot-candle-yards. Taking the figures of £5 15s. for 3,000 hours' burning for gas, and £3 5s. for electric light, this worked out to 2s. 6d. per foot-candle-yard for gas and 1s. for electricity per thousand hours' burning. (The report of this discussion will be concluded in our next issue.)

# " ELECTRICAL ENGINEERING " LITERARY SECTION

## NEW PUBLICATIONS

We shall be pleased to post any of the undermentioned works to any address in the United Kingdom, Colonies, or Abroad at the prices given. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203-6 Temple Chambers, Temple Avenue, London, E.C., accompanied by a remittance.

"Elementary Manual on Applied Mechanics," by A. Jamieson. 452 pp. 7½ in. by 5 in.; about 280 figures. (London: Charles Griffin and Co., Ltd.) 10th edition. 8s. 6d.; abroad, 4s.

"A Handbook of Wireless Telegraphy," by J. Erskine-Murray. 442 pp. 8½ in. by 5½ in. 196 figures. (London: Crosby Lockwood and Son.) 4th edition. 10s. 6d. net; abroad, 11s. 4d.

"The Design and Construction of Steam Turbines," by H. M. Martin. 372 pp. 11 in. by 7½ in.; 528 figures. (London: Offices of "Engineering," and Longmans, Green and Co.) 25s. net; abroad, 26s. 4d.

"Spon's Architects' and Builders' Pocket Price-Book and Diary, 1913," edited by C. Young and S. M. Brooks. 808 pp. 6½ in. by 3½ in. (London: E. & F. N. Spon, Ltd.) 2s. 6d. net; by post, 2s. 8d.

"The Gas, Petrol, and Oil Engine," by Dugald Clerk, F.R.S., and G. A. Burls. Vol. II.: The Gas, Petrol, and Oil Engine in Practice. 838 pp. 9 in. by 6 in. About 480 figures. (London: Longmans, Green & Co.) 25s. net; abroad, 26s. 3d.

"Die Funkentelegraphie," by H. Thurn. 128 pp. 7½ in. by 5 in. 58 figures. (Leipzig: B. G. Teubner.) M. 1.25; by post, 2s.

"The New Steam Tables," by C. A. M. Smith and A. G. Warren, with an Introduction by Sir J. A. Ewing, F.R.S. 101 pp. 8½ in. by 5½ in. (London: Constable & Co., Ltd.) 4s. net; abroad, 4s. 4d.

"Design of Polyphase Generators and Motors," by H. M. Hobart. 265 pp. 9½ in. by 6½ in. 125 figures. (New York: McGraw-Hill Book Co.) 12s. 6d. net.

"The Universal Electrical Directory" (J. A. Berly's), 1913. 1,556 pp. 9½ in. by 6½ in. (London: H. Alabaster, Gatehouse, and Co.) 21s.; British and Colonial Sections only, 12s.

"Iron and Steel," by O. F. Hudson, with a Section on Corrosion by G. D. Bengough. 173 pp. 9 in. by 5½ in.; 47 figures. (London: Constable and Co., Ltd.) 6s. net; abroad, 6s. 6d.

"Essentials of Electricity.—Direct Currents," by W. H. Timbie. 271 pp. 7 in. by 4½ in.; 224 figures. (London: Chapman and Hall, Ltd.) 5s. 6d. net; abroad, 5s. 9d.

"Bells, Indicators, Telephones, Fire and Burglar Alarms, &c.," by J. B. Redfern and J. Savin. (Electrical Installation Manual.) 123 pp. 6½ in. by 4½ in.; 85 figures. (London: Constable and Co., Ltd.) 1s. 6d. net; by post, 1s. 7½d.

"Application of Electric Power to Mines and Heavy Industries," by W. H. Patchell. 333 pp. 9 in. by 5½ in.; 95 figures. (London: Constable and Co., Ltd.) 10s. 6d. net; abroad, 11s. 5d.

"The Law Relating to Electric Lighting, Power, and Traction," by the late J. Shiress Will. 4th edition, by W. E. T. Jones. 611 pp. 10½ in. by 6½ in. (London: Butterworth & Co.) 27s. 6d.; British Colonies, 29s.

"A First Book of Electricity and Magnetism," by W. P. Maycock. 351 pp. 7 in. by 5 in.; 162 figures. (London: Whittaker and Co.) 4th edition. 2s. 6d. net; by post 2s. 10d.

"The Baudôt Printing Telegraph System," by H. W. Pendry. 147 pp. 7½ in. by 5 in.; 72 figures. (London: Whittaker and Co.) 2s. 6d. net; by post 2s. 9d.

"The Design of Alternating-Current Machinery," by J. R. Barr and R. D. Archibald. 496 pp. 9 in. by 6 in.; 340 figures and 17 working drawings. (London: Whittaker and Co.) 12s. 6d. net; abroad, 13s. 5d.

"Electrical Machine Design," by A. Gray. 528 pp. 9½ in. by 6½ in.; 317 figures. (New York: McGraw-Hill Book Co.) 17s. net.

"Methods of Measuring Electrical Resistance," by E. F. Northrup. 389 pp. 9½ in. by 6½ in.; 158 figures. (New York: McGraw-Hill Book Co.) 17s. net.

"Reports of the Committee on Electrical Standards Appointed by the British Association for the Advancement of Science." 783 pp. 8½ in. by 5½ in.; 56 figures and

10 plates. (Cambridge: The University Press.) 12s. 6d. net; abroad, 13s. 6d.

"Psychology and Industrial Efficiency," by H. Münsterberg. 321 pp. 8½ in. by 5½ in. (London: Constable and Co., Ltd.) 6s. net; abroad, 6s. 5d.

"La Télégraphie et la Téléphonie Simultanées et la Téléphonie Multiple," by K. Berger. Translated by P. le Normand. 134 pp. 10 in. by 6½ in.; 111 figures. (Paris: Librairie Gauthier-Villars.) 4s. 6d. net; by post, 4s. 9d.

## REVIEWS OF BOOKS

**The Law Relating to Electric Lighting, Power, and Traction.** By the late J. Shiress Will. Fourth edition by W. E. T. Jones. 611 pp. 10½ in. by 6½ in. (London: Butterworth and Co.) 27s. 6d.; British Colonies, 29s.

The period of nearly ten years which has elapsed since the last edition of this work, practically the only generally recognised one on the law relating to electric lighting, power, and traction, has been mainly one of co-ordination and remedying those little omissions from which all legislation suffers, and perhaps electrical legislation most of all. The outstanding piece of legislation, of course, has been the passing of the Electric Lighting Act of 1909, in which many of the anomalies of the existing law were swept away. This has accounted for the fact that in recent years there have been so few private Bills promoted asking for powers which in themselves are applicable to all undertakings, and a large saving of expense has been brought about by their insertion in the general law under which all undertakings have to work. The position of electric supply in London has also been more or less straightened out in regard to the ultimate fate of the supply companies, although the position of the local authorities remains as before, and the ideal of the supply of electricity in London being under a single control will still not be realised without further legislation. The Special Committee of the L.C.C. has no doubt had this matter under consideration. The issue by the Home Office of rules as to the use of electricity in mines and factories has also brought about many interesting changes in the legislative position since the previous edition of "Shiress Will," and the new edition under the editorship of Mr. W. E. Tyldesley Jones, who has been very prominent in recent years both at the Parliamentary Bar and elsewhere, is fully due. Apart from those alterations due to the exigencies of revision and modification, the form of the volume remains unchanged, with the exception that the chapter on "Leakage and Electrolysis" has been deleted, the reason for this being that it is now the settled practice of Parliament not to allow protective clauses in respect of this, as it is felt that the Board of Trade Regulations are sufficient for the purpose. The index to the volume is most complete, and "notes" which give briefly cases and precedents are also comprehensive.

**Electrical Photometry and Illumination.** By H. Bohle. 222 pp. 9 in. by 6½ in. 200 figures. 35 tables. (London: Charles Griffin and Co., Ltd.) 10s. 6d. net; abroad, 11s.

Only those who have lived for a few years in a colony can appreciate the difficult task of a writer who, so domiciled, undertakes to produce a book upon a new and rapidly developing branch of science or of engineering. Prof. Bohle has made this attempt, and has amplified a course of lectures into a text-book on photometry and illumination comparing favourably with others which have appeared on the

same subject. It is primarily intended for second-year engineering students, and the mathematics, though not abstruse, are likely to be rather out of the depth of those who do not keep their integral calculus in working order. The author is one of that school which prefers to deal with flux rather than with candle-power, and, in consequence, the simplest problems are tangled up with  $4\pi$  and integrals. Prof. Bohle is so far out of touch with English and American practice that he calls the unit of illumination the candle-foot, not being aware that it has been superseded by foot-candle by nearly all writers, since, like the metre-kerze in Germany, it yields a consistent and intelligent plural. The candle-metre is said to be termed "lux," but the author forgets that a candle-metre is 0.108 foot-candle, and the Hefner-metre is 0.084 foot-candle. Until this ambiguity is cleared up it is not safe to use the Continental term "lux."

It is suggested that the corrections for influence of atmospheric conditions on the pentane lamp found by Paterson differ from the results of Butterfield, Haldane, and Trotter. There is no disagreement. The former investigator gave a straight line law, true for a normal range; the latter gave a curve for a large range, to which the straight line is an exact tangent.

The treatment of photometers is somewhat academic. Two methods of measuring the angular distribution of the light of an arc against its horizontal ray are described. A ray at about  $40^\circ$  or  $50^\circ$  would be much more practical as a standard. As is usual among mathematical writers, the Rousseau curve is "explained" by integral calculus, and Russell's practical simplification is dismissed in eight lines.

The concluding chapter on illuminating engineering shows that the author has given a good deal of attention to practical applications. Those who like working in flux and lumens instead of candle-power will find many interesting examples. Prof. Bohle is indebted somewhat heavily to the pages of *The Illuminating Engineer*, both for matter and for illustrations, but writing this book in South Africa, he could have found no better collection of material. The index refers to paragraphs, and the illustrations are numbered in a strange and original manner.

#### Application of Electric Power to Mines and Heavy Industries.

By W. H. Patchell. 333 pp. 9 in. by  $5\frac{1}{2}$  in.; 95 figures. (London: Constable and Co., Ltd.) 10s. 6d. net; abroad, 11s. 5d.

The greater part of Mr. Patchell's book, which is founded on a course of lectures at King's College, deals with the various applications of electric power to mines, and a pretty complete survey of the subject is given. The introductory chapter sums up the legislative situation and gives some brief notes on the advantages of electrical working, questions of power supply, &c. One of the best chapters in the book is the second, on cables in mines, which contains a wealth of practical detail illustrated by actual examples, but it is a pity that the all-important subject of mining switchgear should have been included at the end of this instead of being expanded into a separate chapter. In like manner shot-firing, underground lighting, signalling and telephones are crammed into about seven pages at the end of a chapter containing descriptions of various patterns of coal cutter. The section on haulage gears, however, is fuller, and is a happy combination of knowledge of mining conditions and sound mechanical and electrical engineering. Electric winding is also treated in an interesting way and various patterns are described and illustrated. The succeeding chapters on ventilation and air compressing and pumping are also in a style useful both to the electrical man in setting forth the conditions that he has to meet and to the mining man in understanding the capabilities of the electrical side of the plant. Finally we have three chapters entitled, respectively, "Rolling Mills," "Machine Tools and Cranes," and "Electric Welding and Furnaces." Although in these—particularly in the first two—a good sketch is given of the subjects, we should have preferred if they had been omitted and the book devoted entirely to mining matters by expanding the sections which we have mentioned above. From the quantitative treatment which such subjects as ventilation receive, and the practical detail in other parts of the book, we must assume that the book is intended for the engineer actually engaged, or about to be engaged, in carrying out the applications of electric power referred to, but we are bound to say that those turning to electro-metallurgy would find the last chapter very insufficient. Such inequality of treatment of the ground covered, however, does not prevent the work being a good one on an important subject.

**The Design of Alternating-Current Machinery.** By J. R. Barr and R. D. Archibald. 496 pp. 9 in. by 6 in.; 340 figures and 17 working drawings. (London: Whittaker and Co.) 12s. 6d. net; abroad, 13s. 5d.

Although published under the joint names of Messrs. Barr and Archibald, the compilation of this treatise was practically completed by Mr. Barr before his death, but the final preparation for the press and a certain amount of minor revision and correction are due to Mr. Archibald. The book is described as a companion volume to the late author's "Principles of Direct-Current Electrical Engineering," which we remember welcoming on its first appearance as a book in which the practical and the theoretical were happily blended. It is, however, a sequel rather than a companion, as the treatment is distinctly more advanced. Before plunging into the design of alternating-current machinery, there are a few chapters on the functions and properties of insulating materials. Transformers are taken first, and after a general discussion a lucid and straightforward method of design is worked out by the aid of actual examples. In like manner alternators are discussed from various points of view before the design is followed through. We should have expected a larger proportion of the space to be given to turbo-alternators, especially in the section devoted to mechanical construction. The armature winding section contains very clear and useful diagrams, and the treatment of harmonics in E.M.F. waves is most interesting. We notice that the author in common with other modern writers, calls the double frequency harmonic the second harmonic, the triple frequency the third, and so on, instead of following the nomenclature of the older writers on sound, who always called the original frequency the fundamental, the double frequency the first harmonic, and so on. Whatever be the merits of either system, their co-existence can only cause confusion. Various other points of theory and practice are discussed, including a separate chapter on parallel running. The actual process of design is illustrated by a valuable series of drawings of machines, forming folding plates at the end of the book. The final chapters deal with the rotary-converter, but this does not receive quite the fulness of treatment that is found in other parts of the book.

**Design of Polyphase Generators and Motors.** By H. M. Hobart. 265 pp.  $9\frac{1}{2}$  in. by  $6\frac{1}{2}$  in.; 125 figures. (New York: McGraw-Hill Book Co.) 12s. 6d. net.

In the author's own words, the purpose of the present treatise is to set forth the fundamental methods of procedure employed in designing electrical machinery. This purpose is well carried out, and, taken in conjunction with the extensive bibliography of modern papers and specialised subjects, the electrical part of the design is amply covered. The general plan followed in this work was evolved after various methods of procedure had been tried by the author when lecturing on design to students at various technical colleges in London. The first part of the book deals with the design of a large slow-speed alternator, then follow some short notes on the modifications necessary in the design of a turbo machine. Considerable space is devoted to the design of squirrel-cage induction motors, with a few notes on slip-ring motors. The author's remarks on synchronous motors v. induction motors and on induction generators are particularly interesting. All the calculations carried out are done very thoroughly, and a vast amount of comparative data collected by systematically studying finished machines of different makes has been averaged and is given in convenient form so that one can readily obtain design information on standard machinery. A number of practical problems are given as exercises.

**Electrical Machine Design.** By A. Gray. 528 pp.  $9\frac{1}{2}$  in. by  $6\frac{1}{2}$  in.; 317 figures. (New York: McGraw-Hill Book Co.) 17s. net.

To those who require the maximum information on electrical machine design in the minimum space this really excellent book may be thoroughly recommended. The design of direct-current generators and motors, alternating-current generators, synchronous motors, induction motors and transformers, is ably discussed—hardly any problem seems to have been omitted. The principle adopted is to build up the design for a given rating by the use of a few fundamental formulæ and design constants, the meaning and limits of which are well explained. The constants appear to have been compiled from a mass of comparative data collated over a considerable period. There are valuable notes on the properties of insulating materials and grading, as well as on the insula-

tion of high-pressure transformers. A number of vector diagrams are given, together with mathematical investigations into many phenomena. Besides the results so obtained, values obtained from practice are given, so that the mathematical part of the book does not interfere with the remainder, and may be omitted if desired until the reader wishes to undertake a refined investigation into some special problem, when he will find the material at hand. The mechanical stresses likely to occur in different parts of all the machines discussed are gone into, and examples of construction are freely given. A useful feature is a table of all the symbols used, their significance, and the page where they are first introduced.

**Reports of the Committee on Electrical Standards Appointed by the British Association for the Advancement of Science.** 783 pp. 8½ in. by 5½ in.; 56 figures and 10 plates. (Cambridge: The University Press.) 12s. 6d. net; abroad, 13s. 6d.

Following upon Dr. Glazebrook's Kelvin lecture at the Institution of Electrical Engineers, the publication of this series of reprints of the reports of the B.A. Electrical Standards Committee is of particular interest as it covers, of course in greater detail, much of the ground so ably mapped out on that occasion. An introduction by Dr. Glazebrook and Mr. F. E. Smith, of the National Physical Laboratory, sketches the progress of the development of electrical standards, and the actual reports of the Committee, which constitute the body of the book, form a practically continuous detailed history of the subject from the first formation of the Committee in 1862, when there was chaos in electrical standards of measurement, to the report submitted to last year's Dundee meeting of the British Association, which discusses errors of one or two parts in 100,000. It may be noted that the report of the International Conference of 1908 is included as an appendix to the B.A. Committee report of 1909, and the final Order in Council establishing the standards as an appendix to the report of 1910. To all those interested in accurate electrical measurement, much of the work will form interesting and stimulating reading, as well as containing valuable information in a convenient form. Its utility is but little diminished by the fact that much of the quantitative detail has been progressively superseded as higher accuracy has been obtained. These reports reveal to us not only a fine example of the real pioneering research prosecuted by Kelvin and his disciples, but also the wonderful perfection of the work built on this foundation by his followers.

**The Gas, Petrol and Oil Engine.** By Dugald Clerk, F.R.S., and G. A. Bous. Vol. II. The Gas, Petrol and Oil Engine in Practice. 838 pp. 9 in. by 6 in.; about 480 figures. (London: Longmans, Green and Co.) 25s. net; abroad, 26s. 3d.

The long-promised second volume of Dr. Dugald Clerk's work on the gas engine has now appeared, the delay having been entirely due to pressure on the author's time. Dr. Clerk has for this reason found it necessary to invite the collaboration of Mr. G. A. Bous in the preparation of this volume, which deals entirely with the internal combustion engine in practice, its theory and history having received adequate attention in the first volume already published. The present work can in no way be considered a reprint of the older book on the gas engine by this author, as the whole has been entirely re-written and brought up-to-date by the addition of much new matter, as will be seen from the fact that each of the two new volumes is considerably larger than the single earlier one. The development of the gas engine occupies about a third of the volume, and is separated into two chapters comprising the four- and two-stroke types respectively, and much valuable detail of modern developments is given, though there does not appear to be any mention of the new "Duplex" two-stroke engine constructed by Mather and Platt, which was described by Mr. A. E. L. Chorlton in October last, the reason probably being that this work was already in the press at that time. It is unnecessary to detail the contents of the work beyond remarking, that besides the usual features, the subjects of fuels, governors and igniting arrangements are fully dealt with, and that both petrol and heavy oil engines, the latter, of course, including the Diesel engine, receive a very large share of attention. The chapter on marine gas and oil engines covers fifty pages and ranges from descriptions of light petrol engines for motor-boats to the latest Diesel marine practice for ocean-going ships. Much original data as to the work of the authors and others have been culled from the proceedings of the Institutions of Civil, Mechanical and

## NEW and STANDARD BOOKS on ELECTRICAL ENGINEERING

Just Published. Fourth Edition Revised and Considerably Enlarged. 450 Pages with 195 Illustrations. Price 10s. 6d. net.

### Wireless Telegraphy ITS THEORY AND PRACTICE

A Handbook for the use of Electrical Engineers, Students and Operators.

By JAMES ERSKINE-MURRAY, D.Sc.

**TELEPHONY: A Comprehensive and Detailed Exposition of the Theory and Practice of the Telephone Art.** By SAMUEL G. McMEEN and KEMPSTER B. MILLER. 950 pages. 670 Illustrations. Royal 8vo, cloth. 17s. net.

**THREE-PHASE TRANSMISSION.** A Practical Treatise on the Economic Conditions governing the Transmission of Electrical Energy by Underground and Overhead Electrical Wires. By WM. BREW, M.I.E.E. 185 pages, 82 Illustrations. Demy 8vo, cloth. 7s. 6d. net.

**FACTORY ACCOUNTS: Their Principles and Practice.** By EMILE GARCKE and J. M. FELLIS. Sixth Edition, revised and enlarged. Demy 8vo, cloth. 314 pages. 6s. net.

**ELECTRIC TRACTION AND TRANSMISSION ENGINEERING.** By SAMUEL SHELDON and ERICH HAUSMANN. 317 pages. 127 Illustrations. Large crown 8vo, cloth. 12s. net.

**ELECTRIC WIRING, DIAGRAMS & SWITCH-BOARDS.** By NEWTON HARRISON. Crown 8vo, cloth. 5s. net.

**ELECTRICAL & MAGNETIC CALCULATIONS.** By A. A. ATKINSON. Crown 8vo. 9s. net.

**ELEMENTARY ELECTRICAL ENGINEERING.** In Theory and Practice. A Class Book for Junior and Senior Students and Working Electricians. By J. H. ALEXANDER. 220 pages. 181 Illustrations. Crown 8vo, cloth. 3s. 6d.

**A POCKET-BOOK OF ELECTRIC LIGHTING AND HEATING.** By S. F. WALKER. Fcap. 8vo. 448 pages. 270 Diagrams. 7s. 6d. net.

**WIRELESS TELEPHONES: and How they Work.** By J. ERSKINE-MURRAY. Second Edition. 1s. 6d. net.

**DYNAMO, MOTOR, AND SWITCHBOARD CIRCUITS FOR ELECTRICAL ENGINEERS.** A Practical Book dealing with the subject of Direct Alternating, and Polyphase Currents. By WILLIAM R. BOWKER. Second Edition, revised. Medium 8vo, cloth. 109 Diagrams. 7s. 6d. net.

**ELEMENTARY ELECTRICAL CALCULATIONS.** A Manual of Simple Engineering Mathematics. By T. O'CONNOR SLOANE. 314 pages. 43 Illustrations. Crown 8vo, cloth. 9s. net.

**ELECTRICAL ENGINEERING.** A First Year's Course for Students. By TYSON SEWELL, A.M.I.E.E. Fifth Edition, revised, with Additions. Large Crown 8vo, cloth. 460 pages, with 278 Illustrations. 5s. net.

**STANDARD ELECTRICAL DICTIONARY.** By T. O'CONNOR SLOANE. 7s. 6d. net.

**ALTERNATING AND DIRECT CURRENT DYNAMOS.** A Text-Book on their Construction for Students, Engineer Constructors and Electricians-in-Charge. By TYSON SEWELL, A.M.I.E.E. 328 pages. 230 Illustrations. Large Crown 8vo, cloth. 7s. 6d. net.

**ELECTRIC MOTORS: Their Action, Control, and Application.** By F. B. CROCKER and M. ARENDT. 10s. 6d. net.

**ELECTRIC POWER CONDUCTORS.** By W. A. DEL MAR. 9s. net.

**WIRELESS TELEPHONY: In Theory and Practice.** By ERNST RUHMER. Translated from the German by J. ERSKINE-MURRAY. Demy 8vo, cloth. 10s. 6d. net.

London: Crosby Lockwood & Son  
7, Stationers' Hall Court, E.C., & 5, Broadway, Westminster, S.W.

Automobile Engineers, to which due acknowledgement is made, and this feature, with the author's comments and additions, alone makes the work indispensable to the internal combustion engineer who wishes to keep himself *au fait* with modern practice. The last chapter gives Dr. Clerk's views as to the future of the internal combustion engine, and proves highly interesting reading, and it is instructive to note that he does not hold out much hope of a practical issue in the direction of the internal combustion turbine. The book is excellently printed and illustrated, and we will praise it with faint blame by our only adverse criticism, in suggesting an improvement for a future edition by the insertion of titles under the illustrations as well as the figure numbers, which in most cases are alone given.

**The Design and Construction of Steam Turbines.** By H. M. Martin. 372 pp. 11 in. by 7½ in. 523 figures. (London: Offices of "Engineering," and Longmans, Green & Co.) 25s. net; abroad, 26s. 4d.

Although based on articles which have appeared from time to time on different aspects of the subject in the columns of our contemporary *Engineering*, this work shows no traces of discontinuity or incompleteness, and forms a well-reasoned and at the same time practical study of the steam turbine addressed to the engineer equipped with a moderate mathematical training. The general scheme states in the earlier part of the book some of the more important laws and formulae in a shape convenient for immediate practical application, but proceeds with their demonstrations later "in the belief," as the author says in his preface, "that they will be the more readily followed by the average reader, when he has previously been impressed with the utility of the result." Thus, after setting forth the elementary theory of guide blades and moving buckets, the author describes the functions of the Mollier diagram, explains efficiency ratios, reheat factors, and the use of correction curves, and proceeds at once to outline a method of practical design before completing his theoretical treatment. Mechanical as well as thermodynamic considerations are treated of, and a considerable portion of the latter part of the book is devoted to descriptions of actual examples of the leading types of steam turbine, assisted by a profusion of detail drawings which are a prominent feature of the work. The last chapter, describing the Ljungström turbine, will be read with particular interest in view of the machines of this design that will shortly be tried in this country.

**Foundations and Machinery Fixing.** By F. H. Davies. 152 pp. 6½ in. by 4½ in.; 52 figures. (London: Constable and Co., Ltd.) 2s. net; by post, 2s. 2d.

This little handbook treats in a general yet comprehensive manner of foundations for ordinary electrical plant, and it has been a pleasure to review so well-written a work published at so modest a sum. Generally speaking, foundations are classed into two types—solid and elastic, the former consisting of substantial blocks of concrete carried directly upon either concrete rafts or piling, depending on the sub-surface of the ground, the latter of smaller concrete blocks mounted upon rubber pads, sheets of felt, cork or similar material. The first type of foundation presents usually but little difficulty, only a balancing of dead-weights against the bearing capacity of various kinds of earth, gravel or rock. On very unstable material the earth may require stiffening with piling and an interesting example of such work is given on p. 22 where piles of 150 ft. long were necessary to reach stable ground. Needless to say, very considerable experience is necessary in successfully dealing with such unusual cases. The question of damping down vibrations of high frequency is a very difficult one and generally requires the use of elastic foundations rather than those of a solid type. M. Prache, of Paris, has made a very long study of the problem and his system of rubber pads is briefly described and may become very necessary in the future with the extended use of large high-speed turbines, machines of 5,000 k.v.a. at 3,000 r.p.m. being now proposed as standard types. It is a little difficult to understand why the author has devoted so much space to the description of brick and stonework foundations, as in nearly every case concrete foundations are cheaper, easier to construct, and in every way better.

**The New Steam Tables.** By C. A. M. Smith and A. G. Warren, with an Introduction by Sir J. A. Ewing, F.R.S. 101 pp. 8½ in. by 5½ in. (London: Constable & Co., Ltd.) 4s. net; abroad, 4s. 4d.

Although tables, curves, &c., of the properties of steam at different temperatures have existed for long, the lack of

## ELECTRICAL PHOTOMETRY AND ILLUMINATION.

By PROF. HERMANN BOHLE, M.I.E.E.,

Professor of Electrotechnics, S. A. College, Cape Town.

CONTENTS.—Photometric Units and Standards.—Radiation and its Effects.—Photometric Apparatus.—Light Flux and Distribution.—Testing of Electric Lamps.—The Design of Shades and Reflectors.—Illuminating Engineering.—INDEX.

In Large 8vo. Handsome Cloth. Fully Illustrated. 21s. net

## TRANSFORMERS.

By HERMANN BOHLE, M.I.E.E.,

Professor of Electrotechnics, S. A. College, Cape Town,

And PROF. DAVID ROBERTSON, B.Sc., A.I.E.E., OF BRISTOL.

CONTENTS.—General Principles.—Magnetising and No-Load Currents.—Losses in Transformers.—Iron Losses.—Copper Losses.—Temperature Rise.—Magnetic Leakage.—Leakage Inductance.—Vector Diagrams for Transformers.—Systematic Testing of Transformers.—Insulating Materials.—Examples of Construction.—Design of Transformers.—Applications of Transformers.—Regulating and Phase-Changing Transformers.—INDEX.

"This very complete treatise . . . a model of what technical publications should be."—*Nature*.

In Medium 8vo. Pp. i-xx + 313. With 366 Figures and 23 Tables. 25s. net.

## ELECTRIC CRANE CONSTRUCTION.

By CLAUDE W. HILL, A.M.Inst.C.E., M.I.E.E., &c.

CONTENTS.—Overhead Cranes.—Locomotive and Portable Jib Cranes.—Derrick Cranes.—Transporters.—Sheer Legs.—Revolving Cantilever Cranes.—Cableways.—Power required for Crane Driving.—Starting Torque and Acceleration.—Design of Crane Structures.—Design of Machinery.—Brakes.—Toothed Gearing.—Hooks, Lifting Magnets, Ropes and Cranes.—Design of Magnets.—Motors, Controllers and Collectors.—Crane Installations.—INDEX.

"The whole work is straightforward, and may be recommended as being written from a thoroughly engineering point of view."—*Electrical Engineering*.

LONDON: CHARLES GRIFFIN & CO. LTD., EXETER ST., STRAND

complete knowledge of the subject resulted in certain errors and inconsistencies in the older tables. The researches of Prof. H. L. Callendar in this country and Prof. Mollier on the Continent have now linked up theory and experimental results by extending both, and it has now been possible to construct tables of an accuracy heretofore unattainable. The authors' tables are formed on the work of Callendar, and practically agree with the information worked out on the same basis in graphic form by Mollier. Their importance is best expressed by quoting the words of Sir J. Alfred Ewing's introduction:—"It is to be hoped that with the additional assistance these tables supply, English engineers and students will realise that the new method of calculation should be adopted, and the tables and formulæ of the old text-books be abandoned as obsolete." The tables are given in Fahrenheit units as a concession to the old school of English engineers, as well as in the centigrade units that are now so fast taking their place. A brief explanation precedes the tables themselves, and Mollier's chart translated into Fahrenheit units is also included.

**A Handbook of Wireless Telegraphy.** By J. Erskine-Murray. 442 pp. 8½ in. by 5½ in. 195 figures. (London: Crosby Lockwood & Son.) Fourth edition. 10s. 6d. net; abroad, 11s. 4d.

The fact that this is the fourth edition of this work to be reviewed in our columns since 1907 is sufficient evidence that Mr. Erskine-Murray's book is appreciated by the class of reader to whom it is addressed. Since the last edition (see *ELECTRICAL ENGINEERING*, Vol. VII., page 427, July 27th, 1911) there has been considerable general revision, and a new chapter on the telegraphic efficiency of a wireless system has been added. Further additions discuss the theory of abnormal ranges as deduced from actual observations, and new sections deal with the latest developments of the Poulsen, Goldschmidt, and Telefunken systems. Another interesting addition is an appendix containing the specification of the proposed imperial Marconi stations, which have been the subject of so much discussion. The book contains a vast amount of interesting reading of a nature very stimulative of thought, and its merit lies perhaps more in this direction than as a handbook of design for the wireless telegraph engineer.

**Essentials of Electricity—Direct Currents.** By W. H. Timbie. 271 pp. 7 in. by 4½ in.; 224 figures. (London: Chapman and Hall, Ltd.) 5s. 6d. net; abroad, 5s. 9d.

The price of this volume is high for its size, but the quality of the contents is high also. The book is intended to be, and is, suitable for short trade courses for students who wish for advancement. The author has the gift of being able to impart electrical knowledge in a most efficient manner. Well-chosen analogies are often resorted to. The chapter on dynamo troubles is good. Diagrams and simple explanations of a multitude of the commoner applications of electricity to the welfare of mankind are given. Problems are supplied in profusion, but as the book is of American origin, the monetary unit is the dollar, while the B & S wire gauge is of course adopted. The unit wire taken is the mil-foot.

#### THE STANDARD WORK ON THE SUBJECT

## The Law relating to Electric Lighting, Traction and Power

BY

His Honour the late Judge J. SHIRESS WILL, K.C.

**Fourth Edition, 1912**

Price 27/6; for Cash, post free, 22/7.

"To the station engineer, the expert witness, the Bill promoter, and the parliamentary agent, we confidently recommend Mr. Will's work as a sound, a comprehensive, and an up-to-date guide."—*Electrical Times*.

**BUTTERWORTH & CO.**  
BELL YARD, TEMPLE BAR, LONDON

**A First Book of Electricity and Magnetism.** By W. P. Maycock. 351 pp. 7 in. by 5 in.; 162 figures. (London: Whittaker and Co.) 4th edition. 2s. 6d. net; by post 2s. 10d.

It is now twenty-one years since the first edition of this very elementary text-book was published. During this time four editions have appeared, so that it may be said to have enjoyed considerable popularity. It contains some good matter, the style is easy, and it has been brought fairly up-to-date, but the reasoning in places appears a little loose and it is spoiled by a large number of blocks, apparently from manufacturers' catalogues. Very few calculations are made or given, but there is a long and rather useless list of questions and experiments.

**The Baudôt Printing Telegraph System.** By H. W. Pendry. 147 pp. 7½ in. by 5 in.; 72 figures. (London: Whittaker and Co.) 2s. 6d. net; by post, 2s. 9d.

A comprehensive description of the features of the Baudôt system of machine telegraphy and an excellent account of the construction of the apparatus is contained in this small volume. After a very brief introduction, the author starts on a description of the Baudôt apparatus and by page 15 has got to the quadruple distributor. At page 70 a chapter on the electrical connections starts. This method of division of the subject is quite satisfactory for those conversant with the actual machine. The text is very clear, but the average student who wishes to add particulars of the Baudôt system to his general knowledge will find the matter a little difficult to grasp. That the author was writing for those who have to do with the apparatus is shown by the valuable chapter on adjustments and faults, which terminates the book.

**Die Funkentelegraphie.** By H. Thurn. 128 pp. 7½ in. by 5 in. 58 figures. Leipzig: B. G. Teubner.) M. 1.25; by post, 2s.

This little volume is one of a series of books in German on scientific subjects of a semi-popular nature, and deals with wireless telegraphy and its modern developments in a practical and readable manner, with a considerable degree of detail. As might be expected, the Telefunken system is the example selected for treatment at length, and an interesting illustrated description of the actual apparatus used is given. A short chapter is devoted to wireless telephony, and further sections of the book deal with the field wireless communication is likely to occupy in commercial applications by sea, land, and air. The regulations, both national (German) and international, governing its use are set forth, including the results of the recent conference in London. Statistics of stations in different countries are also given.

**La Télégraphie et la Téléphonie Simultanées et la Téléphonie Multiple.** By K. Berger. Translated into French by P. le Normand. 134 pp. 10 in. by 6½ in. 111 figures. (Paris: Librairie Gauthier-Villars.) 4s. 6d. net; by post, 4s. 9d.

In the first part of this book, which is a French translation of a work by an official of the German telegraph service, the various methods of simultaneous telephony and telegraphy are discussed from both theoretical and practical points of view, including both telephoning over existing telegraph lines and telegraphing over double-wire telephone circuits. The second part of the book is devoted to multiple telephony, including the arrangement of superposed and "phantom" circuits, which are treated in equally thorough manner. The difference between Continental and English and American practice in these respects will interest telegraph engineers in this country.

**Elementary Manual on Applied Mechanics.** By A. Jamieson. 452 pp. 7½ in. by 5 in. About 230 figures. (London: Charles Griffin & Co., Ltd.) 10th edition. 3s. 6d.; abroad, 4s.

Additions and revisions, involving in all an increase of 26 pages, have been made in the tenth edition of this deservedly popular text-book by the late Professor Jamieson. The list of symbols and abbreviations used are given at the beginning of the book, so that one has no difficulty in following the text, which is well illustrated with a number of diagrams, sectional drawings and photographs, the constituent parts of which are conveniently indexed. The elementary principles of practically every type of machine and mechanism are dealt with, as well as hydraulics, the properties of materials, &c. A large number of questions taken from the Ordinary Grade Papers in Mechanical Engineering, set by the City and Guilds of London Institute, and from the examinations conducted by other examining bodies, are included. In many cases the answers are also given.

**The Universal Electrical Directory (G. A. Berly's), 1913.** 1556 pp. 9½ in. by 6½ in. (London: H. Alabaster, Gatehouse & Co.) 21s.; British and Colonial Sections only, 12s.

The 1913 edition of the "Red Book" has been as carefully revised as previous issues. The contents are again divided into four sections, viz., British, Colonial and General, Continental, and U.S.A., and some 35,000 entries are made. In addition to the usual directory entries, however, there are lists of electricity undertakings in the United Kingdom, the British Colonies, and some other countries, whilst a valuable addition to the British Section is a list of trade names, followed by the maker's or agent's name and address.

**Spon's Architects' and Builders' Pocket Price Book and Diary, 1913.** Edited by C. Young and S. M. Brooks. 308 pp. 6½ in. by 3½ in. (London: E. & F. N. Spon, Ltd.) 2s. 6d. net; by post 2s. 8d.

In view of the continually shifting, and, in these days, unfortunately rising prices of all kinds of raw material, and cost of production generally, the keeping of a work of this kind up to date is a difficult task, but the problem has been bravely faced, and in this issue the whole of the prices have been revised to accord with present values. Substantial additions have also been made, including a new section on charges and fees payable. The memoranda section is now issued as a separate volume, entitled, "Spon's Practical Builders' Pocket Book."

**Electric Cranes.**—In response to several inquiries as to the standard book on this subject, we would draw attention to "Electric Crane Construction," by Claude W. Hill, published by Messrs. Charles Griffin & Co., Ltd., and obtainable from the office of ELECTRICAL ENGINEERING, 25s. net; abroad 25s. 10d. It is a very complete handbook on crane design, and most trustworthy. Every description of crane is fully discussed, and

chapters are devoted to power, starting torque, brakes, gearing, hooks, &c., magnet design, motors, controllers, &c., &c. The book is copiously illustrated.

**Finsbury Technical College O.S.A. Magazine.**—The most recent issue of this, now quarterly, publication, contains an abstract of Mr. C. E. Foster's Paper on inexpensive pyrometers, which was read last session before the Sheffield branch of the British Foundrymen's Association, and for which the author was awarded the Wallis-Jones medal. Some notes on the new third year course at Finsbury Technical College are contributed by Mr. J. D. Johns, while the doings of old students, the report of the last annual dinner, and other miscellaneous, but interesting, information, including a portrait of Mr. Foster, completes the issue.

**The National Electric Light Association of America.**—The Proceedings of the 35th Convention of the National Electric Light Association, held at Seattle in June last, fill four good-sized volumes, of which we have been favoured with copies. The first volume, of 458 pages, is devoted to general, executive, public policy, and company "sessions," and a large number of reports, papers, and discussions on very diverse subjects are included. The second volume, of 576 pages, deals with commercial aspects of electricity supply, and the third contains reports of the meetings devoted to power transmission and technical matters generally, and aggregates 688 pages. The last, and smallest, volume contains papers and reports treating of accounting. The utility of the whole series, which touches nearly every branch of electric supply matters in some way or other, is enhanced by the synopses of the papers at the beginning of each volume. A good deal of the matter discussed is of world-wide importance, but naturally there is a large proportion applicable only to American conditions. Much of this, however, is of interest to English engineers as a comparative study, as well as sometimes suggesting methods that might be adopted in modified forms over here.

## Messrs. LONGMANS & CO.'S LIST

**POWER HOUSE DESIGN.** By JOHN F. C. SNELL, M.Inst.C.E., Vice-President of the Institution of Electrical Engineers, &c. With Seventeen Folding Plates and 186 Illustrations. 8vo. 21s. net.

*This book is intended to provide a complete summary of modern practice in the design of power houses for the generation of electricity, and it is divided into sections, dealing respectively with steam, gas, oil, and hydro-electric systems.*

NEW EDITION, 1908. With 389 Illustrations. Crown 8vo. 12s. 6d.

**ELECTRICAL ENGINEERING FOR ELECTRIC LIGHT AND POWER ARTISANS AND STUDENTS** (embracing those branches prescribed in the Syllabus issued by the City and Guilds Technical Institute). By W. SLINGO, Engineer-in-Chief, General Post Office, A. BROOKER, and T. F. WALL, M.Sc.

THIRD EDITION. With 376 Illustrations and Diagrams, 8vo. 10s. 6d. net.

**ELEMENTARY TREATISE ON ELECTRICITY AND MAGNETISM.** By G. CAREY FOSTER, F.R.S., Fellow of and Emeritus Professor of Physics in University College, London; and ALFRED W. PORTER, B.Sc., Fellow of and Assistant-Professor of Physics in University College, London. Founded on Joubert's "Traité Élémentaire d'Électricité."

**PRACTICAL MEASUREMENTS IN RADIO-ACTIVITY.** By W. MAKOWER, M.A., D.Sc., Lecturer and Demonstrator in Physics in the University of Manchester; and H. GEIGER, Ph.D., Lecturer in Physics in the University of Manchester. With 61 Diagrams. Crown 8vo. 5s. net.

"The authors are to be congratulated upon having produced a practical and useful book that will be appreciated by all workers in the intensely interesting field of radio-activity. The illustrations are good, and there is a full index."—*Chemical News*.

**ELECTRICITY AND MAGNETISM.** By S. G. STARLING, B.Sc., A.R.C.Sc., Head of the Physical Department in the West Ham Municipal Technical Institute. With Diagrams. Crown 8vo. 7s. 6d. net.

"Considering its modest proportions and its moderate price, the book must, for its excellence, be afforded a place of honour on the shelf of technical literature."—*The Times*.

**THE PRINCIPLES AND PRACTICE OF ELECTRIC WIRING FOR EVENING STUDENTS.** By ARCHIBALD BURSILL, A.M.I.E.E., Lecturer in Physics and Electrical Engineering, Paddington Technical Institute. With 166 Illustrations. Crown 8vo. 3s. net.

"An excellent example of a modern text-book for technical students, lucid, terse, and well illustrated."—*Ironmonger*.

"This book is thoroughly well done, and should be of great assistance to all practical wiremen and others who have to deal with lighting and power systems."—*Automobile and Carriage Builders' Journal*.

**LONGMANS, GREEN & CO., 39, Paternoster Row, London, E.C.**

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelopes.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1330.

Rotary converters when running with fixed A.C. input voltage are capable of delivering D.C. variable voltage within small range, without special boosting arrangements.

In the case of a six-phase rotary giving a D.C. voltage of 550-600, how can the power factor and exciting current be calculated for the different voltages, the A.C. input voltage being constant?

How much reactance should the transformer, which is supplying current to the slip rings, have? A. D.  
(Replies must be received not later than first post, March 20th.)

### ANSWERS TO No. 1,328.

A 72 b.h.p. motor, 570 r.p.m., is developing this h.p. and transmitting a proportion through 1:6 ratio spur gear, 92 per cent. efficiency; second reduction, worm-gear triple thread, 1:30 ratio, 70 per cent. efficiency; third reduction, 1:6 ratio spur gear, 90 per cent. efficiency. The efficiencies stated are at full load. What are the losses in the gear when motor is developing 10 b.h.p. at same speed?—W. A. C.

The first award (10s.) is made to "Mu" for the following reply:—

It is difficult to obtain reliable figures for the efficiency of gearing, since these can only be determined by measuring the input to, and the output from, the gear, and the "input-output" method of determining efficiency is notoriously unreliable. It may be taken, however, that the loss in any set of reduction gear consists of two components, one (the fixed loss) which is constant for a given speed, and one (the load loss) which is directly proportional to the power transmitted. This, though not strictly correct, is accurate enough for practical purposes. The proportion of fixed to load losses varies greatly in different gears. In moulded or inaccurately cut gears the fixed loss is high, and the total loss varies comparatively little with varying loads. In the present case, assuming accurately cut gearing designed for a normal load of 72 h.p. on the driving motor, it will probably be somewhere near the truth to take the fixed losses as one-third of the full load losses in the spur gear, and one-sixth in the worm gear. Working on this assumption, the loss in the first spur gear at full load is 5.7 h.p., of which 1.9 is fixed, and 3.8 load loss. The loss at 10 h.p. will therefore be  $1.9 + \frac{10}{72} \times 3.8 = 2.43$  h.p., and the input to the worm gear 7.57 h.p.

The loss in the worm gear at full load = 19.8 h.p. = 3.3 h.p. fixed, and 16.5 h.p. load loss. The loss at 7.57 h.p. =  $3.3 + \frac{7.57}{66.3} \times 16.5 = 5.19$  h.p., leaving 2.38 h.p. input to the second spur gear. The loss in this at full load = 1.55 h.p. fixed and 3.1 h.p. load loss, and the loss at 2.38 h.p. =  $1.55 + \frac{2.38}{46.5} \times 3.1 = 1.71$  h.p. Thus the total loss in the gearing at a load of 10 h.p. on the motor = 9.33 h.p. and the output available = 0.67 h.p. It will, of course, be understood that the figures quoted above, while probably fairly near the truth, may, on the other hand, be quite misleading, since it is impossible to determine the proportion of fixed to load losses from the particulars given in the question.

I would suggest to "W.A.C." that he should, if possible, take a reading of the input to the motor, in volts and amps., when driving the gearing light, the normal load being entirely disconnected. The makers of the motor should be able to tell him fairly accurately the efficiency, and hence the output of the motor at this input, and no great error will be introduced by assuming that  $L = a + bP$ , where  $L$  = losses in gearing and  $P$  = output of motor.

From the light-running reading and the known efficiencies at 72 h.p. the constants  $a$  and  $b$  can be readily determined, and substituting  $P = 10$  will give the losses in the gearing at 10 h.p. on the motor. It is, of course, quite possible that the power required to drive the gearing light will exceed 10 h.p.

The second award (5s.) is made to W. H. who writes as follows:—

Taking the first spur gear having a 6/1 reduction and a full load efficiency of 92 per cent., the input is 72 h.p. and the output is 66.2 h.p.; therefore, the output of the worm gear is 46.8 h.p. and the output of the second spur gear is 41.6 h.p. The above figures are based on the assumption that the full load of each gear is its actual load when the motor is giving an output of 72 B.H.P. Incidentally, it may be as well to mention that 70 per cent. efficiency for a worm gear is absurdly low, and a figure of 88 per cent. is much nearer the actual efficiency of such a gear. In support of this statement is the fact that at full load the loss in the gear amounts to 19.8 h.p., and as this is converted into heat it will be seen that an excessive temperature is almost certain to result if the gear is of normal dimensions. However, in the accompanying diagram are shown the efficiency curves of the three gears, and from these are plotted the curves showing horsepower output as ordinates against horse-power input as abscissæ. We have a 10-h.p. input to the first spur gear, giving 6.5-h.p. output, i.e., a loss in the first gear of 3.5 h.p.

EFFICIENCY CURVES FOR GEARING.

This gives an input of 6.5 h.p. to the worm gear and a corresponding output of 1 h.p., i.e., a loss in the worm gear of 5.5 h.p. The input to the second spur gear is, therefore, 1 h.p., and it will be seen that this is not sufficient to turn the gear round at full speed. Working backward on the curves it will be seen that 2 h.p. is required to turn the second spur gear round at full speed without any output being taken from its countershaft. Therefore, the output required from the worm gear is 2 h.p., with a corresponding input of 8.2 h.p., and this latter figure, being the output of the first spur gear, requires an input of 11.7 h.p., i.e., the output of the motor will require to be 11.7 h.p. to turn the complete gear idly. The losses under these conditions will be as follows:—

First spur gear (11.7-8.2) h.p. = 3.5 h.p.

Worm gear (8.2-2) h.p. = 6.2 h.p.

Second spur gear (2-0) h.p. = 2.0 h.p.

## BROWN-BOVERI AUTOMATIC PRESSURE REGULATORS

RAPID AND ACCURATE REGULATION.  
NO SPARKING.  
NO "TOUCHING UP" OF CONTACTS.

CAXTON HOUSE  
LONDON S.W.

### A BENCH GRINDER

THE Wilson-Wolf Engineering Co., Ltd. (Thornton Road, Bradford), have sent us particulars of a new pattern of electric bench grinder which they have just put on the market. The machine has been designed for hard and constant work. The motor is shunt-wound, is rated at 1 h.p.

ECONOMIC BENCH GRINDER.

and runs at a speed of about 1,800 r.p.m. It is fitted with Hoffmann ball bearings, and is quite dust-proof. The motor is mounted on a box base of rigid design, which carries two tool rests. These, besides being adjustable to the wear of the wheels, are capable of a vertical and angular adjustment to accommodate work of varying thicknesses and shapes. A starter, with no-volt release attachment, is fitted within the

box base, and is actuated by the hand-wheel seen in front. The standard equipment supplied with each grinder consists of two 8-in. by 1-in. wheels, of any grade to suit the work. The machine can also be supplied as a special heavy-duty grinder, equipped with one 10-in. by 1½-in. wheel.

### NEW INCANDESCENT LAMPS

A NEW lamp, giving a soft, diffused light without glare, and producing a distinctly decorative effect, has been

"GLOBOLITE" LAMPS.

introduced by the Stearn Electric Lamp Co., Ltd. (47 Victoria Street, S.W.), under the name of the "Globolite" Lamp. One form is illustrated here. There is an inner lamp containing the filaments and an outer, slightly obscured, prismatic diffuser, permanently attached to it. They are made with metal filaments in the 28-watt size for 100 to 120 volts, pear-shaped or round, and in the 33-watt size for 200 to 250 volts, as well as for smaller candle powers, with carbon filaments. Other novelties being introduced by the Company are radiator lamps with Edison screw instead of B.C. terminals and 200-250 volt, 25 or 33 watt, "Leuconium" metal filament lamps in tubular form.

### SLOW-BREAK SWITCHES

FOR many purposes a quick-break switch is not necessary, as in equaliser switches and switches for short-circuiting starters on motor generators, switches for cutting out or short-circuiting the series coils of compound-wound machines that are desired to run for the moment as shunt machines. In many such cases quick-break switches are unnecessarily used, because slow-break, the more suitable and cheaper switches, are not available. The General Electric Company, however, by laying in heavy stock, have put themselves in a position to give immediate delivery of their "Witton" slow-break switches which are made in sizes from 100 amperes up to 3,000 amperes and in the single, double and triple-pole patterns. In the design of these switches there are a number of points to which special attention has been paid. Good grinding over the whole area of faces in contact is the first essential, and in "Witton" switches this, coupled with a low-current density at the contacts of 90 amperes per sq. in., is responsible for a very small power loss. In a 1,600-ampere size, for instance, there is only a contact drop of 9 millivolts at the break, and three millivolts at the hinges, a total of 19 watts. In the change-over type, off-stops are provided which prevent the possibility of the switch falling back on the lower contacts should it by any chance work loose.

### A NEW SEMI-INDIRECT FITTING

WE illustrate here a new semi-indirect fitting which has been produced by the British Thomson-Houston Co. (Mazda House, Upper Thames Street). This consists of an inverted "Veluria" reflector suspended by a chain and with a single lamp placed inside so as to be completely hidden. This now well-known form of reflector is particularly suitable for semi-indirect lighting on account of the excellent diffusion obtained.

VELURIA SEMI-INDIRECT FITTING.

## THE THREE-PHASE EXTENSION AT MARYLEBONE

### Mr. Snell's Full Report

IN our issue for January 16th we reported an important decision come to by the St. Marylebone Borough Council to adopt a three-phase 6,600-volt system for all future extensions at the Richmond Street power house of the Council, as the result of a preliminary report by Mr. J. F. C. Snell. The Council then decided to accept the tender of the Maschinenfabrik Oerlikon for two 8,750 k.v.a., 6,600-volt, 50-cycle (two-pole), turbo-alternators running at 3,000 r.p.m. British-made condensers are recommended, one to be worked in conjunction with the canal water and one on the cooling towers. The present equipment of boilers is considered ample for some time to come. The total scheme is estimated to cost £42,000, or only £7 per kw. installed. Mr. Snell's full report, in which he deals with the question of converters, switchgear, &c., came before the Council at their meeting on February 20th, and, after some discussion, Mr. Snell's further recommendations were adopted. He recommends that with regard to converting plant, 1,000-kw. machines should be used and standardised, and that four be installed immediately, namely, one at the generating station, two at Manchester Square sub-station, and one at Rathbone Place sub-station. For the transmission system he recommends three 0.15-sq. in. three-core E.H.T. cables from the generating station to Manchester Square sub-station, and two similar cables from Manchester Square to Rathbone Place sub-station.

Mr. Snell further recommends that the Council should leave the present continuous-current plant unaltered and use it only for peak-load purposes, and as a reserve to the three-phase plant during lighter loads. Although the steam consumptions of the old plant are 35 per cent. above the guaranteed steam consumption of the new plant ordered, yet, having regard to the present high price of copper, the great weight of cables already laid in Marylebone and the present capital commitments of the Council, Mr. Snell has come to the conclusion that an entire change to three-phase generation must be dismissed as impracticable. When the new plant is installed, it is estimated that 80 per cent. of the output can be dealt with by it, under the conditions mentioned above.

With regard to the plant, apart from the turbo-alternators, for which tenders have already been accepted, the following recommendations are made by Mr. Snell: switchgear, Messrs. Ferranti, £2,384. Mr. Snell originally recommended Reyrolle switchgear as being preferable on engineering and other grounds, but in view of the alternative prices since obtained being considerably lower, he, in a later report, withdrew this recommendation on financial grounds; condenser motors and control switchgear, Maschinenfabrik Oerlikon, £1,709; four 1,000-kw. converters, British Westinghouse Company, £8,908; condensers, pumps, &c., Worthington Pump Company, £8,964. The estimated cost of cables is put at £10,600.

At the Council meeting the recommendations were referred back, and a protest was entered against Swiss plant being ordered. Eventually the recommendations of Mr. Snell as embodied in the Committee's Report were carried.

## CATALOGUES, PAMPHLETS, &c., RECEIVED

**STEAM TURBINES.**—A handsome pamphlet from Richardsons, Westgarth & Co., Ltd. (Hartlepool), describes the combined impulse and reaction which they build of the same pattern as the Brown-Boveri-Parsons machines built on the Continent. We understand that they have supplied, and have in hand, a large number of turbines of this type in various sizes. The advantages of combining initial impulse stages with reaction leading for the final expansion are fully explained, and important details of construction, special governing arrangements, &c., are pointed out by the aid of drawings. A large number of photographs are also reproduced of actual installations, ranging up to machines of 28,000 h.p. Curves of steam consumptions are given, and a final section deals with back-pressure and by-pass turbines.

**MEASURING INSTRUMENTS.**—A new list from the Electrical Company, Ltd. (122-124 Charing Cross Road), which forms one of the 30 sections which will make up their complete bound catalogue, is devoted to moving iron, moving coil, and dynamic ammeters and voltmeters, portable instruments,

electrostatic voltmeters, insulation testing sets, and other instruments and accessories.

**CABLES AND WIRES.**—A mailing card calls attention to the cables, flexible cords, &c., supplied by the Metallic Seamless Tube Co., Ltd. (Corporation Street, Birmingham).

**GAS BURNERS AND BLOWPIPES.**—A list of "Bornkessel" burners, of a variety of forms useful to the incandescent lamp-making and other industries, is to hand from the sole agents for these articles, C. Melin & Co. (7 India Street, Crutched Friars, E.C.).

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**SPECIALITIES.**—A folder from Magic Appliances, Ltd. ("H. & O." Dept. 6, Farrington Avenue, E.C.), draws attention to the Hotwynd Blower for hair drying, bed warming, drying photographic plates, &c. The rating is 60 watts. Another apparatus, known as the Oscillus Vibrator for the treatment of various skin affections, is also described.

**INCANDESCENT LAMPS.**—An effective chart in the form either of a blotter or a postcard, has been prepared by the British Thomson-Houston Co., Ltd. (Mazda House, Upper Thames Street, E.C.), showing by representations of lamps of comparative size the various steps in which the cost of lighting by incandescent lamps has gone down from the old carbon lamps of 1885, which (at 1s. per unit), gave 200 candle-hours for 1s., to the modern Mazda lamp, which (at 4d. per unit), gives 2,400 candle-hours for 1s.

**Institution of Electrical Engineers.**—The following is the result of the ballot for new members, and transfers from one class to another, at the meeting on Thursday. *Members:* L. E. Caine, F. G. Clark, H. A. Cox, W. Cross, E. P. Grove, Prof. D. C. Jackson, C. G. Stjernberg. *Associate Members:* A. M. Anderson, A. L. Ballard, L. W. Ballard, F. O. Barralet, J. H. Baxter, T. C. Booth, F. H. Brandreth, W. E. Brandreth, W. J. Branson, R. A. Brown, R. H. Bryans, A. Burnet, J. H. Cardew, H. V. Cornish, J. R. Elliott, W. P. Elliott, H. D. Evans, W. B. Good, T. I. Gordon, J. D. Hathaway, E. Hedley, H. H. Holmes, L. A. Hoyle, W. C. Knight, R. W. Law, W. A. MacKenzie, J. Y. MacKersie, G. A. Madden, D. Martin, P. M. Martin, J. R. Matthews, R. C. Milliken, A. N. Moor, G. Murray, G. Nicolson, A. Regnaud, J. L. Smith, H. A. Stanton, F. V. Stephen, W. Tancred, J. W. Turner. *Associates:* R. L. McCulloch, J. F. Newall. *Graduates:* C. W. Braithwaite, E. C. Channell, E. P. Collett, R. S. Davis, F. S. Dinenage, T. Drummond, T. W. Elsdon, J. W. Leach, T. H. McNaught, O. Melville, R. J. Mitchell, T. F. Stent. *Students:* E. C. Albrecht, S. Baker, B. C. Bayley, C. R. Bicknell, N. B. Bunt, R. L. Castle, A. S. Carr, J. C. Clarke, L. F. Clement, W. T. Crichton, W. G. Cross, T. C. de Moura, A. V. dos Santos, H. Gregson, J. O. Griffiths, B. E. Mittell, B. S. Orme, N. Pemberton, J. H. Salisbury, A. Schamasch, M. Smith, G. O. Tipping. *CANDIDATES TRANSFERRED—Associate Member to Member:* E. Calvert, A. S. Campbell, C. Carew-Gibson, J. H. Carrick, W. L. Carter, A. G. Cooper, H. G. Cotsworth, J. H. Edwards, H. S. Ellis, T. F. Forster, J. Gray, F. S. Grogan, E. P. Gunter, R. J. Kaula, W. F. Long, J. H. Mackail, R. S. McLeod, R. B. Mitchell, F. W. Parkinson, E. Ridley, F. H. Whysall, C. B. Wigg, J. H. Wild, J. H. Williams. *Associate to Associate Member:* A. T. Bartlett, E. A. Reynolds. *Associate to Associate Member:* P. C. Austwick, A. B. Blakey, H. E. Britton, J. C. Johnston, W. Mead, T. Pearson, H. W. Stovold. *Student to Associate Member:* E. V. Buchanan, T. C. Christianson, H. Clark, E. A. Corbin, J. G. Craven, F. Murphy, R. J. O'Brien-Owen, A. C. Towers, E. A. Watson. *Student to Graduate:* G. J. Baldock, J. W. Beck, H. Butler, A. G. Cross, J. K. Hwoo, E. A. Richards, A. Smellie.

**The Batti-Wallahs.**—This Society held its annual general meeting at the Golden Cross Hotel on March 3rd. The president, Mr. F. J. Collis, was in the chair, and his place was afterwards taken by Mr. J. Snow Huddleston, who was unanimously elected president for the ensuing year. Mr. Pooley, the secretary, reported that the finances of the Society were in a healthy condition, and that the progress made during the past year was remarkably good. Four smoking concerts, a dinner, seven informal meetings, a down-river trip, an up-river trip, and a barge trip were held during the year. The vice-presidents are Messrs. J. F. Avila, Hady T. Harrison, W. A. Jones, and C. Newton Russell, and the committee Messrs. Campbell, Carter, Gardner, Greenly, Smith, and Warriolow. Messrs. Collis, Pooley, and Robinson were thanked for their untiring efforts.

**The Electrical Trades Benevolent Institution.**—The annual general meeting of this institution will be held on March 31st, at the Institution of Electrical Engineers, at 2.30 p.m., with Mr. E. Garcke in the chair. The meeting will be composed only of "members" of the institution.

# "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

## Specifications Published March 6, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

3,105/12. **Train or Car Lighting.** H. F. FOSTER and A. W. S. POCKLINGTON. The variable-speed dynamo to be used in conjunction with accumulators is provided with an automatic cut-in and cut-out switch, actuated by the magnetism of the field, and consisting of a pivotted armature placed behind one of the main poles. The external circuit is closed when the field of the machine rises to a sufficient value, and is opened when a reverse current from the battery passes through a coil carried on the movable armature. The switch is purposely placed in a position where the field is low in order to avoid disturbance by residual magnetism. Two figures.

3,123/12. **Automatic Electric Railway.** J. J. DESCHAMPS. In this system of automatically controlled driverless trains, head-on collisions are prevented by controlling the current in each of the sections into which the track is divided by switches electro-magnetically actuated by the current in the next section ahead, and therefore taking up different positions according to whether a car is on the next section or not, and thereby determining whether the car on the rear section is supplied with current or not. Two figures.

3,325/12. **Heating Resistances.** G. COOPER (British Prometheus Co.). This specification covers a method of coating metal resistance elements with a layer of a precious metal to protect them from the action of the atmosphere at high temperatures. The resistance body is passed through a coating solution and between painting rolls, then through levelling rolls into a drop chamber, and through a drying chamber. Two figures.

3,555/12. **High-frequency Generator.** R. HEYLAND. In this generator the frequency is not determined by the speed and number of poles, but by oscillations of the magnetic field secured by the reaction of a short-circuited polyphase winding unconnected to any source of supply, but having its phases connected in parallel so that oscillations of low frequency are damped out by equalising currents, and only a particular higher harmonic determined by the difference in phase of the separate coils is developed. The oscillations may be strengthened by suitably-tuned inductances and condensers. One figure.

3,590/12 and 30,024/12. **Switches.** H. C. SHELDON (*Sächsische Gruppenwechselshaft*). Systems of obtaining various combinations of control of groups of lamps by two similar switches each containing circuit-closers upon a movable portion insulated from each other, but able to be connected to an outside circuit, and two or four fixed contacts. With only one design of switch, a large number of different schemes of variable connections may be arranged. Nineteen figures.

6,052/12. **Conduit Fittings.** L. G. BYNG and T. TAYLOR (General Electric Co.). This specification covers a method of retaining the clamping screws in one-half of a conduit fitting, of the type that grips the conduit tube by screwing the halves together so that they cannot be lost. The upper part of each screw is formed without a thread, but the hole in the upper half of the fitting is threaded. Thus when the screw has been put in beyond its thread, it cannot fall out, although it is free to rotate as required to draw up the other half of the fitting. In an alternative arrangement the hole in the upper part of the fitting is made to clear the thread for insertion of the screw, and later partly closed by special tools. Four figures.

9,210/12. **Variable-speed A.C. Motors.** BRITISH THOMSON-HOUSTON Co. (*G.E.C., U.S.A.*). Two brushes are provided per pole, and the speed is controlled by varying the distance between them. The arrangement is applicable to forms of repulsion as well as of conduction motor. Two figures.

## Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

**Arc Lamps:** B.T.-H. (*G.E.C., U.S.A.*) [Electrodes] 11,792/12; SIRON [For cinematographs and other projections] 26,886/12.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** KEMMERICH [Speed regulation of electrical ring-spinning machines] 4,140/12 and 4,590/12; B.T.-H. and WEDMORE [Protective gear] 10,545/12; SIEMENS BROS. & Co. (*Siemens & Halske*) [Controlling circuits in regular sequence] 20,914/12; BERGMANN [Protective gear] 21,831/12.

**Dynamos and Motors:** B.T.-H. (*Noeggerath*) [Homopolars] 4,187/12; MORGAN CRUCIBLE Co. and GRANT [Brush holders] 4,592/12.

**Heating and Cooking:** PERRY [Cooking] 4,090/12; J. SLATER & Co. and ALLENSBY [Radiator] 6,864/12.

**Ignition:** BRENOT, 10,130/12.

**Switchgear, Fuses, and Fittings:** BEUTTELL [Mounting of and reflectors for incandescent lamps] 1,186/12; WORSNOP [Miners' safety lamps] 4,933/12; REGNART [Holders for candle lamps] 5,560/12; KOVACS [Fuse] 19,218/12; VANDERVELL and MIDGLEY [Switchboards] 27,501/12.

**Telephony and Telegraphy:** BROWN [Telegraphy] 6,275/12; JOHNSON [Telephone exchanges] 8,997/12; SCHIESSLER [Telephone receivers] 27,969/12.

**Traction:** J. STONE & Co. and DARKER [Lighting, heating, and ventilating railway carriages] 4,073/12; MUNRO and R.E.T. CONSTE. Co. [Trolley-pole sockets] 4,264/12; WRIGHTMAN [Locomotive signal] 6,555/12.

**Miscellaneous:** KORYTOWSKI [Electrically-operated doors] 3,736/12; BLOXAM (*Ericsson, Russia*) [Remote indication of movements] 3,742/12; GEB. SIEMENS [Copper coating carbon] 3,917/12; MOLONEY [Fire alarm] 4,777/12; RICHARDS [Clutches] 7,928/12; WOLLISCROFT and H. T. BOOTROYD's [Slow motion gears for starting elec. motors] 10,366/12; MONTGOMERY [Magnetic water-level indicator for steam boilers] 16,483/12; WEINBERG, SCHRIMMER, and BUETZER [Umbrella shock protector] 21,162/12; FRIEDRICH DIEZ [Battery electrodes] 21,739/12; GAMPER [Packing magnetic material] 28,233/12; WEHRLIN [Preventing generation of chlorine by penetration of sea-water into elec.-driven vessels] 28,518/12, [Protecting accumulators from flooding by sea-water] 28,519/12.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Dynamos, Motors, and Transformers:** HILDEBRAND [D.C.-A.C. transformation] 17,346/12.

**Electrochemistry:** ELEKTROZITÄTS WERK LONZA [Recovering alkali metals from fused halogen compounds] 3,575/13.

**Incandescent Lamps:** WESTINGHOUSE METALLFADEN GLÜH-LAMPENFABRIK [Tungsten filaments, &c.] 3,162/13.

**Switchgear, &c.:** GABREAU ET DELAUX [Regulators] 21,813/13.

**Telephony and Telegraphy:** SIGNAL GES. [Wireless] 3,246/13; SIEMENS & HALSKE [Automatic and semi-automatic exchanges] 3,344/13 and 3,431/13, [Telegraph system unaffected by near H.P. lines] 3,432/13.

**Miscellaneous:** PUCEL [Alarm] 3,335/12; STEYNIS [Production of ozone] 3,769/12.

The following Amended Specifications may now be obtained.

**Incandescent Lamps:** B.T.-H. (*G.E.C., U.S.A.*) [Metallic tungsten] 21,513/06 (*ELECTRICAL ENGINEERING*, Feb. 27th, p. 122).

**Telegraphy:** S. G. BROWN [Relays] 20,451/11.

## Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

5,657 of March 15th, 1899. **Wireless Telegraphy.** G. MARCONI and WIRELESS TELEGRAPH & SIGNAL Co. This relates to the construction of and connections for transmitting keys provided with back contacts arranged to cut out the receiving apparatus when sending, and the transmitting apparatus when receiving, without other switches.

5,932 of March 18th, 1899. **Submarine Telegraphy.** A. POLLAK, J. VIRAG, J. EGER and F. SIBERSTEIN. A system of rapid signalling through cables with a receiving instrument constructed on the lines of a telephone receiver, carrying a mirror on the diaphragm which deflects a beam of light.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** CROMPTON & Co. and J. R. MACINTOSH [Automatic reversible battery booster system] 25,522/02.

**Dynamos, Motors and Transformers:** B.T.-H. (*G.E.C., U.S.A.*) [Self-exciting alternators] 24,874/04; E. ARNOLD [Single-phase commutator motors] 23,661/05; M. WALKER [Commutation system] 25,624/07.

**Instruments:** E. J. MURPHY and KELVIN & WHITE [Improvements in electrostatic voltmeters] 26,131/06.

**Switchgear, Fuses and Fittings:** W. H. SCOTT [Switches with laminated contacts] 23,751/05; W. HOWLIN [Clock switches] 23,826/05; E. & O.A. Co. [Tubular fuses] 25,478/07; R. F. VENNEN and R. C. GRIESBACH [Time switches] 24,716/07.

**Traction:** H. LEITNER and R. N. LUCAS [Train lighting] 25,216/02; E. TYER and J. H. HAMILTON [Railway signalling] 25,263/03.

**Miscellaneous:** J. JORDAN [Air brakes for electrical winding engines] 23,729/01; W. REUTER [Lifting magnets combined with grabs, &c.] 24,914/02; A. P. and C. H. WARNER [Eddy current tachometers] 25,026/03; G. C. MAAS [Time alarm signals] 26,524/06.

# ADAMS IGRANIC

ELECTRIC MOTOR CONTROL GEAR FOR STEEL MILLS.

AND  
LONDON

## ELECTRIC TRACTION NOTES

Serious corrosion of the running rails and the overhead steel construction in the Simplon tunnel having been observed, experiments were made to determine whether there was any electrolytic action from the low frequency alternating current (16 cycles). The chief engineer of the Swiss State Railways, Herr Dänzer-Ischer, in his report, published in the *Schweizerische Bauzeitung*, states that the corrosion has been proved to be due to the chemical action of the water in the tunnel, and not in the slightest degree to electrolytic action. Incidentally, however, the experiments showed that over 60 per cent. of the traction current was returning by the earth as the bonding of the rails was not sufficiently good. This is being remedied, and to prevent further corrosion the rails and other steelwork are being protected from the dripping water.

The Swiss papers state that as soon as the Lötschberg line is open to traffic, which should be during the coming summer, the conversion to electric traction of the Scherzigen-Spiez section will be taken in hand, and eventually the line from Spiez on to Berne. The adoption of electric traction on the Spiez-Zweisimmen narrow-gauge line is also under consideration. This connects up with the Montreux-Oberland-Bernois electric line, and together they will form an electric line about sixty miles in length, connecting the lakes of Thun and Geneva. Another projected scheme in Switzerland is the construction of an electric line from Sierre to Goppenstein, which will shorten the route to Berne.

In a long article in *Elektrische Kraftbetriebe u. Bahnen* (Feb. 14th.), Herr G. Brecht, an engineering official of the Prussian State Railways, discusses the decision of the Victorian Government to adopt high-tension direct-current traction for the Melbourne system. He agrees that, in the case of the suburban system of Melbourne, the direct-current is the correct and most economical proposition, but complains of the comparison with the single-phase system in respect of the low trolley pressure (11,000 volts as compared with the German standard of 15,000 volts), the high frequency (25 cycles as compared with the German standard of 16½), and the adoption of four-motor coaches instead of one or two large motors in a locomotive. In particular, however, he rejects as wholly incorrect the ratio of approximately two to one in the first cost and maintenance of equipments (founded, it is stated, upon actual quotations and guarantees), but offers no figures to substantiate his argument. In respect of the comparison of the two systems for the long-distance lines, he considers that the direct-current, and not the single-phase overhead, equipment would have the larger maintenance figure, and that this and the high figure again taken for locomotive maintenance invalidate the comparison which, he considers, should show largely to the advantage of the single-phase system for these longer lines.

The trolley omnibus routes at Stockport, which have been equipped on the Bremen system, patents for which in this country are held by the Brush Electrical Engineering Co., were finally inspected by the Board of Trade officers last week.

### EVERY INSTALLATION ENGINEER

Should join his Trade Protection Organisation,

THE

**ELECTRICAL CONTRACTORS' ASSOCIATION**

(Incorporated).

Inquiries cordially invited by the Secretary,

L. G. TATE,

20, Bucklersbury, LONDON, E.C.

The Manchester Corporation Tramways Committee decided on Tuesday that the Committee's contribution in relief of the rates for the year ending the 31st inst. should be £100,000, which is the highest sum ever paid by any tramway undertaking in the United Kingdom in one year toward the relief of the rates. Last year £85,000 was contributed, and in ten years the total amount paid by this Committee reaches £700,000.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

On 6th March last the cable between Odessa and Constantinople was working normally, and on the following day the routes via Fao and El Arich were repaired but encumbered.—On the 8th March the Lemnos-Salonika cable was restored and traffic for the latter place could be again accepted "via Eastern."—The Ottoman Government announced on the 10th inst. that private correspondence between Turkey and offices opened by the coalition Governments in European Turkey—other than diplomatic messages—are stopped, and the office of origin will not be notified.—On the 10th inst., also, traffic via Fao and El Arich was passing normally.

## LOCAL NOTES

**Accrington: Gas Engine Plant.**—The Engineer has presented a report with regard to the gas engine plant. A three months' trial on one set started on February 4th and no stoppage has occurred since. The gas-making plant was started on a three months' trial on March 1st.

**Barking: Electricity Undertaking.**—The position of the electricity undertaking and the possibility of a supply in bulk being taken from neighbouring authorities, has been under general discussion recently, but the Electricity and Tramways Committee now report that so far as the possible transfer of the undertaking is concerned, no further steps should be taken. For the present, the question of a supply in bulk from West Ham is to remain in abeyance, but negotiations with East Ham for a bulk supply are to be continued.

**Belfast: Electricity Profits.**—The sum of £5,000 is to be transferred from electricity profits to relief of rates.

**Bognor: Electricity Supply.**—The Bognor Gas Co. have lost no time in putting into operation their electric lighting powers, and under the direction of Mr. A. H. Dykes, their consulting engineer, it is hoped that a supply will be available in July of this year.

**Cheltenham: Street Lighting.**—A scheme for substituting thirty-four electric lamps for thirty-three gas lamps has been approved.

**Darlington: Slot Meters.**—It has been decided to fit "penny-in-the-slot" meters, as a demand is springing up for these in a certain class of house. The charge will be calculated on the basis of 4½d. per unit, which will include the supply of metal filament lamps.

**Dorsetshire: Electricity Supply.**—It is anticipated that the County of Dorset Electric Supply Co. will have their electricity works in Swanage, Dorchester, and Blandford in operation this spring.

**Felixstowe: Proposed Purchase of Electricity Undertaking.**—The proposal to purchase the undertaking of the Suffolk Electricity Co., which is leased by the Council, has been referred to a Special Committee of Inquiry. At present the Council are responsible for the finance for the Works, but it is stated that under the proposed scheme it would be relieved of this responsibility.

**Hull: Electricity v. Gas.**—A proposal to light the new Saner Street schools by gas was discussed at the last meeting

## PHENIX ASSURANCE COMPANY, LIMITED.

ESTABLISHED 1782.

Head Offices: 19 & 70, LOMBARD STREET, LONDON, E.C.

TOTAL FUNDS EXCEED  
£15,000,000

CLAIMS PAID EXCEED  
£90,000,000

CHAIRMAN: RT. HON. LORD GEORGE HAMILTON, P.C., G.C.S.I.

Silvertown, London, E.

WHEN CORRESPONDING WITH ADVERTISERS, PLEASE MENTION "ELECTRICAL ENGINEERING."

of the Corporation, and an amendment that electricity be adopted was eventually passed.

**Sidmouth: Arbitration Award.**—Arbitration proceedings took place a short time ago to determine the price which the District Council should pay for the undertaking of the Sidmouth Gas and Electricity Co. As a matter of fact, the electric lighting powers have not yet been put into force. The arbitrator's award has just been issued, and fixes the price at £34,683 for the combined undertaking.

**Stoke-on-Trent: Electricity Works Assessments.**—Strong complaints are being made against the recent assessments of the various electricity works owned by the Council. In one case the assessment has been doubled, and the increases are so large generally, that Alderman Coates, who was at one time Chairman of the Hanley Electricity Committee, is convinced that a mistake has been made. Notice of motion has been given with a view to securing instructions being given to the Town Clerk to appeal.

**Swansea: Electric Lighting Profits.**—Alderman Sinclair, Chairman of the Electric Light Committee, has protested against a proposal to allocate £1,200 from electricity profits to relief of rates. He points out that the reserve fund should be added to until it is one-tenth of the capital expenditure, and it has not yet reached this sum; hence his opposition.

**Truro: Electric Lighting.**—At the Board of Trade offices last week an inquiry was held by Mr. Garnham Roper, Secretary to the Harbour Department, into applications by the Truro Corporation and the Truro Gas Co. for electric lighting provisional orders for that town. Dr. J. W. Purves is advising the Corporation, and he estimated that a plant costing £8,000 would meet the requirements of Truro for a few years. He proposes putting in two 100-h.p. suction gas engines, and two 65-kw. generators, and calculated that at the end of the first year there will be a net profit of £92. He also calculated that there would be 3,500 30-watt lamps in use at the end of the first year, and had worked out his estimates on the basis of each lamp consuming 10 units per annum. The Gas Co. strongly contested these figures, and argued that the estimated consumption per lamp per annum was much too high, four units being nearer the average. The Gas Co. argued, in support of their own Order, that an electrical undertaking in a small town like Truro could not be made to pay unless associated with a gas undertaking, which already had practically all the staff, lands and buildings. The success of the combined electricity and gas undertaking at Ascot was referred to, and Mr. A. E. Brooks, Engineer and Manager of that undertaking, was called in support of the Gas Co.'s case. The estimates of the Gas Co. were that, in spite of having the land and buildings, a capital expenditure of £7,535 will be necessary for the plant, and the figures showed that after a five years' working there would be a profit of £494. At the conclusion of the inquiry, Mr. Garnham Roper asked the Corporation whether, assuming the Board of Trade granted the Council an Order, the insertion of the "Winchester" Clause would be agreed to, and the reply was in the affirmative.

**Walsall: Position of Electricity Undertaking.**—As already noted in these columns, the position of the electricity undertaking is causing grave concern. The accounts now show an adverse balance of £3,853 on the past year's working. Already a recommendation has been made to call in an expert, and, apparently, with the idea of increasing the revenue, it is now proposed that the price of current for lighting purposes be increased from 4d. to 5d. per unit, at the same time abolishing meter rents.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

[Notes of Contracts Open are not repeated under this heading week by week until the last date for receiving tenders, but are only inserted once.]

### Generating Stations, Sub-Stations, Mains, &c.

**Bristol.**—A loan of £25,000 is to be applied for, to cover the estimated requirements of the Electricity Department during the next three years.

**Buxton.**—The Local Government Board have sanctioned loans for electrical extensions.

**Cheltenham.**—Mains extensions at an estimated cost of £338 are contemplated.

**Colchester.**—A loan of £7,660 for electrical extensions has been applied for.

**Darlington.**—A loan of £8,052 for mains and services has been sanctioned.

**Halifax.**—Additional cables are to be laid at an approximate cost of £1,700.

**Hereford.**—A loan of £500 is to be taken up for mains extensions.

**Leeds.**—Two new transformer chambers are to be constructed. Chief Electrical Engineer.

**London: L.C.C.**—Reconstruction and rewinding of seventeen 300-kw. synchronous motor-generators, and three 500-kw. induction motor-generators. Clerk. April 3rd. (See advertisement on another page.)

**Hackney.**—A number of mains extensions are contemplated.

**Manchester.**—The contract for the electric lighting of the Crumpsall Workhouse at a cost of £4,755 has been let to a Salford firm of electrical engineers.

**Newcastle-under-Lyme.**—A new feeder cable is to be laid.

**Peterborough.**—A loan of £7,000 is to be applied for to provide an additional 500-kw. turbo-generator.

**Southampton.**—An important report has been prepared by the Borough Electrical Engineer, in which the installation of additional generating plant is recommended at an estimated cost of £8,200. Mr. Street impresses upon the Committee the necessity for having this plant by next winter.

**Southend-on-Sea.**—A loan of £3,700 for electrical extensions has been inquired into. It is intended to instal a new 500-kw. steam generator.

**Stoke-on-Trent.**—Extensions of mains and also to the switchboard are contemplated at the Hanley Electricity Works at an estimated cost of £4,570.

**Stroud.**—Terms have been arranged between the Council and a company for the erection of an electricity works.

**Walsall.**—A loan of £4,840 is to be applied for to instal additional boilers.

**West Africa.**—The Loanda Municipality require an electric lighting installation. Particulars, 78 Basinghall Street, E.C.

**Wigan.**—A loan of £3,000 for electrical extensions is to be applied for.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Armagh.**—Cinematograph theatre. Architect, T. Houston, Kingscourt, Wellington Place, Belfast.

**Chesterfield.**—Drill hall. Architect, W. H. Wagstaff.

**Croydon.**—126 houses, J. Weller, Dalmaley Road.—Twelve houses, Norbury Court Estate Office.—Twenty-eight houses, Ashburton Avenue, W. Nottle, 250 Albert Road.

**Dukinfield.**—New cinematograph theatre.

**Dundee.**—New hospital in Seafeld Road.

**Hawick.**—New swimming baths.

**Hull.**—Lighting of Saner Street schools.

**London.**—Considerable extensions to Tooting Bec Asylum. Metropolitan Asylums Board.

New hotel, 88 Marylebone Road.

**Nottingham.**—New swimming baths in the Meadows District.

**St. Andrews.**—Cinematograph theatre, North Street.

**Southend-on-Sea.**—Swimming baths. Borough Engineer.

**South Shields.**—Electric lighting of new wing, Nurses' Home at Union. Architect, J. K. Morton, 57 Westgate Road, Newcastle-on-Tyne.

**Swansea.**—Electric lighting of County Police Station. March 20th. Wilts County Surveyor.

### Miscellaneous

**Chichester.**—Twelve months' supply of electric lighting stores for County Asylum. Clerk. March 26th.

**Coventry.**—Two double-deck top-covered and three double-deck non-top-covered cars. General Manager. March 27th.

**Portishead.**—Now that the local electric lighting company has got into working order, the Council have decided to substitute electricity for the existing gas lamps in the streets.

FOR  
**STEAM JOINTS**  
USE

JOHN HUDSON & CO.'S SUCCESSORS, Mansell St., London, E.

**Wallasey.**—General stores for Electricity Department. Borough Electrical Engineer. April 12th. (See advertisement on another page.)

**Windsor.**—The Board of Guardians are considering the question of lighting and power at the Old Windsor Workhouse, and in this connection their attention may be usefully drawn to the experience at Eton, referred to in our "Local Notes" column last week. Local opinion is that it is quite time the antiquated system of lighting and power at the Windsor Workhouse is improved. For several years the Windsor Electric Lighting Co. have offered to go into the matter and to supply current on advantageous terms, but hitherto the proposal has always been out-voted.

## TENDERS RECEIVED AND ACCEPTED

**Birkenhead.**—Messrs. Chamberlain and Hookham have received an order for D.C. meters.

**Bolton.**—Ten tenders have been received for two 4,000-kw. turbo-alternators for the new power station, and that of Messrs. J. Musgrave and Son, Ltd., has been accepted. Five tenders have been received for four water-tube boilers including superheaters and mechanical stokers, and Messrs. Babcock and Wilcox have been given the order. The order for economisers has been given to Messrs. E. Green and Sons. Tenders for switchgear are still under consideration.

**London: Islington.**—The following tenders have been accepted: meters, British Westinghouse Co.; cables, British Insulated and Helsby Cables, Ltd.; lamps, arc-lamp parts, &c., Maxim Lamp Co., Pope's Electric Lamp Co., and General Electric Co., Heap and Johnson; service and network boxes, cable terminals, &c., British Insulated and Helsby Cables, Ltd., Callender's Cable and Construction Co., Lucy and Co., Sykes and Sugden, Dussek Bitumen Co., Indiarubber, Gutta Percha and Telegraph Works Co.

**West Ham.**—Messrs. Chamberlain and Hookham have received an order for A.C. meters of 25-ampere capacity and upwards.

**Manchester.**—The following tenders have been accepted by the Corporation: 300 kw. rotary-converter, General Electric Co.; 500 kw. motor-converter, Bruce Peebles and Co.; auto-transformers, British Electric Transformer Co.; H.T. switchgear and E.H.T. panels, Ferranti, Ltd.

**Nelson.**—The tender of the Tudor Accumulator Co. has been accepted for a traction battery, and that of Messrs. Newton Bros. for a motor-generator and booster.

**South Africa.**—Messrs. Siemens Bros. Dynamo Works have received a contract for the supply of 31,800 "Wotan" lamps for use on the South African railways.

**Staffordshire.**—The Electric Construction have received an order at £335 for electrical plant at the County Mining Institute, Burntwood.

**Worcester.**—A three years' contract for cable has been placed with the British Insulated and Helsby Cables, Ltd., in spite of some opposition at the last Council meeting.

## APPOINTMENTS AND PERSONAL NOTES

Sir Oliver Lodge, F.R.S., has been elected President of the British Association for the meeting at Birmingham this year, in consequence of the death of Sir William White. The Sectional Presidents for the Birmingham meeting have now been appointed, and Mr. J. A. F. Aspinall, General Manager of the Yorkshire and Lancashire Railway Co., is Chairman of the Engineering Section.

Owing to the forthcoming departure of Mr. H. H. Couzens to take up an appointment abroad, applications are invited for the office of Chief Electrical Engineer and Manager to the Hampstead Electricity Department. The salary is £700 a year with a bonus on the profits of the undertaking. A "consumers'" engineer is also required at a salary of £300 a year. (See an advertisement.)

Mr. S. T. Allen, at present Chief Electrical Engineer to the Carlisle Corporation, is recommended for the post of Chief Electrical Engineer at Wolverhampton, at a commencing salary of £600 per annum.

Mr. Charles Mittelhausen, who has recently resigned his

position as Engineer and Manager to the Bexley Council Tramways and Electricity Undertaking, was entertained to dinner, on the 28th February, at Whitehall Court, by the tramways managers of the Greater Metropolitan area.

Mr. F. Clough has been appointed Chief Assistant Electrical Engineer at the new Essex County Asylum, Colchester.

A Chief Electrical Engineer is wanted by the Heywood Corporation at a salary of £200 per annum. Applications to Town Clerk by March 21st.

The Hackney Electricity Committee make the following recommendations: that Mr. T. Dalby be designated Works and Sub-stations Superintendent, at a salary of £200 rising to £300 per annum; that the salary of Mr. E. Mathews, Testing Engineer, be increased from £130 to £140 per annum, and that the salary of Mr. E. Wilkinson, Generating Engineer, be increased from £117 to £127 10s., rising to a maximum of £150 per annum.

Mr. L. E. F. Bellamy has been appointed Borough Electrical and Tramway Engineer at Ilkeston at a salary of £200 rising to £260 per annum.

Mr. W. H. Woods has been appointed Shift Engineer at the Stuart Street generating station, Manchester, at a salary of £175 rising to £190 per annum.

Mr. James Stott, Borough Electrical Engineer and Tramways Manager at Heywood, is resigning on account of ill-health.

Mr. H. Wolfenden has resigned his position as Director and Chairman of the Edison and Swan United Electric Light Co., Ltd. Mr. C. J. Ford succeeds him.

Mr. A. Prentice, of the Central London Railway Power House, has been recommended for the post of Station Superintendent at Walsall, at a salary of £200 per annum, after a trial.

The recommendation to increase the salary of Mr. W. Fennell, Borough Electrical Engineer at Wednesbury, by £25 per annum, has been passed after a good deal of opposition.

## COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**Electrical Distribution of Yorkshire.**—The capital is to be increased by £25,000.

**British Insulated and Helsby Cables.**—The profit for last year amounted to £218,395, in addition to £63,651 brought forward. This represents an addition of £30,136 over the previous twelve months. A final dividend, making 10 per cent. for the year, is recommended, carrying forward £74,231.

**British L. M. Ericsson Manufacturing Co.**—A dividend of 8 per cent. is recommended on the ordinary shares, carrying forward £5,940.

**Metropolitan Electric Supply Co.**—A final dividend, making 4½ per cent. for the year, is recommended for 1912, carrying forward £4,262.

**Vickers.**—It is proposed to increase the ordinary share capital by 740,000 shares. They are to be offered to the existing shareholders at 30s., viz., a premium of 10s.

**Price of Copper.**—Messrs. George Smith and Son, 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £69 to £69 10. (Last week the same.)

**Metal Filament Lamp Patents.**—In the Chancery Division last week, Mr. Justice Sargant had a motion before him in the action of Osram Lamp Works, Ltd., v. Freeman. It appears that the defendant is selling the Gabrielle lamp, and Sir Alfred Cripps, K.C., protested against an interim injunction being granted restraining the sale of these lamps in the country, on the ground that there was a substantial defence to the main action now pending. No motion was made on the order, and the question of costs was reserved.

Mr. Justice Swinfen Eady in the Chancery Division last week granted an injunction against Louis Schloss & Co. restraining them from selling lamps infringing Osram Lamp patents. It was stated that the lamps were purchased from a Belgian company, who in turn had received them from Turin.

On Feb. 21st, in the High Court of Justice, Chancery Division, Mr. Justice Parker granted an interim injunction to the Osram Lamp Works, Ltd., restraining L. Apple, 13 Brewer Street, Regent Street, W. (Brewer Lamps), trading as the West-End Gas Appliances and Ironmongery Stores, his servants, agents, and workmen, from selling lamps infringing Osram Patents Nos. 25,839 of 1904 and 18,622 of 1906. The lamps in question were supplied by Louis Schloss & Co., Rangoon Street, Crutched Friars, E.C.

## SUMMARY

AN "At Home" was given at the Royal Opera House, Covent Garden, last Saturday, to celebrate the twenty-fifth anniversary of the inception of the General Electric Co. (Page 158.)

A FULL description of the system of electrical power supply on the Rand was given in a Paper by Mr. A. E. Hadley at last Thursday's meeting of the Institution of Electrical Engineers. The scheme involves some 176,000 kw., and transmission is carried out at pressures up to 80,000 volts. There is also an extensive scheme of compressed air distribution. (Page 159.)

THE short-circuiting of the temporary connections to a testing meter at the Greenwich power house of the L.C.C. tramways, last week, caused a serious arc

on the switchboard, and the breaking down of two generators. (Page 160.)

A PAPER by Mr. T. P. Wilmshurst, read before the Birmingham Local Section of the Institution of Electrical Engineers, reviewed the present position of electric cooking, and provoked an interesting discussion. (Page 161.)

THERE were useful discussions on Mr. Pearce's and Mr. Ratcliff's street-lighting Paper in Manchester and Birmingham. (Page 162.)

A PROBLEM concerning the accuracy of two phase meters is discussed in our Questions and Answers columns. (Page 163.)

A NEW design of multiblade fan is described on p. 164.

SOME interesting cinematograph films showing various processes in the manufacture of Wotan and Tantalum lamps were exhibited on Monday. (Page 164.)

A FEATURE of the electrical equipment of the East London Railway is the signalling arrangements, there being red and green lamps which light alternately. We also give some general particulars of the scheme.—Petrol-electric motor omnibuses are being tried in Hastings where, it is stated, the Dolter system is to be condemned by the Board of Trade. (Page 165.)

THE National Telephone Co. is appealing against the award for the value of their undertaking.—A scheme for maintaining communication between Aberdeen and Dundee by wireless telegraphy has been put before the Postmaster-General.—We also give figures relating to telephony and telegraphy in Canada. (Page 165.)

APPLICATION for the restoration of a lapsed patent for pull chain lamp-holders has been made by H. Hubbell, of America. A patent for an alternating current column printing telegraph, by W. Higgins, expires during the current week, after a life of 14 years. The specifications published by the Patent Office on Thursday last include two dealing with distribution protective gear, two dealing with heating and cooking, and one by S. G. Brown for a compensating arrangement for use with the patentee's thermo-electric relays. (Page 166.)

THE staff of the Barrow Electricity Department is assisting the Gas Department, owing to a strike.—An electrically-driven breakdown van has been purchased by the Glasgow Electricity Committee.—Increases in the lighting and power tariffs are announced at Lowestoft and Pembroke. (Page 167.)

SWITCHGEAR is required at Shanghai; cable at Blackpool and Stalybridge; an electrically-driven pump at Taunton; electric pumping machinery at Hereford; and sub-station at Holmfirth.—Generating plant is also required in Canada and New Zealand, and electrical stores in Wigan, Bolton and Islington. (Page 167.)

THE Chelsea Electric Supply Co. are installing Diesel-engine plant, and the Clyde Valley Electrical Power Co. are issuing £300,000 new capital. (Page 167.)

### The London Electrical Engineers.

(TO-DAY) THURSDAY, MARCH 20TH. *Easter Camp*.—Parade at Headquarters at 12.45 p.m. C. Company.—Recruit Training, 7 to 10 p.m.; Company Training, 7 to 10 p.m.

FRIDAY, MARCH 21ST (GOOD FRIDAY).—Headquarters closed.

SATURDAY, MARCH 22ND. Headquarters open for Regimental business from 10 a.m. till 12 noon.

MONDAY, MARCH 24TH (BANK HOLIDAY).—Headquarters closed.

TUESDAY, MARCH 25TH. B. Company.—Company Training, 7 to 10 p.m.

THURSDAY, MARCH 27TH. C. Company.—Recruit Training, 7 to 10 p.m.; Company Training, 7 to 10 p.m.

FRIDAY, MARCH 28TH. D. Company.—Company Training, 7 to 10 p.m.

SATURDAY, MARCH 29TH. Headquarters open from 10 a.m. till 12 noon.

### A BIG BIRTHDAY PARTY

LAST Saturday evening the General Electric Co., Ltd., celebrated the twenty-fifth anniversary of its inception by giving an "At Home" at the Royal Opera House, Covent Garden, at which their staff and a large number of the Company's friends and distinguished guests were present. The house was as full as it could be, and an excellent "star" variety programme was provided. The artistes included Lydia Kyasht, who gave a selection of her artistic and graceful dances; Edmund Payne and George Grossmith, who raised storms of laughter and applause by their modernised version of "The Two Obadiahs" and their make-up as Balfour and Lloyd George; Harry Tate and Co. in "Motoring," Ruth Vincent, Wish Wynne, the Hudson family, Harry Dearth, Barclay Gammon, Clarice Mayne, and the "Sunshine Girls." Some excellent cinematograph pictures showed the manufacture of Osram lamps, scenes at the Witton works, views of the G.E.Co.'s branches in various parts of the world and of their headquarters. The moving pictures of lamp manufacture were excellent, and considerable amusement was elicited by the view of the wrapping department working at express speed, and heralded by the motto, "Who said strength?" Another picture of even quicker motion showed how the works could be emptied of employees in two-and-a-half minutes at fire-drill. Among the films relating to the works at Witton a tinted one, showing a crucible being filled with molten iron in the foundry, and a series of pictures taken in the carbon works, were very fine indeed, in spite of the extreme difficulty that must have been experienced in taking them. Some moving pictures also gave an idea of the facilities for recreation enjoyed by the employees—cricket, football, tennis, pool, &c. It is, we believe, the first time that industrial cinematograph pictures such as these have been exhibited in public, and they impressed one both with the magnitude and diversity of the G.E.Co.'s operations and the care in providing for the comfort and recreation of their workpeople. It may be mentioned, in passing, that the gallery of the theatre was filled with workpeople selected on the basis of seniority. The series of pictures of the G.E.Co.'s branches all over the world were interesting in showing a more or less familiar building in different surroundings each time.

We must compliment the Company, and particularly Mr. H. Clifford Palmer, who acted as Organising Manager, on the excellent arrangements and organisation. Each guest was personally looked after, and all the 2,500 members of the audience, both ladies and gentlemen, felt "At Home" in every sense of the word, enjoying the very finest variety programme under the most comfortable and hospitable conditions.

Last, but not least, we must congratulate the Company on its twenty-fifth birthday. During the twenty-five years of the G.E.Co.'s existence it has, with its branches and affiliated companies, risen to be the largest electrical manufacturing company in the country, with a capital of over £1,000,000, and employing nearly 10,000 hands.

**How to Read a Meter.**—Judgment was formally entered on Tuesday in this action (ELECTRICAL ENGINEERING, March 6th, p. 128) for the County of London Electric Supply Co., on the claim and the counterclaim, with costs in both cases. The Company's meter readers had wrongly read a consumer's meter for 3½ years, with the result that only one-tenth the actual amount of current used was charged for. The Company's claim amounted to £1,880, but an agreement was come to by which this was reduced to £1,730.

**Institution Journal.**—At the meeting of the Institution of Electrical Engineers last Thursday, the President, Mr. Duddell, announced that the Council had decided to publish the *Journal* at fortnightly intervals during the session (from November to July). The shape is to be altered, and the size of the page is to be what is known as "quarto," viz., 10 in. by 7 in., or thereabouts; it is also announced that there will be no advertisements in it. A similar announcement was made at the dinner of the Birmingham Local Section last Friday.

The above depicts a deeply thought-out scheme of the Suffragettes for depriving the community of electric light by pouring water down the chimney to extinguish the fires.

## POWER SUPPLY ON THE RAND

A PAPER describing the undertaking of the Victoria Falls and Transvaal Power Co. and the Rand Mines Power Supply Co., by Mr. A. E. Hadley, was read at last Thursday's meeting of the Institution of Electrical Engineers. The author first outlined the history of the undertaking from the foundation of the former company in 1906, which, abandoning its original proposal of transmitting power from Victoria Falls, subsequently took over the undertakings of the Rand Central Electric Works and the General Electric Power Co., and acquired from Messrs. Lewis and Marks rights to establish a power station at Vereeniging. On the largest group of mines, controlled by the Rand Mines, Ltd., and Eckstein and Co., deciding to adopt electric driving, the Rand Mines Power Supply Co. was founded, but the entire capital was provided by the Victoria Falls Co., and the whole undertaking is run practically as one concern, with a combined peak load of 88,000 kw. and sales averaging 1,350,000 units per day (including a certain amount of power supplied in the form of compressed air through pipe lines). The price of supply to the mines is in most cases 0.525d. per unit, and it is stated that the introduction of the scheme has reduced the cost of production of gold by an amount varying from 6d. to 1s. per ton of ore milled. Motors aggregating 400,000 h.p. are installed, and supply is given to the town of Germiston, but not to Johannesburg itself.

The generating stations now at work are as follows, in the order in which they were built. Brakpan (two 3,000-kw. sets), Simmerpan (six 3,000-kw. sets), Rosherville (five 10,000-kw. sets and six 3,500-kw. steam-driven air compressors), and Vereeniging (four 10,000-kw. sets). Three

FIG. 1.—ANCHOR MAST.

FIG. 2.—INTERMEDIATE MAST.

7,000-kw. air compressors are also being installed at Rosherville and two more 10,000 sets are to be added to the Vereeniging equipment this year. At Robinson central station there are six electrically-driven 3,500-kw. air compressors. All the electrical generating sets are three-phase 50-cycle steam turbo-alternators, generating at such voltages as enable the stators to be constructed with one bar per slot and feeding the 40,000, 20,000 or 10,000 volt transmission lines through step-up transformers. The main transmission system consists of a 40,000-volt line stretching practically the whole length of the reef, and fed at four points, viz., Brakpan, Simmerpan, Rosherville and at Robinson Central, where the supply from Vereeniging joins the reef. At present, however, the extreme western end is worked at 20,000 volts. The main transmission line passes through two further distributing centres at Hercules to the east and Bantjes to the west. From these six points distribution networks, laid out as ring mains, supply the various sub-stations on the mines. The three eastern distributing stations supply the system through 10,000-volt overhead lines. The central portion of the area is served by an underground 20,000-volt cable system, and the western distribution network, as previously mentioned, is working at 20,000 volts by overhead lines. The

Vereeniging station is connected to the Rand by an 80,000-volt line approximately thirty-five miles long, terminating at the Robinson Central distributing station, where the pressure is transformed to either 40,000 or 20,000 volts, these pressures being also coupled together through transformers aggregating 16,000 k.v.a. The 80,000-volt line is carried on two rows of steel towers spaced 500 ft. apart on 10-in. suspension insulators, five in series. The conductors are 6-sq. mm. stranded copper with three earthed guard wires above them. Pin-type insulators are employed for the 40,000-volt lines. The 20,000-volt cables have three circular 100-sq. mm. conductors and are paper insulated, lead covered and armoured. All the circuits except the 80,000-volt line are protected on the Merz-Price system, without which a reliable supply on the ring main system could not have been given, and the more expensive radial type of network would have been necessitated. The control of the switching on the entire system is in the hands of a central "load dispatcher," who is in telephonic communication with every point.

The lightning conditions are particularly severe in the district and in the earlier stages considerable trouble was experienced, and the means now adopted to prevent disturbance are the employment of earthed overhead guard wires; earthing the neutral of each separate section of the system; and careful selection and adjustment of lightning arresters to deal with the different conditions arising. Most of the arresters are of the horn type, as at the time of the initial installation the aluminium arrester was not on the market. Some aluminium arresters have been installed since.

The generating stations are in general designed on the same plan, and a description is given in the paper of the equipment at Rosherville dam as being typical. Among its features is the completeness of the coal storage arrangements, and the use of the Pratt ejector system of induced draught to all the forty Babcock and Wilcox marine-type boilers with no less than twenty-four separate short steel chimneys. There are five A.E.G. turbo-alternators of 12,000 k.v.a., six steam turbo-compressors of 3,500 kw. and two more 7,030 compressors are being installed. The alternators run at 1,000 r.p.m. and generate at 5,000 volts. The switch-gear is in a separate building at one end of the station and is all of the remote-control type. Considerable trouble has been experienced by the effect of short-circuits on the switches, owing to the low internal reactance of the generators and transformers. The momentary rush of energy on short-circuit can reach 500,000–700,000 kw. No oil switch as at present designed could interrupt this rush of power unassisted. The intensely hot gases formed by the arc after rising through the oil come into contact with the air and cause an explosion, which more often than not is productive of a switch failure. Of the methods tried to obviate this difficulty the earthing of the neutral through a resistance has proved most valuable, as more than 90 per cent. of the faults start as faults to earth. On the first two Vereeniging machines two switches are employed in series, one introducing a non-inductive resistance; while on the last two machines, both of which have not yet been put into service, a two-movement reactance switch is being installed, constructed on the lines of an oil-break switch, but is provided with a second pair of contacts for the final break. The separation of the first pair of contacts introduces two reactances placed centrally, one on each terminal bushing inside the oil tank, and the second pair of contacts finally breaks the circuit. At some early date the system will also be sectionalised in order to reduce the rush of power on short-circuit, and in doing so reactances of relatively large value can be inserted between sections in those cases where it is not economical to separate adjacent sections permanently.

The electrically-driven compressors at Robinson Deep are each divided into two units on the same shaft and are driven by synchronous motors of 2,000 k.v.a.-capacity, running at 3,000 r.p.m. and designed to give a leading power-factor of 85 per cent., thus greatly improving the general power-factor of the system. Special motor-generators are provided for starting them up. Regulation is effected by throttling the intake.

The latter part of the paper is mainly devoted to the arrangements for the compressed-air transmission system, including interesting details of the methods of charging for and of metering the air, together with a few notes on the

transformer sub-stations on consumers' premises, of which there are sixty, varying in capacity from 2,000 to 10,000 k.v.a.

### DISCUSSION.

Mr. J. A. ROSENTHAL (Babcock and Wilcox), in the course of his remarks, pointed out there was in the station described in the Paper 1.19 kw. produced per square foot of space, which he believed was a record. The nearest to this was at Dunston-on-Tyne, where the figure was 1.12 kw., and the next was Lots Road, 0.72 kw. Boilers arranged in bays at right angles to the engine-room were first adopted at Carville, and had since been repeated in a large number of stations all over the world.

Mr. H. BRAZIL (Charing Cross, West End and City Electricity Supply Co.) asked whether it was a fact that in the original line near Johannesburg ordinary barbed wire was used for guard-wire purposes, and wanted some further information regarding the lightning-protection equipment. The effectiveness of earthing the neutral largely depended upon whether the disturbances were unidirectional or oscillatory, in view of the inductance of the generators.

Mr. A. P. TROTTER (Electrical Adviser to the Board of Trade) said that what we suffered most from in this country was the necessity for putting up transmission lines on such a small scale that stringent economy became necessary, and introduced difficulties which were not dreamed of on a large scheme such as that described in the paper. It did one's heart good to see a job which could afford two rows of poles side by side and protective gear throughout the whole system, as well as a ring main to keep up the supply in case of a shut-down on any part. He had always advocated the use of earthed guard wires. He asked whether there was any special reason for the 24 ft. 6 in. clearance from the ground for the wires. He should have thought that 20 ft. was sufficient.

Mr. J. S. HIGHFIELD (Metropolitan Electric Supply Co.) referred to the co-operative method of fixing the charge, and said that the action of the Rand mine owners in substituting for their individual power plants supply from the public mains showed that the case for electric-power generation and distribution on a large scale had been proved up to the hilt. At the same time, the figure of 0.525d. given in the paper did not seem low. His opinion was that the guard wires should be of similar material to the line wires.

Mr. A. JACOB (British Aluminium Co.) reckoned that the factor of safety allowed for on the overhead system came out at about 2, which was very much less than it was in this country. The towers seemed to have extremely long arms at the top, and in the event of any mishap to the conductors there

would seem to be great torsional stress on them. He had worked out for comparison that a line of copper conductors, using rigid towers at 80,000 volts, would be £956 per mile, and a similar aluminium line £926 per mile, showing a saving of £30 per mile. This would be still more increased if towers of similar construction to those in use in South Africa were adopted. He asked the Author if there had been any trouble from corona losses, because he had heard of cases with 80,000 volts transmission where there had been serious trouble from this cause, and where it had been necessary either to increase the diameter of the conductor by the insertion of a hemp core or to employ aluminium, which had a greater diameter by some 20 per cent. than the copper equivalent.

Mr. V. O. DAVIS dealt mainly with the compressed-air system, and expressed his agreement with the adoption of synchronous motors for driving the compressors.

Mr. E. V. PANNELL (British Aluminium Co.) contrasted the type of tower that was now practically standard in America with that described in the Paper, and thought the former would come out the cheaper. In America, he said, they have abandoned the equilateral arrangement of conductors, and he wished to know whether in South Africa this method was considered vital in connection with the balancing of the circuits. The use of concrete for foundations represented 50 per cent. of the cost of the tower, and if this could be done away with it would be a great advantage from an economic point of view. A guard wire was as essential from the mechanical as from the electrical point of view. He deprecated the use of a cheap material for the guard wires, and instanced a case on the Central Colorado transmission lines where a serious short had occurred from the breaking of the guard wire.

Mr. ARTHUR WRIGHT looked forward to the time when the whole of the transmission lines in South Africa would be underground, as this was the only way of avoiding troubles due to atmospheric conditions.

Mr. A. E. HADLEY, in reply, said that a 24 ft. 6 in. height was necessary to comply with the regulations. There was a time when they thought they would have had serious legislative difficulties, but the final Act which had been passed was as fair as could have been expected. He would have liked to have seen the price of 0.525d. five or six per cent. higher for the next two years, and then to be reduced to 0.525d. In criticising this price, they must remember the difference in the purchasing power of money in South Africa and in this country. The contracts provided that after 6 or 6½ per cent. was paid upon the Company's capital, any surplus was divided between the consumer and Power Company as to ¼ and ¾ respectively. There were other clauses in the contract providing for variation in price according to the cost of railway freights, &c. They used galvanised steel for guard wires. The factor of safety was not 2, but 5; and in further answer to Mr. Jacob he said that experiments had been made on each class of pole line, so that all the wires on one side of the pole were broken simultaneously, and on none of them was there any twisting of the arms. There had been no corona loss. He did not agree with Mr. Pannell that pole lines in America were becoming standardised, and he had seen most of the systems recently, including the Central Colorado. He did not agree with Mr. Wright as to placing the lines underground, as each year there was less and less disturbance by lightning.

## BREAKDOWN ON THE L.C.C. TRAMWAYS

AN unfortunate chain of accidents resulted in the interruption of the London County Council tramway service for an hour at the time of heaviest traffic on Monday, last week, and a diminution in the service a few days later. The primary cause of the breakdown on the Monday afternoon was a short-circuit on the temporary connections to a checking meter for testing the meters in the Greenwich power house. These leads were connected at one of the isolating plugs on the main switchboard, and the arc flashed across on to two adjoining generator cells. The serious arc on the switchboard fused a considerable amount of copper on to the insulators, and, in addition, some of the stator coils of one of the large 3,500-kw. generators driven by the reciprocating engines broke down. It took about an hour to get things in running order again, and the service was then renewed.

Two days later, however, it was found that the strain had damaged the insulation on the stator connections of one of the 5,000-kw. turbo-generators as well, and this went to earth. The capacity of the station was thus reduced by 8,500 kw., and at present there is practically no reserve, so that, although a limited amount of current could be obtained on a few overhead sections which adjoined lines run by neighbouring local authorities, it was necessary to diminish the car service, and over 100 cars had to be taken off on various parts of the system to lighten the load.

It is anticipated that the necessary repairs will have been completed and normal service resumed early next week.

## ELECTRIC COOKING AND HEATING

A PAPER entitled, "The Commercial Aspect of Electric Cooking and Heating," by Mr. T. P. Wilmshurst (Borough Electrical Engineer, Derby), was discussed on Feb. 26th by the Birmingham Local Section of the Institution of Electrical Engineers. The author referred to the great progress which had been made by gas cooking, which was first in the field, and said that until recently electric cooking was to all intents and purposes non-existent. Much of the early apparatus was designed without due regard to the conditions under which it was to be used. He thought that much of the recent progress was due to the foresight of Mr. A. F. Berry, who originated the "Tricity" apparatus, and to the excellent demonstrations made with it round the country by Mr. F. S. Grogan. At Derby, for example, only two cookers were on the mains before Mr. Grogan's visit, but over thirty consumers adopted electric cooking within two months. Mr. Wilmshurst summed up the main advantages of electric cooking as follows:—Absolute cleanliness. Absolute certainty of results, owing to the voltage limit restrictions laid down by the Board of Trade. This is in marked contrast with the results obtained with gas cookers, owing to the wide fluctuations of gas pressure in practice, or with the results with coal ovens. With the "Tricity" system absolute evenness of temperature is attained by a simple arrangement of deflectors fixed under the top heater and over the bottom heater. With an electric cooker it is only necessary to weigh the joint and allow

FIG. 1.—HEATING ELEMENT FOR RAPID BOILING KETTLE.

fifteen to twenty minutes per pound, according to taste, and at the predetermined time the joint is taken out with the certainty that the meat will be cooked perfectly and without the door of the oven having once been opened. A saving owing to the diminished loss of weight as compared with other methods was another important point.

He particularly dwelt on the last advantage, giving some striking figures, and mentioning one case where the saving in meat as against coal-fire cooking was so great as to far outweigh the cost of current at 1d. per unit. In some electric cooking outfits there is no provision for boiling small quantities of water with rapidity. To meet this difficulty a neat arrangement has recently been devised by Mr. Berry. A specially-shaped kettle is used, into which can be inserted a cartridge element (Fig. 1). The resistance strip is wound on a copper tube covered with a layer of pure mica, the connecting leads consisting of four strands of the element laid along the tubes in longitudinal grooves so as to prevent lumps. Over this strip is wound two layers of thin copper tape insulated from the winding by pure mica. A brass cap, fitting tightly on the tube and then opened out to slip over the tape, finishes one end; and at the other end is a brass terminal box, which carries the contact pins. When all the parts are assembled the whole apparatus is soldered up solid and watertight. A smaller tube is fixed down the centre of the main one into the plug closing the end carrying the terminal box, and has holes at the bottom end: the other end carries a small "umbrella." This arrangement allows the water to circulate inside, the "umbrella" preventing the outflowing stream interfering with the cold water entering. The loading is 1,200 watts, and this can be

assisted by standing the kettle on the hot-plate. With an initial temperature of 40° F. three pints of water can be boiled in six minutes with 2,000 watts, at an efficiency of over 98 per cent.

In Derby the rents charged for hired cookers are as follows: For an outfit including "duplex" extension heater and oven, 4s. per quarter; including griller and grease pan, 4s. 3d. per quarter; additional extension heater, 1s. 4d. per quarter. The small utensils used in conjunction with the hot-plates are sold outright at prices approximately 10 per cent. above net cost. The consumption of energy with the "bright" oven usually amounts to 1 to 1½ units per person per day, and at 1d. per unit the author believes this will compete with gas at 2s. 6d. per thousand cubic feet. With electricity at ½d. or ¾d. per unit there was no question of the economy of electric cooking.

After a few words on radiators, the author passed on to electric water heating, which financially was the most difficult problem to deal with. He pointed out the much higher efficiency of electric heaters over coal or gas, and proceeded to describe the "Therol" heater in which an even load factor is obtained by the provision of considerable heat storage capacity; the Belenus boiler, which can be fitted to existing hot-water systems, and the Belling geyser (see ELECTRICAL ENGINEERING, Vol. VIII., p. 324, June 13th, 1912), in which the water-supply and electrical control are interlocked. These appliances brought the hot-water problem within the range of practical engineering, but the cheapest solution was to discard the coal fire altogether, to use a coke stove for water heating and to cook by electricity. In conclusion the author considered briefly some of the various systems of charging, of which he considered that the two best were the "Norwich" system and the "Telephone" system. Once a satisfactory price could be obtained, he said, the load would follow as a matter of course.

Mr. F. S. GROGAN (British Electric Transformer Co.), in opening the discussion, deplored the practice of small supply authorities of experimenting with cooking apparatus rather than accepting manufacturers' wares. He was a strong advocate of cooking demonstrations of such a nature as to teach the public to apply their existing knowledge to electric cooking, besides giving definite costs. Referring to the saving effected by diminished loss in weight, Mr. Grogan emphasised the fact that a joint of meat, once seared, is better cooked at a lower temperature, and it is for this reason that far less shrinkage occurs. He guaranteed to lose only 10 per cent. in weight in the cooking of a joint, as against 25 per cent. to 35 per cent. loss by gas-cooking, a great point against the ordinary gas-cooker being the difficulty of rapidly lowering the temperature owing to the large amount of heat stored. An interesting instance of electric cooking was given of a school where the energy required to cook for 100 boys worked out at ½ unit per day per head. He had been informed that at Southampton 75 per cent. of the cookers let out on hire had been thereby sold.

Mr. ELLIOTT, referring to water-heating, stated that 3 units were necessary to raise an ordinary water bath (25 gallons) from 60° to 100° F., and mentioned an interesting device whereby the temperature was kept constant by a thermometer automatically operating a relay which regulated the current for the heater.

Mr. PHILLIPS thought that the explanation of the reduced shrinkage in meat cooked electrically lay in the fact that, as there were no noxious fumes, no ventilation was necessary.

Mr. FENNEL (Borough Electrical Engineer, Wednesbury) was favourably impressed with both the "Tricity" and "black" types of cooker after two years' experience with both, very even results in cooking being obtainable; he thought that the saving in weight, being only water, was of little account, and considered that there was much in favour of auxiliary cooking apparatus, such as toasters, grillers, &c., but was convinced that there was a great future for an electric oven which could be purchased for £4.

Mr. MORRISON (Electric & Ordnance Accessories) stated that the demand for electric cooking apparatus was far greater in the Colonies than at home. He thought "black" a poor term, since many cookers so called were vitreous enamelled inside and outside; he gave some figures obtained from a cooker of this type showing the "shrinkages" to be approximately the same as those given by Mr. Wilmshurst. He considered that, in view of the 100 per cent. load-factor, supply companies should afford a special low rate for water-heaters.

Among other speakers, Mr. N. B. ROSHER (Messrs. Moffett & Rosher) expressed unfavourable views as to electric cooking. Dr. C. C. GARRARD (General Electric Co.) thought that the "black" lagged oven must certainly be more efficient than the so-called "bright" type. He considered that the water driven off was not in a "free" state, and therefore represented a real loss. Mr. DEWSBURY found that electricity at 0.75d. was equal

to gas at 1s. 11d. per 1,000 cubic feet. Mr. W. E. Milns advocated the necessity of a cheap and durable oven with heating elements easy of replacement, and advocated metallic braided flexible cord. He gave, as his own experience, the figure of 82 units per week for five people, which included all household cooking and heating for November except baths; he found the cost to be about 15 per cent. more than gas for electric cooking. In any type of electric oven the wastage in meat was 10 per cent.

## RECENT DEVELOPMENTS IN THE STREET LIGHTING OF MANCHESTER

(Discussion in London, continued from p. 142 of last issue.)

Professor J. T. MORRIS (East London Technical College) said that some years ago he had made a series of tests in his laboratory on high-pressure gas lamps, and the figures he got were almost exactly corroborated by the tests mentioned in the paper. As a rule, high-pressure gas lamps did not give their guaranteed candle-power. He had worked out from the figures in the Paper that, in the case of electricity, 60 to 65 per cent. of the cost was for current, whilst in the case of gas 80 per cent. was for the cost of gas used. Trimming and maintenance for the arc lamps came to 7 to 8 per cent., against 13 per cent. for gas, and, finally, carbons in the case of the arc lamp accounted for 28 to 30 per cent. of the cost, whilst in the gas only 7 per cent. could be attributed to mantles; but it must be borne in mind that this 7 per cent. referred to lamps which gave half the proper candle-power, and it was very obvious that as the candle-power was brought up, the life of the mantles would be shortened very largely.

Mr. J. S. DOW (Assistant Hon. Sec. Illuminating Engineering Society) said that the rays which caused the most glare were those at the small angles from the horizontal, which were also the ones required for a uniform illumination. He, however, was an advocate of even illumination. He supported the metre as the standard height for measurements of illumination, both because it was recommended by an International Committee on nomenclature, and because it was the height always used for indoor measurements.

Mr. S. L. PEARCE, in reply, dealt briefly with a few of the points raised. As to lowering gear, Portland Street was adjacent to the Dickinson Street Works, and consequently it was an easy matter to run out a tower wagon. Further, they had no compulsory powers for making fixtures to the house fronts, and there might be difficulty in getting permission to fix winches, &c. With regard to the question of cost raised by Mr. Seabrook, the figures given simply showed the actual cost to the department; they included allowance for a contribution to reserve and rate aid. Replying to Mr. Harrison, he said that the pressure of gas in Manchester was 55 to 60 inches water gauge, which was substantially lower than the pressure used in London, but even with this reduced pressure there was a very considerable amount of leakage from the high-pressure mains. He thought the time had gone by when the gas people claimed anything like 50 or 60 candles per c. ft. He believed that quite recently Mr. Goodenough himself had dropped the figure down to 40, and even that was on the high side. The calorific value of the Manchester gas was 550 B.Th.U. gross and 500 net. In reply to Mr. Bailey, the graded frosting on the globes did not diminish their life.

Mr. RATCLIFF also replied to some of the points raised. He disposed of Mr. Dow's remark as to glare by pointing out that at the smaller angles one did not see the naked arc at all.

Mr. A. P. TROTTER, in a written communication, said that the difference between the illumination by electricity and gas in the two trials in Manchester was imperceptible without a photometer, and the price was in favour of electricity. Where an illumination (on a horizontal plane 3 ft. 3 in. from the ground) of half a foot-candle with a ratio of maximum to minimum of  $3\frac{1}{2}$  is wanted, this was an excellent way of doing it, but it must not be assumed that so high an illumination was always required, or that a capital expenditure of £1,500 per mile of street and £250 per mile per annum was necessary. For the measuring of illumination, a direct-reading illumination photometer would have been less cumbersome and fatiguing than the one used by the Authors. To say that a dioptric shade has a strongly defined optical centre was to admit that it was intelligently designed; but he had seen dioptric shades offered for street lighting in which no intelligence had been used in the design, and had seen well-designed shades so unintelligently used as to defeat the intended effect altogether. With a fixed focus arc there should be no difficulty in setting the shade as the inventor or designer intended. He had long ago changed his opinion about the value of uniform illumination for street work, and considered a street to be more usefully lighted when the ratio of maximum to minimum is 15, or even greater. The graded frosting was simple and effective, but was like regulating the speed of a steam engine by a brake instead of by the steam admission.

## DISCUSSION IN MANCHESTER, FEBRUARY 25TH.

Dr. E. ROSENBERG (British Westinghouse Co.) thought the lighting in Mosley Street and Portland Street bore evidence of competition, for the degree of illumination was too great; the glare in Portland Street and Mosley Street was equally bad.

Alderman WALKER said that Manchester had actually been losing money on street lighting since 1904, because the Gas Committee was the illuminating authority. They used at present 0.23 unit per head of population for street lighting in Manchester, compared with 6 units per head in Edinburgh. To the list of advantages of electric lighting over gas, should be added the great point of reliability. The report of the gas expert claimed for the gas lamps, "freedom from involuntary extinction," but the report showed that while out of 16 arcs, only two were out for about one hour each during the period of the tests, out of the gas lamps, two were out all night, and others for half an hour or one hour.

Mr. H. R. BURNETT (Barrow) considered the figure of 3.25d. per trim altogether too low. Adding capital charges, the cost of the electric lighting system described worked out at £500 per street mile, which was much more than most towns could afford. A 0.5 foot candle standard adopted was too high, and quite unnecessary. Its use would entail the raising of the standard for the side streets, and would be thus still more expensive. There was a critical point where metallic filament lighting became cheaper than arc lighting.

Mr. A. E. ANGOLD (G.E. Co.), on the question of globes, said that the glass should be so shaped that the reflection of the arc could be seen in it when looked at from a constant angle. Glare should not be so very noticeable. Frosting the inside of the globes spoilt the reflecting qualities.

Some questions were then asked on various other points by Dr. Zettell (G.E. Co.) and Mr. E. M. Hollingsworth (St. Helens), and Mr. H. T. Wilkinson (Wardle Engineering Co.), spoke in favour of overhead suspension of the lamps over the centre of the road. Mr. R. G. Cunliffe (Manchester Tramways) was also in favour of this, and said that from the point of view of street users the glare from the centre lighting did not strike into the drivers' eyes, and the result was that the speed was very much increased.

Dr. E. W. MARCHANT (Liverpool University) thought from the results of some tests, that the frosted globes absorbed much more light than was commonly supposed.

Mr. S. L. PEARCE, in reply to some questions, said that to the gas costs, the bye-passes were not included, and all leakage was eliminated. The maintenance costs were borne out by their experience, and were perhaps accounted for by the proximity to the station. There was always a great loss to tramways through the slowing up of the cars owing to traffic congestion, and it appeared to him that better illumination might do something to reduce this at night. Mr. H. A. Ratcliff also replied.

## DISCUSSION IN BIRMINGHAM, MARCH 12TH.

Mr. R. A. CHATTOCK (City Electrical Engineer, Birmingham) said that the figures of candle-power given corroborated the general impression among electrical engineers as to the inaccuracy of the claims made by gas people. It was well known that electric lamps gave their full rated candle-power. The results obtained with street arc lighting in Handsworth (Birmingham) agreed generally with those given in the Paper. The absence of candle-power between 80° and 90° in Fig. 4 could be remedied by using lamps with two carbons, one vertically over the other, instead of the converging type usually employed. In this case the bottom carbon was positive.

Mr. E. CROCKER (Birmingham Electricity Department) commented on the extremely low variation factor (3.75) obtained with the frosted globes used. He had taken some measurements in a road lighted with incandescent gas lamps, and found the variation factor as high as 18.

Mr. M. SOLOMON (G.E. Co.) pointed out that the curves in Figs. 1 and 2 agreed extremely closely with those given in his Paper on flame arcs, which were deduced from laboratory experiments. He considered that the shape of the inner globe finally adopted had as much effect in improving the distribution as the alterations in the shape of the spinings and the outer globes.

Mr. A. M. TAYLOR (Chairman) suggested that there was need for a further factor in addition to the variation factor in order to indicate the rate of change of the illumination.

**I.E.E. Students' Section.**—The unique informal dinner held on Friday evening last at the 'Tricity House' was a most enjoyable function. Both the dinner itself, the musical items provided by the Students of the Institution, and the speeches, were apparently thoroughly enjoyed by everyone present. Among the toasts may be mentioned those of "Electric Cooking" and "Point Five Juice," which were proposed in short, humorous speeches, the former by Mr. S. M. Hills and the latter by Mr. G. W. P. Page, who was the originator of this all-electric dinner. The former toast was responded to by Mr. C. H. Smyth (Mains Engineer, Marylebone Electricity Supply) in a more technical vein, and the latter by Mr. J. Mould, who made some jocular remarks. The Chairman of the Students' Section, Mr. J. C. Rennie, presided, and the active Hon. Secretary, Mr. E. T. Driver, was also present.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelopes.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,331.

What formulæ are generally used in the design of fans for cooling the windings of alternating-current motors? Have any recent papers or articles been published upon this subject?—"INQUISITIVE."

(Replies must be received not later than first post, March 27th.)

### ANSWERS TO No. 1,329.

In a workshop with 2-phase, 4-wire installation, two single-phase meters are provided by the Supply Co. for purpose of charging. A two-phase meter is also connected for checking purposes. The load is mixed, and consists of: (a) lights; (b) some two-phase induction motors; and also (c) a single-phase motor. It has been found that the meters agree when (a) and (b) are running, but when (c) is switched in the single-phase meters register less than the two-phase meter. The meters have been tested separately and found correct.—S. C. R.

The first award (10s.) is made to "OHM" for the following reply:—

As the actual discrepancy between the readings of the two single-phase meters and the reading of the two-phase meter under case (c) is not specified, it is only possible to suggest a probable explanation of the observed difference in the registrations. Obviously the meters have been correctly connected in circuit, for otherwise the readings would not agree under cases (a) and (b). In view of the fact that all three meters when tested separately were found to be reading correctly, it certainly does seem remarkable, on the face of it, that the consistency of the readings should be destroyed by simply altering the load conditions as under (c). The trouble, I think, rests with the two-phase meter. No particulars regarding its construction are given, but presumably it comprises two single-phase meter elements in accordance with standard practice. It would be interesting to know whether the two elements operate both on one disc, or if each element acts on its own disc, the two discs being connected to the same spindle. Both constructions are adopted in practice, and whilst there is theoretically no difference between them, there is actually a considerable difference, due to the fact in the former case it is practically impossible to entirely eliminate the interaction between the two driving elements. There is, as a matter of fact, a slight interaction in an ordinary two-disc meter, but with a good design this would be very small on balanced loads. The two-phase meter was probably tested on a single-phase circuit by coupling the two meter elements in series. On this assumption, "S.C.R." would most likely find, if the meter was tested on a two-phase circuit so as to reproduce exactly the operating conditions, that it was reading considerably in error as a result of the interaction effect referred to above. Under working conditions this error would not be serious so long as the two circuits were fairly balanced. This condition of affairs, I take it, exists under cases (a) and (b). As soon, however, as the single-phase motor is switched

on, the load on one phase will be much greater than on the other, and the error in the reading of the two-phase meter, as a result of interaction, will manifest itself. Hence the discrepancy in the readings observed.

The second award (5s.) is made to "J. E. R. R." who writes as follows:—

One thing that will account for the speeding-up of the two-phase meter is magnetic interaction between the two integrating elements. Magnetic flux strays from the current coil of one element to that of the other and affects the speed of the discs. This interaction may be very slight, probably nil, when each element is equally loaded and each current lags its voltage equally. This will occur when the lights and two-phase motors are in use. When one element is given a larger and lower power-factor current, the interchange of flux may be appreciable and affect the accuracy of the instrument, which will happen when the single-phase motor is switched on, but, under the same conditions, no such interaction can occur with the single-phase meters, and they should still read correctly. In a paper read before the Institution of Electrical Engineers on March 23, 1911, on the subject of Meters (see ELECTRICAL ENGINEERING, Vol. VII., page 163, March 30th, 1911), the results of tests

FIG. 1.—1-PHASE MOTOR ON PHASE B.

FIG. 2.—1-PHASE MOTOR ON PHASE A.

on various meters for this interaction were given. It was found that when one element had a different power-factor to the other the meters read incorrectly, and that varying this difference of power-factor varied the percentage error. No matter which phase we switch the single-phase motor on, the meter would read fast, for it would alter the power-factor of one current somewhat, as shown in Figs. 1 and 2, from which it will be seen that the phase difference between the currents may be approximately  $120^\circ$  or  $55^\circ$ , either of which conditions will speed up the meter and make it read more than the sum of the two single-phase meters. The question states that each meter has been tested and found correct. No doubt the test has been carried out on the two-phase meter with the P.F. of each element equal, or possibly on unity P.F.; in either case this interaction would be exceedingly small. It has been found that this interaction does not exist to the same extent in all makes of instruments. It depends a great deal on the construction of the magnetic circuits and the nearness of one element to the other. In some makes of instruments its effect is negligible for all practical purposes, whilst in others it may amount to 5 per cent. The percentage error will also vary with the load, being greatest on the lower loads. The fact remains that very few meters are free from this interchange of flux when the power-factor of the current in one element differs from that of the other, and it is always advisable before using polyphase meters on inductive or mixed loads to first check them with two reliable single-phase instruments on the kind of load they are to work on. In this instance it will be more reliable to take the sum of the two single-phase meters as being the more correct reading of the power.

## A NEW MULTIBLADE EXHAUST FAN

THE General Electric Co. (67 Queen Victoria Street) have put on the market an improved type of electric fan which is a combination of the "Freezor" exhaust fan motor and Pitters Patent blades. The multiblade principle calls for a proper arrangement of a number of narrow blades, one behind the other, in position according to pitch and curve of the blades. The effect is that the total volume of air displaced by each group of blades is far larger than that by a single blade of the ordinary type, the resistance is much less and no eddy currents are formed. A considerable increased efficiency is thus produced.

A comparative test has been recently taken with an ordinary 18-in. box blade and with an 18-in. three-way Pitters blade fan; both have been run with the same motor and under the same conditions, at speeds of 656 r.p.m. and 671 r.p.m. respectively (the speeds on the multiblade fan going up slightly, as the resistance is less), with an energy consumption of 84 watts in both cases. The former displaced 1,455 cub. ft. of air per minute and the latter displaced 2,210 cub. ft. of air per minute. The air measurements were taken 2 ft. away from the fan on the input side, and not in close proximity to the blades on the outside, as is usually the practice, and under which condition naturally higher figures can be obtained. The Company point out that as far as economy is concerned the introduction of this fan is doing to the electric fan industry what the Osram lamp did to the electric light industry—it effects a saving in the same manner, for, with the same amount of current, a greater volume of air can be circulated, or, to put it another way, the same volume of air as is now being circulated with an ordinary box-blade fan can be circulated at a far lower current consumption.

## THE MANUFACTURE OF WOTAN AND TANTALUM LAMPS

AT the invitation of Siemens Brothers Dynamo Works, Ltd. (Lamp and Fittings Department, Tyssen Street, Dalston, N.E.), we had the pleasure on Tuesday of being present at a most interesting private exhibition of the new "industrial" cinematograph films, that have been prepared to show the processes of manufacture of Wotan and Tantalum drawn-wire lamps. The demonstration was given at the studio of Messrs. Pathé Freres, Ltd., where we were most hospitably received by Mr. H. A. Pryor and other Siemens friends. Considerable difficulties were encountered in the taking of these photographs, involving as they do representations both of very small articles and rapidly moving machinery near to the camera, but these have been well surmounted, and an excellent series of films has resulted, which is bound to be popular when exhibited throughout the country. The films are confined to the operations actually carried out at the works at Dalston. We are first given an idea of the scale on which all this is being done by exterior views of the works, some showing the army of employees leaving at the dinner hour and some streams of railway vans laden with lamps. We then follow the various operations forming the building up of the lamps themselves. Expert glass workers are seen making the necks, the supporting spiders, &c., preparing the bulbs for their reception, and adding a tube on the "pip" end for exhaustion. It was also shown how some of these operations can be carried out at higher speed by ingenious machines. Other employees are shown winding the wire on to the spiders and sealing the completed neck, support and filament into the bulb, an operation which is also carried out by machinery as well as by hand. The sealing off of the lamp after exhaustion was next shown, and the subsequent cap-mounting, stamping, testing, inspecting and packing operations. These films should open the eyes of the public as to the number and complexity of the processes employed in lamp making. They are indeed a revelation as regards both the skill and speed of the workers and the ingenuity exhibited in the machines, and they reflect great credit on the department and its energetic manager, Mr. E. P. Barfield.

**Electrical Trades Benevolent Institution.**—We have received a copy of the annual book of reports and list of members, subscribers, &c., from this institution, which reflects very satisfactory progress during 1912. A special letter of appeal signed by Sir William Preece is being issued in connection with the forthcoming festival dinner.

## CATALOGUES, PAMPHLETS, &c., RECEIVED

**VARIOUS INSTRUMENTS.**—A new list issued by The India Rubber, Gutta Percha & Telegraph Works, Co., Ltd. (100-106 Cannon Street, E.C.) gives particulars of some of the company's well-known instruments. Included are telegraphic apparatus—Wheatstone, Morse, tapper keys, pole-changers, &c., as well as the Raymond-Barker multi-tone vibrating transmitter, lightning protectors, testing apparatus of all kinds, and various accessories. Water-level indicators and Walker's train describers, semaphore repeaters, and bells for railway, mining, and other purposes are also listed.

**TELEPHONES.**—A leaflet from the Sterling Telephone & Electric Co. (200 Upper Thames Street, E.C.) gives particulars of watertight magneto-ringing mining telephones in flameproof cast-iron cases.

**RISE AND FALL PENDANTS.**—A new list illustrating a number of rise and fall pendants suitable for dressing-rooms, &c., has just been issued by Siemens Bros. Dynamo Works, Ltd. (Tyssen Street, Dalston, N.E.). All the fittings are of artistic design, and some are very handsome. The prices also are quite moderate.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**MERCURY VAPOUR LAMPS FOR CINEMATOGRAPHS.**—The advantages of Mercury vapour lamps for use in connection with the production of cinematograph films are set forth in a leaflet from the Westinghouse, Cooper, Hewitt Co., Ltd. (80 York Road, King's Cross, N.), who will be pleased to supply additional information on this subject.

**WIRES AND CABLES.**—A sectional catalogue from Simplex Conduits, Ltd. (116 Charing Cross Road, W.C.), gives prices and particulars of wires and cables of English manufacture, including the usual grades of vulcanised indiarubber insulated wires and cables for electric lighting, flexible cords, and bell wires.

**REFLECTORS.**—The new catalogue of "Sunlite" and "Sunline" reflectors of the Sun Electrical Co., Ltd. (118 and 120 Charing Cross Road, W.C.), is one of the most complete that has been issued. In addition to the well-known standard lines of these reflectors, a large variety of special patterns for facia lighting, concealed lighting, picture lighting, &c., are included. For the last-mentioned purpose, a new reflector, particularly unobtrusive in appearance, has been introduced which gives very even illumination without glare from the top of the picture only. A variety of small window fittings are listed. Outside lanterns and reflectors are also dealt with, and a few pages are devoted to suitable incandescent lamps.

**ELECTRIC HEATERS.**—A leaflet from H. S. Martin (74 Great Ancoats Street, Manchester) depicts by the aid of vivid colour-printing one of their "Redglo" electric fires, with its glowing hemispherical centre.

**Alternating Current Magnets.**—A Paper by Prof. E. Wilson on this subject was read at a meeting of the Physical Society on February 28th. The pull of an alternating electromagnet is unidirectional and intermittent, and means should be provided to reduce the consequent chattering and vibration. In the present experiments a phase-splitting device has been adopted, and consists in surrounding a portion of the pole-piece of the magnet with a short-circuited "shading" coil. The effect of this is to alter, not only the relative amplitudes, but the phase of the magnetic fields passing through the shaded and unshaded portions of the pole-face. The magnet used in the experiments varies the length of its gap when in action, and the influence of the gap length upon this phase-displacement has been studied. When the resistance of the shading coil is such that the magnetic induction over the whole face is substantially uniform and the gap closed, the phase-displacement is 72 electrical degrees. A gap length of 0.15 cm. reduces the phase-displacement to 18 deg., and consequently the minimum or "hold on" pull drops. The arrangement of the shading coil above described is very effective in preventing vibration and chattering. With constant alternating voltage impressed upon the magnetising coils of the magnet the net pull exerted diminishes rapidly at first as the gap length increases and tends to become more nearly constant. The R.M.S. amperes, on the other hand, steadily increase as the pull diminishes owing to the increase in the gap length. The observed net pull in the case of the magnet experimented upon is less than the calculated average pull, varying from 83 to 59 per cent. as the gap length varies from 0 to 1 cm.

# ADAMS IGRANIC

ELECTRIC-MOTOR CONTROL GEAR FOR STEEL MILLS.

MFG CO LTD  
BEDFORD  
AND  
LONDON

## ELECTRIC TRACTION NOTES

The electric traction equipment of the East London Railway, which is hoped to be ready for use at the end of this month, follows in general the lines of that of the District and Metropolitan Railways, in conjunction with which it will be worked. There are, however, some points of novelty in the automatic signalling arrangements, which were installed by the McKenzie, Holland and Westinghouse Co. According to the *Railway Gazette*, the track circuits are worked by alternating currents, eliminating the possibility of the system being adversely affected by extraneous currents. Lamp signals are employed in the tunnels, and semaphores in the open. The former are provided with red and green Fresnel lenses, behind each of which incandescent lamps are placed. These lamps light up alternately in accordance with the desired control. It is not possible for both sets of lamps to burn at the same time, as the voltage of the lamps giving the danger indication is considerably lower than the voltage of the lamps for the "clear" indication. Train stops are provided at each stop signal, and both these and the semaphores are worked by small A.C. series motors. The electrical supply for the signals and track circuits is obtained from the sub-stations at Whitechapel and Surrey Docks. The transmission voltage is 440, and transformers are provided for effecting the necessary reduction for tracks and signals. The voltage for the track is about 1.5, for semaphore signals 50, and for lamp signals 50 for green and 5 for red.

Petrol-electric motor omnibuses are being tried in Hastings with a view to their adoption on the front, where the dolter surface-contact system has given so much trouble. It is stated that the Board of Trade has intimated its intention to condemn the dolter system in six months' time.

Before the Budget Committee of the German Parliament, the Minister of Public Works stated that the lighting of railway coaches with accumulators and metal filament lamps was now as cheap as lighting with gas mantles, and would shortly be much more largely employed on the State railways.

**Lighting of the Institution Lecture Theatre.**—Many of our readers who attend the meetings at the Institution of Electrical Engineers in London will be glad to hear that a Committee was appointed about two months ago to consider the lighting of the lecture theatre, with a view to its possible improvement, and that some experiments are being made.

**Heating and Cooking Apparatus.**—An interesting and instructive Paper on this important branch of the electrical industry was read by Mr. S. M. Hills on March 5th, before the Students' Section of the Institution of Electrical Engineers. The temperature of a room five feet from the floor should be 60° F., when heating is arranged by convection, said the author, but 55° F. was sufficient if radiant heat was used. It was pointed out that a  $\frac{1}{2}$  kw. radiator in each of the four corners of a room would produce the same heating effect as a 2 kw. radiator in the fireplace, while the air would be more uniformly heated. Convectors were usually perforated at the top to assist ventilation. This allowed dust to collect in the resistances, which on the temperature reaching a certain point was decomposed, thereby emitting a disagreeable odour. The ideal system of heating would be to make the floor a uniform heat radiator. The hot panel or border system would appear to offer advantages to electrical heating, as the loading would be low, and the heat evenly distributed. The hot borders are made of iron from 6 in. to 18 in. wide, and run along the floor close to the walls. The author then discoursed on cooking apparatus. A cooker to be useful must, he said, consist of a top plate containing three boiling plates and a grill; a hot cupboard between the top plate and the oven; an oven; a rapid water boiler; a control board. The switchboard should be on the wall on the same level as the oven, not above it, so as to be unaffected by steam, &c. The loading of the boiling plate should be between 20 and 25 watts per sq. in., the limiting factor being that mica insulation will not stand a prolonged temperature above 600° F. For the grill 12 to 15 watts per sq. in. would be sufficient. A loading of 1 kw. per cub. ft. capacity was sufficient for the oven. The disposition of the elements, and other problems, were then considered. The Paper provoked a good discussion.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

Both the National Telephone Co. and the Post Office are appealing against the award of the Railway and Canal Commissioners as to the value of the former's undertaking taken over by the Post Office. The Post Office are appealing against the cost of obtaining subscribers' agreements and the cost of raising capital being allowed. The National Co. are appealing against the whole award, and in particular against the method adopted in the award of calculating depreciation. Tuesday, April 15th, has been fixed for the hearing of the appeal.

The first statistical report on the commercial telegraph interests of Canada has just been issued. According to the *Electrical News* (Toronto) the pole mileage for the year ending June 30th, 1912, was 40,785, and the total length of wire 167,939. These figures are made up as follows: Nova Scotia, 2,828 and 9,878; New Brunswick, 1,867 and 8,376; Prince Edward Island, 14 and 14; Quebec, 7,515 and 24,249; Saskatchewan, 5,382 and 21,257; Alberta, 2,895 and 14,491; British Columbia, 3,467 and 10,571; Yukon, 2,498 and 2,713. The total number of employees is given as 4,828, and 9,252,540 telegrams and 768,559 cablegrams were sent. It appears that the first telegraph was constructed in Canada in 1846, between Toronto and Niagara, one year later than the first commercial line in the United States.

The telephone statistics for the same period show that 212,732 common battery telephones and 158,152 magneto telephones were in use. The increases during the year were 37,738 common battery and 30,387 magneto. The wire mileage is given as: galvanised, 271,911; copper, 20,096; overhead cable, 232,893; underground cable, 364,875; submarine cable, 1,015. There was one telephone for every 19.3 of the total population and one telephone for every 2.3 miles of wire. The number of employees was 12,783, compared with 10,425 for the previous year.

The Postmaster-General has stated that no license has been granted Marconi's Wireless Telegraph Co. for the Transatlantic station which they are now building in North Wales, and that the Company is proceeding at its own risk in the matter. The question of granting a license for this station will be considered when the House of Commons Committee now sitting has presented its final report.

It is stated that a scheme by which communication might be maintained by wireless between Aberdeen and Dundee in the event of a breakdown of the telegraph wires has been submitted to the Postmaster-General.

The Select Committee of the House of Commons which last session inquired into the Imperial wireless scheme has been re-appointed and will shortly resume its meetings.

The Atlantic Companies, on the 11th inst., stated that the new regulations for the acceptance of traffic to Mexico were as follows:—Communication is cut off with Coahuila, Durango, Chihuahua, Morelos, Sonora, and Caxaca, as well as with Puerto Morelos and Tepepand Galeana. Telegrams to places in the interior are only accepted at sender's risk and with delay.—Code and cipher are accepted for all places.—The line between Bagdad and Bassorah was down on 11th inst., and the cable between Madagascar and Réunion and between Réunion and Mauritius failed on the same day. The latter cable was repaired on the 15th inst., thus putting an end to the risk senders had to incur while the cables were down.—The Bagdad-Bassorah line was working again on the 12th inst., and the Zante-Crete cable was restored.—The Greek Administration opened an office at Janina on the 13th inst., and telegrams for this place will be routed *via* Corfu, and are subject to delay.—On the 15th inst. lines were down to Morelos, Guerrero, Coahuila, Durango, and Chihuahua in Mexico.

**Royal Institution.**—Among the lecture arrangements after Easter is a Friday evening discourse on May 23rd, by Prof. Silvanus P. Thompson, on "The Secret of the Permanent Magnet."

## "ELECTRICAL ENGINEERING" PATENT RECORD

*(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)*

### Specifications Published March 13, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

4,090/12. **Heating Element for Cooking Utensils.** W. F. PERRY. In combination with a flat or conical top plate is a recessed underplate coated on its upper surface with insulating enamel. An asbestos-covered resistance is placed in this recess. Heat is conducted from the under to the top plate by an annular flange. The interstices of the element are filled with cement. A central bolt secures the element to the base of the utensil. Two figures.

6,275/12. **Telegraph Relays.** S. G. BROWN. To avoid the bad effects of slowly varying currents on the working of relays, such as those described in specifications Nos. 19,779/11 and 20,451/11 (ELECTRICAL ENGINEERING, Vol. VIII., pp. 550 and 564). There is interposed between the first relay and the sending-on relay an apparatus to shut off steady or slowly varying currents from the second relay. To prevent a weakening of signals of long duration, provision is made in the local circuit of the sending-on relay to compensate for this. A condenser or an "air-gap" transformer may be used for this purpose, and the compensation may consist of a coil in the local circuit and a combination of resistance and inductance, or resistance and capacity. Two figures.

6,864/12. **Radiator.** JAMES SLATER & Co. and C. R. ALLENSBY. To prevent currents of cold air entering rooms through open spaces between window frames, &c. An angle base plate with suitable feet is erected with its horizontal flange uppermost. This flange is slotted, and carries the heater elements, which are protected by a wire guard. The other flange acts as a baffle for preventing air passing between the horizontal flange and the under frame into the room. Five figures.

10,545/12. **Protective Gear.** B.T.-H. and E. B. WEDMORE. To obtain discriminative action of relays controlling a distribution network, impedance is inserted, not between distributing centres, but at the distributing point between the two switches.

11,394/12. **Manufacture of Aluminium Carbides.** S. PEACOCK. The higher carbides of aluminium are obtained by feeding a finely divided mixture of alumina and carbon into a combined arc and resistance furnace, and at the same time maintaining a pressure below that of the atmosphere and a temperature low enough to prevent the dissociation of the higher carbides. One figure.

21,831/12. **Automatically Cutting Out Faulty Cables.** BERGMANN. At the ends of each section of the conductor artificial neutral points are formed. They are connected by an auxiliary insulated conductor, which is connected to the main conductors through relays. The difference in P.D. between the main and auxiliary conductors produced by a fault causes the relays to operate disconnecting switches. Five figures.

27,969/12. **Telephone Receivers.** J. SCHISSLER. To prevent cracking of the diaphragms due to atmospheric disturbances and condenser discharges, a non-magnetic diaphragm is connected through bell-crank levers to a system of magnets in the longitudinal axis. The magnets also provide the necessary damping. Three figures.

### Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad. Summaries of some of the more important of these patents will appear in our next issue.

**Arc Lamps:** B.T.-H. (*G.E.C., U.S.A.*) [Electrodes] 15,483/12; G. SCHANZENBACH & Co., Ges. [Suspension] 22,549/12.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** MARTIN, JACKSON, and CAMPBELL [Controlling guns, steering-gear, bridges, capstans, &c.] 1,901/12; BACON and SHEPHERD [Leading electric power into revolving structures] 5,336/12; B.T.-H. and WEDMORE [Protective gear for distributing systems] 8,569/12; BETTELL and MANNERS-SMITH [Stage lighting reflectors and screens] 14,722/12.

**Dynamos, Motors, and Transformers:** BROWN, BOVERI [A.C. generators] 4,460/12; PRICE [Dynamos] 5,981/12; SIEMENS SCHUCKERT [Transformers] 15,647/12; GOLODEIZ [Rectifiers] 18,741/12; SIEMENS SCHUCKERT [Polyphase A.C. commutator motors] 21,471/12; BREDDEN and MOORE [Dynamos] 25,556/12.

**Electrometallurgy and Electrochemistry:** SHELMEIDINE [Milk sterilisation] 17,554/11; BALLY [Retort furnaces] 16,041/12; CHAUMAT [Manufacture of chrome-alum by electrolysis] 1,636/13.

**Ignition:** WILKS, 3,404/12; BOSCH [Driving mechanism of oscillating armature magnetos] 23,046/12; MASCOV [Reducing duration of sparks from magneto] 27,094/12.

**Switchgear, Fuses, and Fittings:** LONGBOTTOM and FARRAR [Conduits] 4,426/12; HAWKES and COCKERILL [Lamps for illuminating music] 4,816/12; PEYTON and BOND [Electroliers] 5,467/12; INSTAN and HOLT [Securing shades on lamp-holders] 9,302/12; BIJUR [Circuit interrupters] 9,426/12; DAUM [Refillable fuse] 21,240/12; VOIGT & HAEFFNER [Cut-outs] 23,514/12.

**Telephony and Telegraphy:** MELLINGER [Telephone systems] 4,179/12; GOTT [Working submarine cables] 10,534/12.

**Miscellaneous:** SCHISSLER [Reproducing undulating currents] 4,407/12; TURNBULL [Windmills] 11,240/12; GAIFFE [Light baths] 17,778/12; CAMPICHE [Striking gear] 17,779/12; GRAHAM [Water-tight bells] 19,587/12; WALKER [Clock mechanism] 20,366/12; KELVIN & JAMES WHITE and BOTTOMLEY [Compasses] 26,358/12; WEHRLIN [Protecting storage batteries from flooding by sea-water] 28,520/12.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Dynamos and Motors:** SIEMENS SCHUCKERT [Field Magnets] 3,627/13.

**Switchgear, Fittings, &c.:** CHUBB [Terminals for aluminium conductors] 2,146/13.

**Telephony and Telegraphy:** SIGNAL GES. [Submarine] 3,853/13.

**Miscellaneous:** SMITH [Electrocuting animals] 2,199/13; HELM [Coil winding] 4,091/13.

The following Amended Specification may now be obtained.

**Incandescent Lamps:** A. C. HYDE, 6,487/12.

### Application for Restoration of Lapsed Patent

15,801/01. **Pull Chain Switch Lamp Holders.** H. HUBBELL. This patent expired on August 6th, 1912, owing to non-payment of the renewal fee. Application for restoration is now made under Section 20.

### Opposition to Grant of Patent

28,260/12. **Moving Targets.** J. B. LE MAITRE. This specification deals with an electro-magnetic clutch and several details of the mechanism for controlling the motion of the screen and the picture projector for the purpose of viewing the shot hole. The relay for stopping the target when a shot is fired is that described in specifications Nos. 25,851/10 and 27,521/11.

### Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

6,229 of March 22nd, 1899. **Column Printing Telegraphs.** F. H. W. HIGGINS. The transmitter consists of a magneto supplying A.C. to a Wheatstone type transmitter. The receiver consists of a polarised relay energised by the signalling currents. The currents also pass through an unpolarised relay. When the current is interrupted by the arrival of the type wheel at the letter to be printed the second armature leaves its magnet and operates the escapement, which allows a spring or weight to impress the letter on the paper. The type wheel is advanced along the column by a fast motion screw.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Arc Lamps:** A. BLONDEL [Leading gas from mineralised electrodes from the arc] 24,562/05.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** B.T.-H. and J. E. WOODBRIDGE [Composite cable for A.C. distribution to railways whereby the return pressure drop is reduced] 27,302/06.

**Electrochemistry:** G. BREWER (*E. R. Taylor*) [Furnace for production of carbon disulphide] 26,130/07.

**Incandescent Lamps:** WESTINGHOUSE METAL FILAMENT LAMP Co. [Production of tungsten dioxide] 18,922/07; [Connecting metal filaments to leading-in wires by alloys] 18,923/07; F. LE TALL (*A. Lederer*) [Hollow tungsten filaments] 26,179/07.

**Instruments and Meters:** W. HAMILTON and FERRANTI's [Pre-payment] 25,966a/05; W. MEYERLING [Oscillating armature D.C. meter] 26,031/07.

**Switchgear:** G. FINZI [Switch for adjustable pressure transformers to avoid breaking circuit during the change] 26,051/05.

**Telephony and Telegraphy:** I. KITSEE [Submarine telegraphy: impulses of equal duration but of alternate sign] 26,043/04; A. F. PETCH, F. DUNCAN, and O. C. F. KING [Harmonic electro-magnetic order telegraphs] 26,195/07.

**Traction:** E. TYER [Automatic tablet-changing mechanism at passing places on single-line railways] 23,897/01; SIEMENS BROS. & Co. and L. M. G. FERREIRA [Point detector] 26,983/06; [Motor-operated points] 26,984/06.

**Miscellaneous:** S. LAKE [Submarines] 25,924/99; A. J. B. LÉCÉ [Moving targets: aim recording] 26,215/05.

## LOCAL NOTES

**Barrow-in-Furness: Strike of Employees.**—Although most of the Corporation's workmen are out on strike, the employees of the Electricity Department, with the exception of two or three casual labourers, have remained loyal, and as a result there has been no interference with the electricity supply. Fortunately most of the main thoroughfares are lighted by electricity, otherwise a considerable public inconvenience would have been caused owing to the men of the Gas Department being out. As a matter of fact, a number of the staff of the Electricity Department have been assisting in the Gas Department.

**Belfast: Large Power Demand.**—Messrs. Workman, Clark and Co. have applied to the Corporation for a supply of electrical energy which may amount to 1,000,000 units per annum for one yard alone, together with a similar demand for the firm's south yard. Negotiations are being conducted.

**Bingley: Bulk Supply.**—When the agreement referred to in our issue of Feb. 27th for the supply of electrical energy in bulk to this district by Keighley came before the latter Council last week, complaints were made that the price was too low, having regard to the charges now in force in Keighley itself. It was contended that the price was lower than that at which the Tramways Department is being supplied at the present time, and eventually an amendment to refer the agreement back was carried. The terms are for a supply of three-phase current at 6,600 volts 50 periods, the Bingley Council to pay a fixed annual charge of £400 if the consumption does not exceed 300,000 units; £500 if it exceeds 300,000 but does not exceed 400,000; and £600 if it exceeds 400,000, in addition in each case to 3d. per unit, registered by a meter fixed at the Bingley end of the high-tension cable.

**Bispham: Electrical Extensions.**—The Local Ratepayers' Association have protested against the proposed expenditure of £8,000 for electric lighting purposes in view of a possibility of the district being absorbed into Blackpool.

**Dundee: Arc Lighting.**—The Harbour Board have installed arc lighting at the Camperdown Docks.

**Edinburgh: Lighting of Redford.**—A dispute has arisen between the Colinton Tramway Co. and the Corporation on account of the desire of the former to resell for lighting purposes electric current taken from the Corporation for the tramway undertaking. The Corporation claim the right to supply in Redford themselves.

**Glasgow: Electric Motor Van.**—The Electricity Committee have purchased an electrically-driven motor van for the purpose of conveying breakdown squads. It is equipped with a battery of thirty cells and is said to be able to run a distance of forty miles on a single charge.

**Hove: Purchase of Electric Supply Co.**—Arrangements have been made between the Corporation and the Company for the latter to carry on their undertaking as usual, pending the passing of the Corporation's Bill to purchase. In the event of this latter passing, the purchase money will become due on December 8th.

**Lowestoft: Lighting and Power Tariff.**—The charge for private lighting is to be increased to 5d. per unit, and that for power will in future be 2d. per unit up to 2,000 units per quarter, and 1½d. per unit for all consumption above. The charge for hire for outside shop incandescent lighting has been increased to 2s. per quarter per fitting.

**Lytham: Electric Lighting.**—A Board of Trade inquiry was held here last week into applications by the Lytham Council and the St. Anne's-on-Sea Council for electric lighting orders.

**Pembroke: Electric Lighting Tariff.**—Owing to the decrease in the profits last year of £1,000 in consequence of the price of coal, it has been decided to increase the present charges for supply by 5 per cent. all round. An amended scale for the use of energy for industrial purposes is under consideration.

**Sunderland: Obsolete Plant.**—In connection with the sale of the superseded steam plant at Dunning Street, the Corporation has undertaken to pay off the outstanding debt within a period of five years from April 1st. It is estimated that in addition to the amount received from the sale of the plant, a sum of £520 yearly for five years will be necessary.

**Waterford: Electric Supply.**—For a long time there have been protests against the inaction of the Corporation with regard to the question of electric supply, there being obviously a demand in the town. In the circumstances it is not surprising that the Gas Company have now decided to

go into the question, and, in fact, Mr. C. H. Wordingham has visited Waterford on their behalf and has made a report.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

## Generating Stations, Sub-Stations, Mains, &amp;c.

**Ayr.**—The Corporation are being urged to extend their mains to Prestwick.

**Blackpool.**—High and low-tension cables, transformer switch pillars and accessories. Borough Electrical Engineer.

**Burton-on-Trent.**—Mains are to be extended to Stretton.

**Canada.**—One 200-kw. and one 400-kw. A.C. turbo-generating sets are required by the Swift Current Council, Saskatchewan. March 31st. This information is only of use to those firms whose agents can be instructed by cable.

**Hereford.**—A Local Government Board inquiry was held last week concerning an application for a loan by the Corporation of £1,600 for the installation of electric pumping machinery at the Waterworks.

**Holmfirth.**—The Council have decided to take a supply in bulk from the Yorkshire Electric Power Co., and a consulting engineer is to be engaged.

**New Zealand.**—An expenditure of £12,000 is contemplated by the Whangarei Municipality.

**Shanghai.**—Extra high and low tension three-phase switch-gear for sub-stations. Preece, Cardew & Snell, 8 Queen Anne's Gate, Westminster. April 3rd.

**Stalybridge.**—4,500 yards extra high tension three-core lead-covered paper-insulated cable. Chief Engineer, Electricity Board.

## Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

**Cardiff.**—Block of offices in Mount Stuart Square. Architect, Henry Budgen, 96 St. Mary Street.

**Dublin.**—Additions to Military Hospital. War Office, Whitehall.

**Edinburgh.**—Royal (Dick) Veterinary College. Architect, D. M'Arthy, 25 Frederick Street.

**London:** L.C.C.—620 points at Avery Hill Hostels, Eltham. Clerk. April 2nd. (See an advertisement on another page.)

**Lewisham.**—One of the staff engineers of the South Metropolitan Electric Light and Power Co. has been engaged as consulting engineer for the electric lighting of the infirmary and workhouse.

**St. George's-in-the-East.**—Gymnasium and swimming bath at schools, Green Street, Upton Park. Guardians' Offices, Raine Street, Old Gravel Lane, E.C.

**Manchester.**—Mr. H. C. Crews, of Clarence Chambers, has been appointed consulting electrical engineer to Denstone College, which is to be fitted for electric lighting.

School, Old Hall Drive, Gorton. Education Offices.

**Paisley.**—Extensions to Art Gallery.

**Sal.**—Higher elementary school. Architects, F. Hewitt and Son, 33 Brazenose Street.

## Miscellaneous

**Bolton.**—A supply of general stores for Electricity Department. Borough Electrical Engineer, March 27th.

**Brazil.**—Two wireless stations are to be erected at Fortaleza and Porto Murinho.

**Canada.**—Large quantities of electrical supplies are required by the City Commissioners of Regina, Saskatchewan. March 29th. This information is only of use to firms whose agents can be instructed by cable.

**Chile.**—Fresh tenders are to be invited for the electrification of the 117-mile section of line from Valparaiso to Santiago, and for the branch line from Las Vegas to Los Andes, a distance of twenty-eight miles.

## THE RECORD ELECTRICAL Co., Ltd.

LONDON OFFICE:  
CAXTON HOUSE,

Write for Prices & Particulars.

**London: Islington.**—A twelve months' supply of electrical fittings and sundries for the Guardians. Clerk, St. John's Road, Upper Holloway.

**Russia.**—According to the *Board of Trade Journal*, various schemes of electric railways for the Warsaw district are under consideration by the Russian Committee of New Railways.

**Taunton.**—Electrically-driven boiler feed pump. Borough Electrical Engineer.

**Wigan.**—Electrical stores for Electricity and Tramways Departments. Borough Electrical Engineer. March 31st. (See an advertisement on another page.)

## TENDERS RECEIVED AND ACCEPTED

**Ashton-under-Lyne.**—The tender of Switchgear and Cowans, Ltd., has been accepted for high-tension switchgear.

**Bridlington.**—Fourteen tenders have been received for a 600-kw. generating set, and it is recommended that a Willans disc-and-drum turbine coupled to tandem D.C. Brown Boveri generators shall be purchased at a cost of £2,867, subject to the necessary sanction by the Local Government Board.

**London: Hammersmith.**—The tender of Messrs. Chamberlain and Hookham is recommended for a supply of prepayment meters at £2 6s. each, less 2½ per cent., for 3, 5, and 10-ampere sizes for 110 and 220 volts. There were ten tenders in all, ranging from a total for the three sizes of £6 17s. to £8.

The Electrical Engineering and Equipment Co. have received an order for arc-lamp carbons at £137 10s., less 2½ per cent. There were nine tenders, ranging from the accepted one to £206 14s.

**Metropolitan Asylums Board.**—An order for a twelve months' supply of "Wotan" drawn-wire and carbon filament lamps has been placed with Messrs. Siemens Bros. Dynamo Works.

**Whitehaven.**—The Bastian Meter Co. have received an order for a supply of 5-ampere meters.

## APPOINTMENTS AND PERSONAL NOTES

The Rt. Hon. Viscount Chilston has been elected president of the Tramways and Light Railways Association. Viscount Chilston, as the Rt. Hon. A. Akers Douglas, was Home Secretary for 1902-6, in addition to having been previously Parliamentary Secretary to the Treasury and First Commissioner of Works.

Mr. Arthur Wright has been retained by the Edison Electric Illuminating Co. of Boston as general adviser. According to the *Electrical World* (New York) Mr. Wright will spend a considerable time in Boston in the early spring.

Dr. J. Erskine-Murray has joined the firm of Clark, Forde and Taylor (H. A. Taylor, A. L. Dearlove and R. M. Sayers), Consulting Engineers to the Pacific Cable Board and many other cable owners. The style of the firm after March 25th will be Clark, Forde, Taylor and Erskine-Murray, 4 Great Winchester Street, E.C. By this combination the firm will be in a position to advise upon, and act as consultants in, all branches of telegraphic engineering.

The salary of Mr. E. H. Wright, Borough Electrical Engineer at Rhyl, has been increased to £200 per annum.

Mr. G. A. Bruce, Borough Electrical Engineer and Tramways Manager at Lowestoft, has resigned.

Fitters, turners, and instrument-makers are required in the Royal Navy. (See an advertisement on another page.)

An electric mechanic is required for the East African Postal Telegraph Department. (See an advertisement on another page.)

**Electrical Exhibition at Glasgow.**—The Corporation has decided to hold an Electrical Exhibition incorporating engineering and machinery from October 23rd to November 15th next. The scope will embrace lighting, heating, and power, and a special section will be devoted to appliances for domestic purposes. There will also be sections illustrating applications of electricity to light railways, mining, textile, and other industries.

**Manchester Electro-Harmonic Society.**—The last concert of the season is to be held in the Marble Hall, Albion Hotel, Piccadilly, Manchester, on March 28th.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. George Smith & Son, 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night was £69 to £69 10s. (Last week the same.)

**Companies Struck off Register.**—The names of the following companies have been struck off the register of joint stock companies: Dynamo Electric Car Transmission Syndicate; Electrical Fittings Co.; Electrocarb Development Co.; London Electrocarb Co.; Norfolk Electrical Co.

**Dissolution of Partnership.**—J. H. Pybus and T. Pybus, Electrical Engineers, 29 Brown Street, Manchester, have dissolved partnership. Debts by J. H. Pybus.

**Bankruptcy.**—J. Mitchell and F. Mitchell, trading as F. Mitchell and Co., Electrical Engineers, 97 Stockport Road, Ardwick, Manchester, have filed their petition. The public examination will be on April 23rd at the Court House, Quay Street, Manchester.

**Change of Address.**—Messrs. G. Harland Bowden and Co. have moved from the City to 1 Victoria Street, Westminster, S.W. Telegraphic address, Harbowdeco, Vic., London. Telephone number, Regent 1009.

## COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**City of London Electric Lighting Co.**—The Directors' Report for 1912 calls attention to the fact that on August 18th, 1914, the City Corporation may give notice of its desire to purchase the Company's undertaking in the City of London, but no indication is given as to whether the directors have any information regarding the intentions of the City Corporation.

**Newcastle-on-Tyne Electric Supply Co.**—There was a net profit of £90,518 last year, and after transferring £15,000 to depreciation, a 5 per cent. dividend is paid on the ordinary shares, carrying forward £6,768.

**County of Durham Electrical Power Distributing Co.**—The net profit for the past year was £20,363. The preference dividend is met, but no dividend is paid on the ordinary shares.

**Chelsea Electric Supply Co.**—At the meeting last week it was mentioned that an agreement has been entered into with the Central Electric Supply Co. for a supply in bulk to the most northern of the Chelsea Company's sub-stations. This assures the Chelsea Co. of a standby for an important part of their area, and also supplies a point which is the least economical for them to supply from their own generating station. Another departure is the decision to order Diesel engine plant for the generation of a considerable portion of the Company's own current.

**Clyde Valley Electrical Power Co.**—Subscriptions are being invited for £300,000 6 per cent. cumulative preference shares.

## NEW COMPANIES

**C. A. PARSONS & CO.** Heaton Works, Heaton, Newcastle-on-Tyne.—Capital, £450,000 in £100 shares. The Hon. Sir Charles A. Parsons, K.C.B., and six others will form the Board.

**STRODE & CO.**, 48 Osnaburgh Street, N.W.—Capital, £20,000. To take over the existing business of electrical and general engineers.

**MOSCOW ELECTRICITY CO.**—This company has been formed with a capital of 12,000,000 francs. The promotion is being financed by Belgian capitalists.

**Insulated Aluminium Cables.**—We are informed that the Paris Omnibus Co. have just placed an important contract for aluminium armoured cables for tramway feeder networks. The cables will have cross-sections up to 1,000mm<sup>2</sup>. (1.55 sq. ins.), and are for a pressure of 500 volts. The order comprises some 300 tons of metal, and is expected to show an economy of 8 to 10 per cent. as compared with the cost of copper cables. Including cables already installed of a net weight in aluminium of about 300 tons, this Company's system now has in service or on order insulated cables employing a total of 600 tons of aluminium.

## SUMMARY

HAND and automatic starting and speed control of alternating-current motors was the subject of a paper by Mr. J. T. Mould, read before the Association of Engineers-in-Charge recently. Some interesting applications of automatic gear were given. (Page 170.)

An example of the way in which electrical working can be of use to contractors for constructional work is presented by the extensions now being completed at the Glenquey reservoir in Perthshire. (Page 171.)

SOME points in connection with the uses of electric power on warships were dealt with in a paper read by Mr. A. P. Hyne, read before the Newcastle Local Section of the Institution of Electrical Engineers. (Page 172.)

A PAPER by Mr. Alexander Siemens at the recent meeting of the Institute of Metals traced the progress of metal filament lamp manufacture. (Page 173.)

THE results of some researches regarding the properties of ebonite have been published, with a proposed specification of suitable tests for ensuring its high quality. (Page 173.)

THE conversion of a brickmaking works to electric drive is referred to in a short article. (Page 174.)

THE value of good illumination was dealt with in a recent Paper by Mr. Leon Gaster before the Royal Society of Arts. In the discussion the history of the lighting of the Society's building was given. (Page 174.)

A NEW design of combined switch fuse and plug is described and illustrated. (Page 174.)

THE question of obtaining variable D.C. voltage from rotary-converters without special boosting arrangements is discussed in our "Questions and Answers" columns. (Page 175.)

AMONG the specifications published by the Patent Office on Thursday last was one for submarine telegraphy by reverse currents by J. Gott. Patents in connection with A.C. commutator motors have also been taken out by Brown, Boveri et Cie and Siemens Schuckertwerke Ges. There are a number of patents expiring during the current week after a life of fourteen years. These include one for improvements in H-type cells by R. O. A. Heinrich, and one for induction coils for wireless by G. Marconi and the Marconi Co. (Page 176.)

At a recent meeting of the Scottish Local Section of the Institution of Electrical Engineers in Edinburgh Mr. W. B. Hird initiated a discussion on electric propulsion of ships by giving a lecture on the experimental "Electric Arc." (Page 177.)

At a recent meeting of the Western Local Section of the Institution of Electrical Engineers, in Bristol, Professor D. Robertson gave an exhibition of some applications of the stroboscope. (Page 177.)

A CORRESPONDENT asks a question about the various regulations prescribed by different bodies for the installation of electrical apparatus. (Page 177.)

A new plug for fixing wiring is described. (Page 178.)

LONDON local authorities are resisting a proposal in the Metropolitan Electric Tramways (Railless Traction) Bill to give the Board of Trade power to sanction additional trolley-omnibus routes. "Pay-as-you-enter" cars are now in use in Leicester. (Page 178.)

THE Australian Government has granted the Marconi Co. permission to inspect its wireless plant in connection with the patent action which is pending. The circumstances of how the Attorney-General purchased 10,000 shares of the American Marconi Co. are being explained to the House of Commons Committee. (Page 179.)

STREET electric lighting is to be extended in Belfast.—The rateable value system of charging has been adopted at Gloucester.—The Electricity Committees at Dublin and Hornsey are averse from handing over large sums from profits to relief of rates. (Page 179.)

EXTRA high-tension switchgear is required at Dundee; cable at Peterborough; additional feeder panel at Grimsby; electrical installations are required by the Waterford Guardians and for the Queen Street Wharf, Auckland, N.Z.—The Bloemfontein Council has decided to instal a trolley-omnibus system. (Page 179.)

A DIVIDEND of 5 per cent. and a bonus of  $2\frac{1}{2}$  per cent. is declared on the ordinary shares of Messrs. W. T. Glover and Co.—The year's working of the Automatic Telephone Co. has been so successful that the British Insulated and Helsby Cables, Ltd., will not be called upon, under their guarantee, to provide a sum for the preference dividend.—The last year's working of the South Wales Electrical Power Distribution Co., the British L.M. Ericsson Manufacturing Co., and the British Aluminium Co. has also been satisfactory. (Page 180.)

### ARRANGEMENTS FOR THE WEEK

#### FRIDAY, MARCH 28TH.

*Manchester Electro Harmonic Society.*

7.30 p.m. Concert, Albion Hotel, Piccadilly.

#### SATURDAY, MARCH 29TH.

*Association of Mining Electrical Engineers.*

5.30 p.m. Warwick and S. Staffs Branch. At Imperial Hotel, Temple Street, Birmingham. "Cable Jointing and Junction Boxes, &c.," by C. Jones.

5 p.m. S. Wales Branch, Eastern Section. At Carlton Café, Cardiff. "The Speed-Control of Three-Phase Motors," by S. Simons.

7.30 p.m. Western Section. At Swansea Grammar School. "Turbine Engines: their Construction, Installation, and Maintenance," by A. L. Ohlson.

#### MONDAY, MARCH 31ST.

*Institution of Electrical Engineers: Newcastle Section.*

7.30 p.m. At Armstrong College. "Telephonic Development," by J. R. Andrews.

#### TUESDAY, APRIL 1ST.

*Institution of Electrical Engineers: Manchester Section.*

7.30 p.m. At the University. "Self-Synchronising Machines," by Dr. E. Rosenberg.

#### WEDNESDAY, APRIL 2ND.

*"DYNAMICABLES."*

7.30 p.m. Anniversary Dinner at Trocadero.

#### FRIDAY, APRIL 4TH.

*Electro Harmonic Society.*

8 p.m. Smoking Concert at Holborn Restaurant.

*Faraday Society.*

8 p.m. Joint meeting with Manchester Section of Society of Chemical Industry to discuss "The Corrosion of Iron and Steel."

### The London Electrical Engineers.

(To-Day) THURSDAY, MARCH 27TH. C. Company.—Recruit Training, 7 to 10 p.m.; Company Training, 7 to 10 p.m.

FRIDAY, MARCH 28TH. D. Company.—Company Training, 7 to 10 p.m.

SATURDAY, MARCH 29TH. Headquarters open from 10 a.m. till 12 noon.

MONDAY, MARCH 31ST. A. Company.—Recruit and Company Training, 7 to 10 p.m.

TUESDAY, APRIL 1ST. B. Company.—Company Training, 7 to 10 p.m.

THURSDAY, APRIL 3RD. C. Company.—Recruit and Company Training, 7 to 10 p.m.

FRIDAY, APRIL 4TH. D. Company.—Company Training, 7 to 10 p.m.

SATURDAY, APRIL 5TH. Headquarters open from 10 a.m. till noon.

**The Strength of Metal Filaments.**—The General Electric Co. inform us of yet another case where the ability of Osram lamps to withstand rough treatment is proved. At Blackpool the other day a 16-c.p., 250-volt Osram lamp in its carton had been thrown away by mistake, and was only discovered when on the point of being tipped into the destructor. The lamp was found to be intact, and is now in use.

### CONTROL OF A.C. MOTORS

THE control of alternating-current motors was the title of a recent Paper read before the Association of Engineers-in-Charge by Mr. J. T. Mould (Adams Manufacturing Co., Ltd.). After briefly reviewing the characteristics of the many types of A.C. motors, the author describes the usual methods of speed control. The star-delta method of starting is only applicable to motors starting light or driving loads which develop after partial acceleration, as, for example, fans and centrifugal pumps. The switches for this operation should be of the drum type, since the contacts are independent and may therefore be self-aligning and self-adjusting. The rotary movement should be in the same direction from the "off" position, right through the "star" to the "delta" position. To meet the objection to this method that the starting torque cannot be varied, an auto-transformer may be used. For motors up to, say, 20 h.p., taps are usually provided to give about 50, 65, and 80 per cent. of line voltage, with respective line currents about equal to 25, 42, and 65 per cent. of what would be taken by switching straight on to the mains. For larger motors it is common to provide taps giving about 40, 58, 70, and 85 per cent. of line voltage with respective line currents of about 16, 34, 50, and 72 per cent. of what would be taken if no auto-transformer were used. The only method of starting slip-ring motors is to gradually take out resistance from the rotor circuit. It is common to limit the current on the first step to about 150 per cent. of its normal full-load value, and except for large motors to allow a 15-seconds starting rating. For motors larger than 100 h.p. at 200 volts, or 200 h.p. at 500 volts, a multiple lever toggle-joint starter is recommended in preference to a sliding-contact starter.

Automatic no-volt release, although more popular than formerly, is not so often fitted to A.C. as to D.C. switchgear. Although not essential to the safety of the motors, it protects the line against violent disturbances. A series overload trip applied to two phases of a three-phase motor prevents it running single-phase.

Automatic control is advocated for air compressors, which convenience demands should be started and stopped by variation of air pressure; centrifugal and ram pumps, which require to be controlled by variation of water level; hydraulic pumps, to be started and stopped by the rise and fall of an accumulator; fire pumps, calling for control from numerous and remote positions; lifts and hoists, swing and rolling bridges, conveyors, transporter bridges, and all kinds of automatic machinery. The author then referred to some examples of this type of gear made by the Adams Manufacturing Co., Ltd. Many of these have already been described in ELECTRICAL ENGINEERING. An interesting auto-transformer starter for large squirrel-cage motors consists of magnetically-operated clapper switches mounted on a panel and so connected that the closing of the master switch causes two of them to close and connect the auto-transformers to the lines and the motors to suitable taps. After a sufficient pause these first switches open, and the remaining ones close, thereby entirely disconnecting the auto-transformers and connecting the motor terminals to the line. The pause in starting is secured by series relays, and its duration depends entirely upon the starting performance of the motor. If the motor accelerates quickly at the low voltage the pause is a short one, but if it accelerates slowly a longer period elapses before the auto-transformers are cut out. A case is also quoted of the system being applied to cascade motors fixed in the middle of a rotating machine where the controller has to be some distance from the motor. In another case, by the use of series relays controlling clapper switches, the controller of a rolling mill motor automatically increases the slip by introducing resistance in the rotor circuit on each recurrence of the peak, and cuts it out when the peak is passed.

**Association of Electrical Station Engineers.**—A Liverpool branch of this Association has been formed. We gave particulars of the objects of the Association on p. 90 of our issue of February 13th. It is stated that the membership is now nearly 5,000.

**Mercury Vapour Apparatus in U.S.**—The patent litigation which has been pending for many years between the Cooper Hewitt Electric, the General Electric, and the Westinghouse Electric & Manufacturing Companies, of America, has, says the *Electrical World* (New York), been settled by an exchange of licenses under the patents of P. Cooper Hewitt, E. Weintraub, P. H. Thomas, C. P. Steinmetz, and others. Both the Westinghouse and General Electric Companies have been licensed to manufacture rectifiers, while the General Electric and the Cooper Hewitt Companies have exchanged licenses for mercury vapour lamps.

## ELECTRICITY IN CONSTRUCTION WORK

THE supply of labour is of vital importance in the carrying out of construction work and will often decide whether a contract may prove profitable to the contractor or not, and whether he will be enabled to adhere to the specified time of completion. In many cases mechanical power has advantageously superseded manual labour to a considerable extent by the use of comparatively small and inefficient steam units, but as a general rule the application of electricity obtained from a central source of power in the neighbourhood, or by the equipment of a power station to suit requirements, is preferable both for convenient and economical working. No better results in this connection have been obtained than with the working of pumps, results, indeed, unattained by any other method of transmission because of the steady load on the motor. A further recommendation for this duty is the mobility of the pumps and motors, as, the energy being transmitted by cables, it is obvious that very little work is involved in removing the pumps to other areas as found necessary.

A recent instance of the use of electricity in contracting is to be found in the work now being completed at Glenquey Reservoir in Perthshire. This undertaking was constructed three or four years since to provide storage for the water-supply to the Southern District of Fife and particularly in anticipation of the expected increased demand created by the naval base at Rosyth. About eighteen months ago it was found necessary to extend the puddle trench of the retaining

is accommodated at the end of the power-house building which is driven by belting from the engine flywheel. Electric energy is transmitted to the bank workings by overhead bare conductors supported on insulators fixed to poles and entering buildings through porcelain tubes. Separate cables radiate from distributing boards in store cabin adjoining excavations for the supply of pump, crane and lighting.

FIG. 2.—GENERAL PLAN OF INSTALLATION.

As the growth of water was uncertain one pump was supplied in the first instance, which has proved sufficient to deal with the amount of water in the trench. The centrifugal pump and motor combination, manufactured by Weise and Monski, will deliver 300 gallons of water per minute against a total varying head of from 50 to 190 ft. The pump delivery to 6 in.-rising main pipe column, fitted with retaining valve, is throttled at the sluice valve as required to keep the quantity of water normal during sinking operations at reduced head. The 25-h.p. motor running at 1,700 r.p.m. is of shunt wound protected type for 250/300 volts and suitable to drive the pump at full load without undue heating. Although the pump was used intermittently, spare impeller parts and a motor armature were available to ensure continuity of service, but it is gratifying to know that neither have so far been necessary.

A three-ton electric derrick crane by Butters Bros., lifting at the rate of 80 to 120 ft. per minute, is fitted with a 60-ft. steel lattice jib, made in two portions for convenient delivery and erection. A 12-b.h.p. motor of enclosed reversing type, series wound for 250/300 volts at 700 r.p.m., is fitted to this crane and a tramway-type controller with magnetic blow-out and suitable resistance is mounted alongside. The crane has handled fully 10,000 cub. ft. of earth and rock excavations, besides the necessary timbering, &c.

Aerial conductors are supported on porcelain insulators fixed to cross arms on poles spaced about 20 yards apart, the connections being taken from these conductors to twenty-

FIG. 1.—CONSTRUCTION WORKS, GLENQUEY RESERVOIR.

bank into the hill at the east side with a view to increasing the capacity of the reservoir, which has been planned to provide double storage at any future time by raising the existing bank by 11ft. The contractors, Wilson, Kinmond and Marr, Ltd., of Glasgow, were entrusted with the extension, and on the advice of their consulting engineers, James E. Sayers and Caldwell, of Glasgow (who kindly supplied us with these particulars), decided to provide generating plant in a position accessible for the easy delivery of fuel, the power being supplied to pump, crane, &c., by means of an overhead transmission line. A general view of the works is shown in Fig. 1.

The position of the power house in relation to the work can be seen in Fig. 2, while the plan in Fig 3 shows the general arrangement of generating plant. The gas-engine and suction-producer plant manufactured by the National Gas Engine Co. is capable of giving 75 b.h.p. maximum and 68 b.h.p. constant working load on suction gas of 135 B.Th.U. at 210 r.p.m. The engine is provided with magneto ignition and compressed-air starter. Owing to the continuance of operations night and day during the execution of the contract double producers and scrubbers were provided which are connected together, but, as each is capable of taking three-quarter duty, they are so arranged that either plant could be disconnected to allow the other producer being re-lined with fire-bricks at intervals. A motor-driven fan is fitted to one producer for starting. The dynamo, of 40-kw. capacity, manufactured by the Edison and Swan Co., is compound wound to develop 135 amperes 300 volts at 800 r.p.m. and connected by belting to the engine pulley. A circular saw

FIG. 3.—ARRANGEMENT OF PLANT IN POWER-HOUSE.

four electric lamp fittings fixed to poles by clamping rings underneath. The erection of plant and wiring was carried out by The Harland Engineering Co. and Telford Grier and MacKay.

During the eighteen months the plant has been in operation only 55 tons of Polmaise Anthracite (washed singles), costing £56 12s., including delivery charges, was consumed by the producer plant. The above instance of the application of electricity to contracting work is sufficient to warrant the special consideration of its further development by firms who carry out the erection of large buildings, driving of tunnels, excavating of sewers and all the large public work in connection with the operating of lifts and hoists, concrete mixers, derricks and other contracting appliances.

### ELECTRIC POWER ON WARSHIPS

A PAPER entitled "Some Special Applications of Electricity on Warships," by Mr. A. P. Hyne, was read before the Newcastle Local Section of the Institution of Electrical Engineers on February 10th. The author remarked that the conditions governing the application of electricity to warships were, on the whole, more favourable than in the case of merchant ships. Very little progress had, however, been made in this direction in our own navy, although electrically-worked gun-turrets had been in use in competition with hydraulic gear in other navies for many years.

Many of the disadvantages commonly attributed to electrical working can largely be avoided by designing the turret specially for electrical gear, and designing the electrical equipment with a full consideration of the very exacting nature of the work entailing rapid acceleration of heavy masses, stopping without shock or jar, frequent reversal, wide speed range, and complicated interlocking of the control. Difficulties are also introduced by the long periods of rest. Careful attention must be given to accessibility, simplicity, and suitability of the particular type of apparatus to its particular work. Accessibility is favoured by the use of contactor control, and switches should be standardised as far as possible to minimise replacement parts. Among a number of other points, the author insisted that both motors and switchgear should be robust as regards overload, and electromagnetic switches should be certain in action with considerably reduced voltages. Fuses and double-pole isolating switches must be provided in all control circuits. All contacts should be self-cleaning, and mica and micanite alone should be used for insulation wherever possible. The conditions of operation of winches, lifts, turret-turning gear, hoists, &c., are so varied that the type of motor must be selected to suit each particular case. For boat and coaling winches, lifts, &c., series or compound-wound motors can be used with advantage; but for ammunition hoists and most of the auxiliary gear of gun-turrets the variable speed of such motors under varying loads gives rise to serious difficulties. A shunt winding providing a very strong field is quite the most suitable for such cases.

With regard to cables, the system now adopted by the German and one or two other navies, or using lead-covered

cables protected by a jute braiding and having an armouring of fine steel wires, has, in the author's opinion, much to recommend it, and might with advantage be adopted on our own ships.

The paper then proceeds to a consideration of the requirements of certain special cases. In the central trunk hoist of a heavy gun-turret, the shell and powder cages of the central trunk hoist are frequently independent, the powder cage stopping at the magazine level when descending, and the shell cage continuing to the shell-room flat. With such an arrangement when raising the cages, the shell cage starts first, rapidly accelerates to full speed, then slows down, picks up the powder cage, and the two moving as one accelerate to full speed, and must slow down again just before reaching the top in order not to strike the stops too violently. Conversely, when lowering, the combined cages must slow down just before dropping the powder cage; the shell cage then accelerates to full speed, slowing down again just before reaching the bottom. These conditions are not easy to satisfy, and elaborate interlocking arrangements are necessary. Gun-loading hoist introduce equally arduous conditions, and another difficult case is that of a gun-loading rammer which has to make in less than 12 seconds some three double-strokes of varying length to accommodate the shell, the first two quarter-charges of powder, and the last two quarter-charges of powder. The shell must be pressed well home until there is no doubt that it has been properly rammed. The motor can then be reversed. In the case of the powder strokes, however, the powder must on no account be crushed up by the rammer, which must therefore be stopped automatically at the correct distance. The motor should be shunt-wound, since short-circuiting the armature is almost essential for pulling the motor up quickly at the limits, particularly at the end of the powder stroke. If partial charges are being fired, and the rammer tends to run on after current is cut off, then the powder will be rammed unnecessarily far into the breech. This case is eminently suitable for push-button control. A problem of quite a different nature is that of training, owing to the wide speed-range called for, necessitating a motor of, say, 750 revs. per minute maximum speed being capable of running at less than 3 revs. per minute. Even with the Ward-Leonard system there are difficulties in obtaining so wide a variation satisfactorily, and better results are being obtained with a two-motor system similar to that employed for printing presses.

In conclusion, the author writes:—"Given, however, situations designed for the reception of electrical apparatus, thoroughly reliable switchgear and motors, and the simplicity—from the operator's point of view—of push-button control, electricity should not fear competition from hydraulic power. But although these conditions can now be complied with, the electrical engineer still has the difficult task before him of overcoming the prejudice which exists in certain quarters against the more extended use of electricity for shipwork."

Mr. W. Routledge (Blaydon Iron Works), in the discussion, mentioned some large controllers for steering gear, which were exceedingly complicated but gave little or no trouble simply because all the parts were accessible for cleaning. Mr. T. G. Nyborg (Armstrong, Whitworth & Co.) referred to the case of a ship in South American waters in which the hydraulic cup leathers had to be renewed every fortnight. Mr. J. H. Holmes remarked that in the old days, on cargo ships with hull return, the usual practice was to drive a wood screw through the wood lining of the ship until it made good contact with the iron. Mr. F. O. Hunt said that in hoists the greatest proportion of the momentum was stored in the rotating armature and brake drum, but this was not appreciated by many makers. The difficulty with ordinary brakes was that they absorbed energy at a rate proportional to the peripheral speed, whereas for smooth stopping they should absorb at a rate proportional to the square of the speed. Mr. W. Baxter (A. Reyrolle & Co.) said that unfortunately the electrical plant had to give way to everything else, with the result that motors were often stuck in inaccessible places. He considered that electricity had been pushed too far in battleships, and that well-designed clutches were superior to controllers for many purposes. For two-stage loading he suggested a modified Barlow gear controlled by a simple reversing motor. He thought that it would be a mistake to open the firing circuits automatically, and that it was better to depend upon the turret danger signals. Mr. Pyne briefly replied to the various points raised.

**Boycott of German Goods in Prague.**—According to the *Elektrotechnische Zeitschrift*, one of the oldest electrical firms of Berlin, has successfully petitioned that the German Ambassador in Vienna should approach the Austro-Hungarian Government with the object of annulling the recent restrictions of the Prague Electricity Supply Authorities so far as electric motors of German manufacture are concerned.

## METAL FILAMENT LAMPS

AMONG the papers read during the meeting of the Institute of Metals, on March 12th, was one by Mr. Alexander Siemens on metal filament lamps. The earliest attempt to improve on the economy of the carbon lamp resulted in the osmium lamp, which, only using half the watts per candle power, was inferior to the carbon lamp in many respects. Its further development was interrupted by the appearance of the Nernst lamp, but the next step forward was the introduction of the Tantalum lamp in 1905, with its wire-drawn filament. This, he said, had all the good qualities of the carbon lamp, but consumed only half the current, and as many as 103 million have been sold in the last five years. Experiments were, however, being carried on meanwhile with metals of higher melting points, notably tungsten, which melts at about  $3,000^{\circ}\text{C}$ ., and the Osram lamp was produced by Auer by mixing metallic tungsten powder with organic materials to form a paste which could be squirted into threads, the additions being removed by heating in hydrogen. The colloid method of Kuzel was also mentioned, and that tried by Siemens and Halske, who mixed tungsten powder with a small percentage of nickel and pressed the mixture into rods which were heated in an atmosphere of hydrogen up to near the melting point of nickel. These rods were malleable, they could be drawn to serve as lamp filaments and their strength exceeded that of the tantalum. The filaments had to be heated afterwards in special containers to expel the nickel which would have blackened the bulbs. It was found, however, that their life was uncertain.

The next decisive step forward was made by the General Electric Co. of America, who patented in 1909 a process for making ductile tungsten, which is described in the British Patents 23,499/09 and 8,031/10, and of which the following is the fundamental fact on which the change in the properties of tungsten is based, viz., that "by repeated mechanical working, the tungsten being heated during the earlier stage of the operations, a condition is reached where the metal acquires such physical or molecular characteristics that further working may, if desired, be continued at room temperatures." The pure metallic tungsten powder is pressed into rods 13 cm. long and 4 sq. mm. in section by a pressure of about 32 tons per sq. in. In order to consolidate these rods, they are at first heated in an atmosphere of hydrogen to about  $1,300^{\circ}\text{C}$ ., and afterwards, by passing an electric current through them, to a white heat until the rod is firm enough to be hammered in a swaging machine. The treatment of heating the rod and passing it through a swaging machine is repeated until the dimensions are sufficiently reduced to commence rolling and drawing through diamond dies in the same manner as other metal wires are treated. The finished tungsten wire is silver-white and possesses a breaking strain up to 266-292 tons per sq. in. Wotan lamps with pure drawn tungsten filaments are now made in sizes varying from a 5-c.p. 110-volt lamp with a filament 0.01 mm. in diameter and 3.30 mm. long to the 2,000-c.p. 220-volt lamp with a filament 0.275 mm. in diameter and 2.6 metres long. The efficiencies vary, it is stated, from 1.1 watt per c.p. in the smaller sizes to 0.85 watt per c.p. in the largest, but it is not made clear in the paper whether British or Hefner c.p. are referred to.

The President (Prof. W. Gowland), in opening the discussion, referred to experiments which he made in conjunction with Sir William Siemens 30 years ago in the production of solid tungsten by the electric furnace. He asked how the tensile strength of tungsten compared with that of steel wire of the same diameter, and whether the ultimate malleability of the tungsten was really the result of alternate heatings and hammerings, or was due to the withdrawal of the carbon by the presence of hydrogen.

Mr. A. Philip asked for further information on the physical properties of tungsten. The tensile strength of tungsten must be considerably higher than that of steel, as he did not know of any steel for ordinary purposes which went higher than 130 tons, and it was improbable that a steel wire had ever been drawn so fine as half a thousandth of an inch. Mr. W. H. Johnson, however, remembered seeing some experiments on the breaking strain of a very fine steel wire which gave over 200 tons per square inch. Mr. G. A. Boeddicker said that tungsten appeared to be the only metal that could be made homogeneous simply by pressure. An interesting point was the annealing of the metal during the process of drawing it down. He had drawn constantan wire down to 0.0015, but it was extraordinarily difficult. Mr. E. L. Rhead gave some information about the malleability of other alloys, and Mr. J. D. Bedson spoke of the addition of tungsten to steel.

Mr. F. W. Willcox (British Thomson-Houston Co.) pointed

out that the candle-powers in the Paper were hefner and not British candle-power, which latter would be about 10 per cent. less. He considered that the development of the drawn wire filament had been one of the most revolutionary which had ever taken place in any industry. Mr. T. Boulton was not quite clear how it was possible to swage a bar of tungsten small enough to draw it through a diamond die without any intermediate rolling.

Mr. A. Siemens, in reply, said that rolling did take place, although he had not mentioned it. The strength of tungsten only reached high values when drawn very fine. In the larger sizes it was no stronger than ordinary steel wire. With regard to the President's remark as to the withdrawal of carbon, he said that the powder was prepared from a dioxide, which must be absolutely pure, and, as a matter of fact, great care was taken to eliminate the carbon.

## THE TESTING OF EBONITE

AN original communication by Messrs. C. C. Paterson, E. H. Rayner, and A. Kinnes, entitled, "Notes on the Testing of Ebonite for Electrical Purposes," has been published in the Journal of the Institution of Electrical Engineers. The authors describe an extensive series of tests on ebonite of various qualities at the National Physical Laboratory. The points to which attention was specially directed were immunity from the action of light in deteriorating the surface of the material, resulting in bad surface insulation; high electric strength; mechanical toughness, and the absence of any tendency to yield under pressure or at temperatures above that of the air.

The first was found to be present in all the samples, and none could be said to be superior to any other. The tests finally recommended for ascertaining the quality of ebonite are those of electric strength, yield, temperature, and specific gravity, and the following specification is suggested for tests on sheet ebonite purporting to be made from best Para rubber without adulteration:—

*Specific Gravity.*—To be not more than 1.21.

*Yield Test.*—A cantilever of the ebonite 25 mm. (1 in.) wide and 10 mm. ( $\frac{3}{8}$  in.) thick, supporting a 1-lb. weight 152 mm. (6 in.) from the support, shall be placed in an oven maintained at a temperature of  $70^{\circ}\text{C}$ . The ebonite shall not yield so that the point of support of the weight drops through a greater distance than 15 mm. (approximately  $\frac{5}{8}$  in.) during two hours at this temperature. The distance dropped shall be measured before and after the test with the weight removed.

*Electric Strength.*—The sheet ebonite shall be tested for electric strength by embedding metal spheres, 51 mm. (2 in.) diameter, into opposite sides of the material so that the thickness of ebonite between them is about 0.5 mm. An alternating potential difference with an approximately sine wave distribution shall then be put across the spheres, and the voltage gradually raised over a period of about 1 minute until breakdown occurs. The test specimens and spheres may be placed under oil during this test, in which case a specimen 100 mm. (4 in.) diameter will suffice to prevent sparking round the edges. Under these conditions of test the ebonite shall show an electric strength of not less than 125,000 volts per millimetre (R.M.S.).

*Switch Connections.*—The abridged waistcoat pocket edition of Mr. W. Perren Maycock's "Lighting Connections," which was published by Messrs. A. P. Lundberg & Sons (477-487 Liverpool Road, N.) less than a year ago, has just been reprinted as a second edition, similar in all respects to the first except that the colour of the cover is brighter. This shows that our prediction that it should prove very useful to wiremen and contractors (ELECTRICAL ENGINEERING, Vol. VIII., p. 308, June 6th, 1912) has been fulfilled. The price of the volume is 6d. net, by post 7d., from Messrs. A. P. Lundberg.

*School for Electricity Supply Canvassers.*—A school, supported by public electric supply companies, has just been opened in Chicago to give instruction in the commercial side of electricity supply. The course extends over 11 months. Half of this time outside work is done, for which the student receives remuneration.

*Large Canadian Hydro-Electric Generating Station.*—According to the *Electrical News* (Toronto) orders have recently been placed for 12 10,000-kw. vertical hydro-electric sets. The overall diameter of the generators is approximately 36 ft., and the speed 56 r.p.m. The head of water is only 30 ft. The company owning this station is the Cedars Rapids Manufacturing & Power Co. (Montreal), and the station is said to be the largest single installation ever contracted for at one time in Canada, and with the exception of the plant at present under construction at Keokuk on the Mississippi River, probably the largest in the world.

## ELECTRIC DRIVING AT A BRICKMAKING WORKS

A RECENT example of electric driving ousting the steam engine is the power installation carried out by the Northern Counties Electricity Supply Co., Ltd., at the Pelaw Terra Cotta Brick Works of Messrs. Jones Brothers, Newcastle-on-Tyne. This firm have recently replaced their 300-h.p. steam engine and two Lancashire boilers by electric motors. Current is brought from a switch-house near by by overhead cables to a sub-station in the works at 5,000 to 6,000 volts, three-phase, 40 cycles, and is there transformed down to 440 volts by a Westinghouse transformer, for supply to the motors.

The main brickmaking plant is driven by three 75-h.p. enclosed ventilated motors running at 460-480 r.p.m., and controlled by oil-immersed auto-starters, made, as well as the motors, by the British Westinghouse Co. These three complete brickmaking equipments (by Messrs. Bradley and Craven, of Wakefield) each consist of a grinding mill, mixing mill, brickmaking machine, and two represses. These sets are worked independently of each other, and are quite self-contained. The haulage from the shale pit to the works is on the endless chain system, and is operated by a 15-h.p. back-gear induction motor running at 600 r.p.m. at the works' end of the haulage. The water employed in the brick-making process is pumped from an adjacent pond by a 300-r.p.m. Daniels' single-crank vertical ram pump with a capacity of 900 gallons per hour, driven by a 5-h.p. squirrel-cage motor running at 750 r.p.m. There is a well-equipped engineering shop, and the various machines contained therein are driven by a 5-h.p. 800-r.p.m. back-gear motor. The advantages which have been realised by the conversion from steam to electrical driving are reduced labour, maintenance, and power charges, and avoidance of the complete shut-downs of the whole works, which were unavoidable when trouble occurred with the steam power plant. Standing losses are avoided and the shafting and transmission friction is considerably reduced. The consulting engineers to Messrs. Jones Brothers are Messrs. Merz and McLellan.

## GOOD ILLUMINATION

A PAPER by Mr. Leon Gaster entitled "The Economic and Hygienic Value of Good Illumination," was read and discussed at the Royal Society of Arts recently. The four electroliters in the Hall were each fitted with a different method of diffusion. The author treated the subject in his own characteristically enthusiastic way. Under the sub-heading, "The Hygienic Aspects of Illumination," he showed how bad and insufficient lighting in schools is responsible for bodily deformities as well as optical troubles. It was now generally agreed, he said, that for ordinary desk work an illumination of 2 to 3 foot-candles was necessary, and about 4 foot-candles on the blackboard. Sections of the Paper were also devoted to the avoidance of glare, good illumination as a means of preventing accidents, the meaning of "adequate illumination," and the importance of shades and reflectors. It was pointed out that different manufacturers seemed at the present time to have very different ideas as to the amount of illumination actually required to carry out similar processes. The following figures were given in this connection. In the case of six different printing works, values ranged from 3.4 to 26.8 foot-candles. Again, for printing, cotton factories, &c., these illuminations in foot-candles were given:—Clothing (machine room), 2-36; handkerchiefs (machine room), 2-8; composing rooms, 3-30; cotton weaving, 1-5; linen weaving, 3-18; while in cotton spinning and preparing rooms much lower values, ranging from 0.01 to 6 foot-candles were met with.

During the discussion, Sir Henry T. Wood narrated the history of the lighting of the room in which the meeting was held. When it was first built, about 140 years ago, it was lighted by four or five sets of oil-lamps. Each pendant had, he believed, three or four lamps. This method of lighting continued for about eighty years. Towards the middle of the last century a Bude light was installed in the centre of the room. In 1854 the oil-lamps at the four corners were removed, and a large central "Sun" gas-light was put in. This was continued until 1882, when electric light was introduced into the building. He believed this installation of electric light was the oldest in any public building in London. This lighting was effected by an Otto gas-engine and a Siemens machine, followed by the addition of an E.P.S. storage battery. In 1899 current was taken from the street mains. The first introduction of gas occurred in 1815, when the Society put up a lamp outside the street entrance. The purification being at that period very imperfect, gas illumination could not be introduced inside. In the 'thirties or 'forties gas was used on the stairs, and was gradually employed in other parts of the building.

## A COMBINED SWITCH FUSE AND PLUG

THE GENERAL ELECTRIC CO., LTD., 67 Queen Victoria Street, are introducing a new patented combined switch fuse with a plug attachment for use in docks, non-fiery mines, and other work where a flexible connection to a motor is employed. The apparatus is so constructed that neither can the switch-cover be opened, nor the plug withdrawn nor inserted with the switch closed. The switch spindle carries a cam which, when the switch is closed, presses down the upper end of a hinged steel bar. The lower end of the bar is turned at right angles and forked. In addition to its two current-carrying pins, the plug is equipped with a long steel pin, which passes through a hole in the case into the interior of the switch-box, and is so notched that it can be gripped and held firmly by the fork on the hinged bar, so that when the plug is in position and the switch closed the fork engages

COMBINED SWITCH FUSE AND PLUG.

with the steel pin and absolutely vetoes all attempts to withdraw the plug. Moreover, if one tries to insert the plug while the switch is closed, the end of the steel bar effectually blocks up the aperture through which the steel pin has to pass, so that access is completely denied, and the operator is compelled to switch off before he can insert the plug. The earthing conductor from the motor terminates at a contact in the plug, and the first step in the process of inserting the plug is to complete this earth connection. Then, and not before, the brass pins enter their sockets. On withdrawing the plug the earth connection is the last to be broken. To prevent all possibility of insertion of the plug in the reverse way, the steel pin has a projection which fits into a slot in the aperture through which the pin enters the case, like a key in a lock. The switch itself is of the Company's standard "Twinbreak" pattern, and the whole device may be obtained with or without fuses.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelopes.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,332.

The switch of a 3-phase alternator fitted with discriminating fault protection of the Merz-Price balanced type has been giving considerable trouble by opening repeatedly owing to the action of the relay without apparent cause, as no fault can be discovered in the generator. The relay connections and pilot connections are quite sound and unbroken, and the balance of the current transformers proved sufficiently good right up to short-circuit current, and, indeed, the plant often runs satisfactorily for days without trouble of any kind. The neutral of the alternator, which is in parallel with others, is earthed. "Current" balancing is utilised with a relay across the mid-point of the pilot. The current transformer secondaries are both star-connected and their neutrals earthed, and there are no overload or time-limit fuses. What is the cause of the trouble?—"Kink."

(Replies must be received not later than first post April 3rd.)

### ANSWERS TO No. 1,330.

Rotary converters when running with fixed A.C. input voltage are capable of delivering D.C. variable voltage within small range, without special boosting arrangements.

In the case of a six-phase rotary giving a D.C. voltage of 550-600, how can the power factor and exciting current be calculated for the different voltages, the A.C. input voltage being constant?

How much reactance should the transformer, which is supplying current to the slip rings, have? A. D.

The first award (10s.) is made to "ALPH" for the following reply:—

In an ordinary rotary converter, without booster or split poles, the D.C. voltage always bears a fixed ratio to the A.C. voltage impressed on the sliprings. This ratio depends on the number of phases for which the machine is wound and on the ratio of pole arc to pole pitch, but for any given machine it is constant except for the slight amount of the C.R. drop as the machine is loaded up. In a six-phase rotary of normal construction this ratio will probably be about 1.41, i.e., the diametrical A.C. voltage on the sliprings will be 0.707 of the D.C. voltage. If the field of such a converter is over-excited, i.e., beyond the amount necessary to provide sufficient flux to give the D.C. voltage corresponding to the A.C. impressed volts, the D.C. volts will not be raised, but the machine will draw a wattless leading current from the line. The M.M.F. of this current flowing in the armature will be directly opposed to the main field M.M.F., and the leading current taken will be of such amount that the armature ampere turns exactly counterbalance the extra ampere turns on the field, leaving a resultant M.M.F. sufficient to drive the correct flux through the machine. Similarly if the D.C. field is under-excited the machine will draw a lagging current sufficient to bring the total M.M.F. and the flux up to the correct value. If a reactance is connected between the A.C. line and the rotary sliprings the leading or lagging current passing through the reactance will add or subtract a voltage (proportional to the wattless current and the amount of reactance) to the voltage impressed on the sliprings; since

the D.C. voltage is strictly proportional to the slip-ring voltage, this affords a ready means of varying the D.C. voltage. In the present case the voltage range is 9 per cent., or, allowing 5 per cent. C.R. and reactance drop at full load with unity power factor, and assuming that it is necessary to obtain the full voltage range at any load from no load to full load, we have a total internal voltage variation of 14 per cent. 15 per cent. reactance in the transformer should be satisfactory for this, and allowing 3 per cent. for the reactance of the rotary we have 18 per cent. total reactance. It is now necessary to determine the voltage ratio for which the power factor is to be unity. The most economical value for this is dependant on various factors, such as the load factor of the machine, the degree to which the field can be over-excited without overheating, and the amount of wattless current which can be carried by the armature without overheating (as is well known, the armature heating of a rotary converter increases very rapidly with a reduced power factor, whether lagging or leading). We will assume as a fair average case that the power factor should be unity at 575 volts D.C. with full load on the machine; then the transformer will be wound to give a normal secondary voltage at full load, unity power factor, of  $0.707 \times 575 \times 1.05 = 426$  volts, the factor of 1.05 being, of course, to allow for the assumed drop of 5 per cent. at full load. The maximum voltage required on the slip-rings is at full load 600 volts D.C., and is  $0.707 \times 600 \times 1.05 = 445$  volts. This is an increase of  $\frac{4}{3}$  per cent. above the normal voltage, and therefore necessitates  $100 \times \frac{4}{3} / 18 = 25$  per cent. leading current, so that the power factor in the rotary armature will be  $100 / \sqrt{100^2 + 25^2} = 0.97$ . Similarly the slipring voltage at no load 550 volts D.C. =  $0.707 \times 550 = 389$  volts, a decrease of  $\frac{8}{3}$  per cent., necessitating a lagging current of  $100 \times \frac{8}{3} / 18 = 47$  per cent. This wattless current corresponds to a power factor of 0.905 at full load, but since there is no load on the machine the actual power factor will be very low, probably about 0.10 to 0.12. Generally, if  $v$  = per cent. rise or fall in voltage from the normal, allowing for the C.R. drop,  $w$  = per cent. reactance = volts across reactance with full load current flowing expressed as a percentage of normal volts, and  $A$  = normal A.C. full load current, then the wattless current taken will be  $C = A \times v / w$ , and will be a leading current when the voltage is raised and a lagging current when the voltage is lowered. Knowing the efficiency of the rotary, the load current input corresponding to any particular load and voltage is readily obtained, and calling this current  $I$ , the power factor in the rotary armature will be  $P = I / \sqrt{I^2 + C^2}$ . On the supply side of the reactance the current will, of course, lag further behind the volts than on the rotary side, and the power factor on the line will be  $P' = IVr + (I^2 + C^2) / V \sqrt{I^2 + C^2}$ , where  $I$  = A.C. load current,  $C$  = A.C. wattless current,  $Vr$  = volts on slip-rings =  $V(1 \pm v)$ ,  $V$  = transformer secondary volts at unity power factor, and  $r$  = C.R. drop at full load.

To determine the exciting current required, first determine in the usual way the ampere turns to give the required voltage if the machine were running as an ordinary D.C. generator without load. Call this  $At$ . Next determine the equivalent D.C. armature reaction of the machine at full load from the equation  $Ar = \text{D.C. current per path in armature at full load} \times \text{number of armature conductors} \div \text{twice the number of poles}$ . Then if  $V$  and  $W$  have the meanings assigned to them above, the total ampere turns per pole will be  $At \pm VAr / W$ , using the + sign for increased voltage and the - sign for decreased voltage. To the ampere turns thus found it will be necessary to add a small percentage of the armature reaction if the brushes are not on the neutral, say about 10 to 15 per cent. at full load and proportionately for other loads. The exact amount of this final correction can only be determined on test. Having determined the ampere turns, the proportion of these which should be series turns (if the rotary is to be compound wound), also the number of shunt turns and the shunt field current, are obtained exactly as for the field coils of a D.C. generator.

It is usual to allow about 15 per cent. reactance in the transformer for this method of control. More reactance is commercially difficult to obtain in a good transformer, and less reactance leads to excessive wattless currents for the amount of voltage regulation usually required.

The second award (5s.) has been made to "C.E.B."

## "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

### Specifications Published March 20, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

4,460/12. **Regenerative A.C. Commutator Motors.** BROWN, BOVERI. To obtain regenerative working of single or polyphase commutator series motors, two or more saturating magnetic fluxes displaced in time are introduced into the system. Six figures.

8,569/12. **Discriminative Protective Gear.** B.T.-H. and E. B. WEDMORE. Pressure transformers are connected between the phases of the system and earth, and a relay is excited from these transformers. The currents in the windings of the relay normally neutralise one another, but when a fault occurs there is a resultant magnetising current in the windings, which is practically in phase with the pressure to earth, and operates the relay. Three figures.

10,534/12. **Submarine Telegraphy.** J. GOTT. The system described in ELECTRICAL ENGINEERING (Feb. 27th, 1913, p. 120). The direction of the current is reversed for each signal.

15,483/12. **Arc Electrodes.** B.T.-H. (*G.E.C., U.S.A.*). To steady the magnetite arc, the current is led into the electrode at right angles to the arc and in equal symmetrical branches. The positive electrode is a disc shape. Four figures.

17,778/12. **Light Baths.** G. E. GAFFE. For the local treatment of parts of the body, the hinges connecting adjacent elements also serve as couplings for the lamp circuits. The elements are bell-shaped or rectangular. Seven figures.

21,471/12. **A.C. Commutator Motors.** SIEMENS SCHUCKERT. To improve the running of the motor, a transformer is placed in series between the stator and rotor. The transformer winding connected to the stator is connected in star, and that connected to the rotor is in mesh. One figure.

### Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

**Arc Lamps:** KORTING & MATHIESEN [Trimming indicator] 253/13.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** WILSON [Storage battery charging] 9,593/12; WILLIAMS [Movable sleeve for inspection of wires in cables] 21,215/12.

**Dynamos, Motors, and Transformers:** HARTMANN & BRAUN [Metal vapour rectifiers] 5,345/12, 5,415/12, and 18,603/12; MACKIE [Rotary converters] 10,804/12; MASCH. OERLIKEN [Repulsion motor] 11,434/12; REY [Generating set] 18,025/12; BERDON [Brush-holders] 20,224/12.

**Electrometallurgy and Electrochemistry:** JOHNSON (*Badische Anilin und Soda Fabrik*) [Electrolysis of alkaline chlorides] 16,779/12.

**Heating and Cooking:** DOWNE and B. & K. ACCESSORIES [Cooking apparatus] 25,586/12.

**Ignition:** MACKAY [Testing spark-plugs] 12,672/12.

**Incandescent Lamps:** JAHODA and ELEK. GLÜHLAMPENFABRIK "WATT" SCHARF LÖTTI & LATZKO [Filament manufacture] 7,977/12; BAILEY and McDOWELL [Filament manufacture] 20,621/12; GILL (*Wolframlampen*) [Supports for metal filaments] 26,249/12.

**Instruments and Meters:** SEIBT [A.C. frequency measuring and speed indicating] 16,874/12.

**Switchgear, Fuses, and Fittings:** MASCORD [Motor controllers] 26,864/11; JOEL [Portable battery lamps] 5,170/12; MÜLLER [Holders for lamps, switches, plugs, &c.] 6,395/12; WYNNE [Switches] 26,517/12.

**Telephony and Telegraphy:** SIEMENS BROS. & Co. (*Siemens & Halske*) [Automatic and semi-automatic telephony] 2,320/12; KILLAR and GROVE [Telephones] 9,714/12; TORIKATA, YOKOYAMA and KIAMURA [Dischargers for wireless] 10,823/12; PORE [Telegraphy] 11,604/12; BAUMANN [Telephony] 18,677/12; RHODES [Telephonic transmitters] 20,196/12; KELTY [Telegrapher's key cushion] 27,079/12.

**Traction:** STRACHAN and STRACHAN & HENSHAW [Telphers] 190/12; POTTS [Signalling] 6,050/12; EMMETT [Signalling on and stopping trains] 21,723/12.

**Miscellaneous:** B.I. and H. and BAYLES [Condensers] 2,701/12; HEINRICH [Production of active carbon masses] 2,862/12; BLANCHARD [Electrostatically separating minerals, &c.] 6,772/12; ELECTROMOTOR EQUIPMENT and ARCHER [Opening and closing lift gates] 11,500/12; SOZZI [Primary batteries] 20,101/12; WEIKEL and WEIKEL [Alarms] 21,939/12.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Distributing Systems, &c.:** KRUPP [Connections for D.C. apparatus] 1,407/13.

**Dynamos, Motors, and Transformers:** VEDOVELLI, PRIESTLEY & Co. [Manufacture of small power transformers] 4,090/13; LJUNGSTRÖM [Commutator machines] 4,773/13; CIE. POUR L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON [Automatic regulators for variable-speed dynamos] 5,020/13.

**Incandescent Lamps:** CHARLES [Filament arrangement] 5,028/13.

**Storage Batteries:** KETTERING [System] 5,545/13.

**Switchgear, Fuses, and Fittings:** DE FRETES [Contacts for flashers] 3,006/12; APPAREILLAGE GARDY [Switch-fuses] 4,686/13.

**Telephony and Telegraphy:** SIGNAL GES. [Wireless radiating system for aeroplanes] 736/13; SHREEVE [Telephone repeater system] 4,611/13; BETULANDER [Automatic telephone impulse transmitters] 4,792/13.

**Traction:** CLARK [Automatic wireless train control] 4,901/13.

**Miscellaneous:** A.E.G. [Automatic ticket printing by selectors] 3,680/13; IMME [Typewriter] 4,405/13.

### Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

6,685 of March 28th, 1899. **Standard Cells.** R. O. A. HEINRICH. Certain improvements in the construction of H-type cells are covered. Diaphragms, for use between the liquid electrodes and the electrolyte, which permit of the liberation of any air accumulating under them on their being fixed in position, are constructed of two discs fixed to an escape tube. Porous packing is placed between the discs. The lower disc is funnel shaped.

6,712 of March 28th, 1899. **Common Battery Telephony.** G. ABOILARD ET CIE. The specification is a long one, and there are 12 sheets of drawings. Supervisory signals, exchange connections, and apparatus, and connections for junction line signalling are described.

6,883 of March 30th, 1899. **The Silent Discharge.** M. OTTO. An apparatus to produce ozone, &c., by gradual and successive startings and interruptions of the discharges between the various opposing points of the electrodes is described. It is similar in principle but different in construction from that described in specification No. 11,010/97. In this case movable separating discs, having alternately conducting and insulating sectors, are arranged between the electrodes. Thus short circuits are prevented.

6,982 of April 1st, 1899. **Induction Coils for Wireless.** G. MARCONI and the MARCONI Co. Coils for use as in specification No. 12,326/98 (*ELECTRICAL ENGINEERING*, Vol. VIII., p. 296. May 30th, 1912), are made very short—not exceeding two cms. in length—or else are wound in sections. The turns per layer of secondary, and sometimes of the primary, are diminished as the distance from the centre is increased. It is also desirable to connect direct to the coherer (not through the condenser) the end of the secondary remote from the nucleus. Diagrams and particulars of coils are given.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Arc Lamps:** T. L. CARBONE [Inclined carbon lamp using pure carbon electrodes] 26,772/03; F. JANECK [Thermally controlled lamp—the carbons are provided with fusible pins] 25,257/05.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** J. WILKINSON [Reinforced asphalt or earthenware conduits] 26,220/04; SIEMENS SCHUCKERT [Rolling mill motor control] 27,073/07.

**Heating:** O. HAWKES [Convecter with openings at top and bottom and baffle plates] 25,032/05.

**Ignition:** ALBION MOTOR CAR Co. and T. B. MURRAY [Details of magneto construction] 27,570/06.

**Switchgear, Fuses, and Fittings:** W. FAIRWEATHER (*Crocker Wheeler Co.*) [Motor controllers of the knife-switch type—the switches are interlocked so that they can only be closed in a certain order] 24,186/99; W. B. CLEVELAND [Cable connectors for stranded cables and method of fixing in the cable suitable for use where there is much vibration] 21,991/00 and 22,010/00; H. LEITNER, R. N. LUCAS and H. HILL [Automatic accumulator charging switch] 26,374/04; B. T.-H. (*G.E.C., U.S.A.*) [Automatic electro-magnetic motor starter] 27,038/07.

**Traction:** B.T.-H. (*Union Electricitäts Ges., Berlin*) [Trolley wire supports] 24,457/01; SIEMENS BROS. & Co. (*Siemens & Halske*) [Hand levers and gearing for block signalling instruments] 26,920/07.

**Miscellaneous:** B. J. B. NOLLS (*Gamewell Fire Alarm Teleg. Co., U.S.A.*) [Fire alarm system in which interference between the circuits is prevented] 26,541/02.

## THE "ELECTRIC ARC"

UNDER this title Mr. W. B. Hird (Mavor & Coulson, Ltd.) delivered a lecture in Edinburgh recently to the Scottish Local Section of the Institution of Electrical Engineers. The *Electric Arc*, it will be remembered, is a small experimental electrically-driven boat built by Messrs. Mavor & Coulson, Ltd., to demonstrate the flexibility of electrical control. Information as to this vessel has appeared in *ELECTRICAL ENGINEERING*, Vol. VII., June 15th, 1911, p. 330, and Sept. 7th, 1911, p. 500.

Mr. Hird began by pointing out that turbine speeds vary from 1,200 to 3,000 r.p.m., while propeller speeds vary from 90 to 120 r.p.m. only. Dealing with D.C. electrical gearing, commutation gives much trouble, he said, but speed regulation is more easily obtained than with A.C. motors. Pole-changing and cascade working are both rather complicated, while with a spinner motor three speeds may be obtained. It is also desirable that the generators do not have to run in parallel, and that the motors be of the squirrel-cage type. The *Electric Arc* was built at Dumbarton by Messrs. Maclelland & Whitson, Ltd. It is 50 ft. long, with a 12-ft. beam, moulded depth 7 ft. 4 in., and maximum draft 4 ft. 6 in. The displacement is about 19 tons. The propeller diameter is 3 ft. 6 in. A four-cylinder internal combustion engine drives a 310-volt alternator having 72 slots containing two windings of six wires each. The frequencies obtained from the windings are 20 and 33½. The control of the driving motor is effected from the bridge by two inter-locked switches, one controlling the excitation of the alternator, and the other the direction of supply to the motor in one or both windings.

The discussion was opened by Professor F. G. BAILY (Heriot-Watt College, Edinburgh), who apparently regarded the obstacles in the way of electrical ship propulsion as very formidable. With cascade motors, would both have to run dead slow, he asked, when dead-slow ship speed was required? As the maximum torque was required for reversing, he did not think that a squirrel-cage motor could be designed for this work. The Author, however, replied that experiments had showed that it did not take the full torque corresponding to the load power to reverse the propeller rapidly, since a propeller as a turbine had a very low efficiency. The squirrel-cage motor was satisfactory on small boats, but on bigger ones it would fail, though there were considerations which indicated that larger sizes of squirrel-cage motors could be used.

Mr. J. A. ROBERTSON (Burg Electrical Engineer, Greenock) could not reconcile the author's statement about the difficulty of synchronising on board ship, and the statement that one of the advantages of electrical propulsion was the concentrated power of one generator and one motor. Mr. Hird replied that the scheme considered did not prevent a combination of three alternators and three different motors unless the latter were all of the multiple-wound type. With three separately-driven propellers they would have to synchronise. Mr. SAM MAVOR mentioned a scheme for driving a 500-ton yacht in which the weights of machinery were steam 100 tons, and electric 90 tons. The centre of gravity was also lower in the latter case, and there was greatly increased accommodation and convenience. The Chairman (Mr. McWhirter) made a few remarks, and Mr. Stevenson and Mr. J. S. Nicholson also spoke.

## SOME USES OF THE STROBOSCOPE

AT a recent meeting of the Western Section of the Institution of Electrical Engineers, which was held in Bristol, Professor D. Robertson (Merchant Venturers' Technical College, Bristol), gave a lecture on, and showed some interesting experiments with the Stroboscope. The lecture dealt mostly with mechanical applications, such as the investigation of the noise of gears, hammering of tappets on cams, combustion of gases in the cylinders of internal combustion engines, whipping of shafting and torsion when shafting is under a uniform torque. The slip of induction motors was demonstrated and the calibration of motor-type meters was discussed. The lecturer suggested that the discs should be marked with, say, 117, 120 and 123 spots in three circles representing 2½ per cent, up and down from correct speed. If the load was then put on the meters in series the glimpses given of the disc so arranged for the correct speed of the

disc corresponding to the given load would show the middle circle of dots appearing to remain stationary when adjusted by means of the permanent magnet. He suggested that this would be far quicker than taking the speed of the disc by means of a stop-watch and very much more accurate. The phase swinging of alternators when the same were synchronised was clearly demonstrated by means of the stroboscope. The hunting effect being very clear when the machine was put in slightly out of step.

## CATALOGUES, PAMPHLETS, &c., RECEIVED

**REFLECTORS FOR INCANDESCENT LAMPS.**—The British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.), have just issued new editions of two folders which have spaces for the names of contractors. One folder, with a bold cover design, deals with the advantages of the well-known Veluria glass reflectors, the various patterns of which are illustrated. The second deals concisely with Mazda lamps, Veluria, Holophane, and Mazdalux reflectors. Short notes supplemented by diagrams are given, and the uses of each type. The list is made complete by the inclusion of the prices of the galleries suitable for use with the various shades, and an article entitled "Why Scientific Reflectors are Necessary."

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**ALUMINIUM.**—New leaflets from the British Aluminium Co., Ltd. (109 Queen Victoria Street, E.C.), illustrate aluminium collector bows, aluminium low pressure feeders for light railways, and miscellaneous fittings.

**CONDUITS AND FITTINGS.**—The 1913 edition of the convenient pocket catalogue dealing with conduits and accessories, distribution boards, and water-tight fittings issued by Simplex Conduits, Ltd. (116 Charing Cross Road, W.C.), and which is just to hand, contains in a condensed form practically all the matter falling under the above heads in the firm's general catalogue.

The size is only 8 in. by 4 in., so that it may be easily carried by a contractor for reference on the job. One or two new designs of conduit fittings have been added, notably back outlet bends and tees; these are intended for screwed conduit installations, and have heavy cast covers to serve as a drawing point where a branch is taken off at right angles to the main run of conduit. We illustrate a short arm tee.

**TOOL STEEL.**—An interesting book from Cammell, Laird & Co., Ltd. (Cyclops Steel & Iron Works, Sheffield), forms a catalogue of the various special tool and other steels which the firm supply. A very large number of different brands are included for different classes of tools, and such special steels as magnet steel, nickel and automobile steels, &c., are dealt with.

## ANSWERS TO CORRESPONDENTS

"MAN."—(1) We will possibly publish this for competitive replies. (2) The Wiring Rules of the Institution of Electrical Engineers (which we can send you, post free, 7d.) contain extracts from the Board of Trade and Home Office Regulations so far as they relate to wiring, and work in accordance with them is accepted by practically all fire offices and a large number of corporations. Most corporations, however, publish certain requirements to which installations must conform before being connected up, and in some cases these embody a few rules as to wiring details more stringent than the Institution code. (3) The speed is about 192,000 miles per second. The measurement is a difficult and delicate one, and you could not expect to perform it with the apparatus likely to be at your disposal.

## FARADAY HOUSE.

ESTABLISHED 1889.

### A NEW PLUG FOR FIXING WIRING

WE illustrate here a new plug which W. T. Henley's Telegraph Works Co., Ltd. (Blomfield Street, London Wall, E.C.), have brought out for fixing the link clips, saddles or protective covering used in the Henley wiring system (ELECTRICAL ENGINEERING, September 28th, 1911, Exhibition Supplement, page 31) to plaster, brick, marble, slate, stone, &c. This device should prove very useful for many purposes as a good fixing can be obtained with a minimum

PLUG IN POSITION  
READY FOR SCREW.

PLUG EXPANDED BY  
SCREW.

amount of labour and trouble. The hole that is made for the plug is only a little larger in diameter than the screw that fits it. The plug is made of stiffened fibres which expand when the screw is driven in. The company inform us of two very satisfactory tests of the holding power of these plugs. In one case two holes were punched in plaster 12 in. apart, and an iron rod  $\frac{1}{4}$  in. in diameter was secured with a link clip. When over 50 lbs. pull was exerted, the plaster around the plugs broke away. In another case, a hole was drilled in brick, and the same iron rod was secured in a similar manner. When something over 100 lbs. pull was exerted, plug was withdrawn.

Ferranti A.C. Meter.—The Board of Trade have approved the Ferranti A.C. meter, type C.

### ELECTRIC TRACTION NOTES

A number of London and Greater London local authorities appeared before the Court of Referees in the House of Commons last week, asking for a *locus standi* against Clause 16 of the Metropolitan Electric Tramways (Railless Traction) Bill when this measure comes before a committee in due course. The point is a rather interesting one, as under the clause in question the Board of Trade would be given powers to sanction other trolley omnibus routes, presumably on any part of the Tramways Company's system. A similar power has been already inserted in a number of provincial trolley omnibus Bills, but owing to the multiplicity of local authorities in London the position is very complicated, and it is feared that the Board of Trade may be in the position under the clause of sanctioning trolley omnibus routes without the local authorities having the right to be heard. The whole question will, however, be discussed before the Parliamentary Committee, as the Court of Referees granted the *locus* asked for.

As we have previously mentioned, the East Ham Council have been in negotiation with the Barking Council with regard to the leasing of the latter's trams, but it has not been found possible to arrange terms.

A service of "pay-as-you-enter" tramcars was put into operation in Leicester on Wednesday last week.

The Merthyr Corporation have accepted an offer of the Merthyr Electric Traction & Lighting Co. to pave certain portions of the tram track with wood sets on condition that the period within which the Corporation may purchase the lines is extended by ten years.

A centre-entrance double-deck car is being built for the Washington Railway and Electric Company. The stairways are at the ends of the car and terminate on a platform two steps below the upper deck floor level, and at that point turn right and left for the final rise. Fifty seats are provided on each deck. There will be four motors of 32 h.p. each, says the *Electric Railway Journal* (New York). At the ends of the

car there will be latticed steel columns, rigidly framed into the steel sheathing of both decks and connected also to the plate at the eaves. By this construction the whole side assists in supporting the weight of the car and its load.

From the electric railway statistics of the Dominion of Canada for the year ending June 30th, 1912, the total length of single track appears to be 1,723.5 miles. The average working expenses are 60.7 per cent. of the gross earnings. The total number of passenger cars in service was 3,489, and the number of freight cars 989. In addition, says the *Electrical News* (Toronto), about twenty-nine miles of track have since been put into operation, and nearly 100 miles will be opened shortly.

In view of the increasing price of petrol, and the proposed substitution in Berlin of electric vehicles for the present petrol-driven taxis, it is interesting to note that according to the official Berlin police returns, there are 277 electromobiles working as public vehicles in Berlin. This number is 12.6 per cent. of the total number of 2,194 power-driven cabs, and 5 per cent. of the total number of cabs (Droschken). Of the 277 electric cabs, 178 belong to one company, while 31 are owned by their drivers. Over 200 of these were manufactured by the Neuen Automobil-Gesellschaft (A.E.G.).

### TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

A Reuter telegram from Melbourne states that the Federal High Court has allowed an application by Marconi's Wireless Telegraph Co. to inspect the Government's wireless apparatus in connection with the Company's action against the Government for infringement of the Marconi patents.

In an action for libel by the Attorney-General (Sir Rufus Isaacs) and the Postmaster-General (Mr. H. Samuel) against the French daily paper, *Le Matin*, Sir Rufus Isaacs stated that he had purchased 10,000 shares in the American Marconi Co. prior to the sanctioning of the agreement with the English Marconi Co. for the imperial wireless telegraph scheme. He said that he had been expressly informed that the American Marconi Co. was totally distinct from the English Company. One thousand of these shares he sold to the Chancellor of the Exchequer (Mr. Lloyd George) and another thousand to the Master of Elibank. The whole of the facts are now being explained to the House of Commons Committee by Sir Rufus Isaacs, who will be followed by Mr. Lloyd George.

It is reported that the U.S. scout *Salem* has recently received complete messages from the 70-kw. Fessenden wireless station at Arlington at 2,400 miles in full daylight.

Experiments carried out in a balloon in Prussia last January show that wireless transmission is not so easy at great heights as near the earth's surface. Drs. Wigand and Lutze, in a short article in the *Elektrotechnische Zeitschrift* of March 6th, describing the experiments, state that at a height of 6,500 metres the signals received from the Norddeich station were less than half as strong as those received from the same station at a height of 1,500 metres, the distance being about the same in each case. It was further proved that the difference of altitude did not affect the sense of hearing or the sensitiveness of the detector, so that the reduction in the wave strength was due to altitude only.

Telegraphic communication with the States of Coahuila, Chihuahua and Sonora in Mexico was down on 18th inst., and on the following day the Teheran-Meshed line was also broken, but was repaired on the 20th.—The Oran-Tangier lines gave out on 22nd inst., and as a result of heavy storms in Ontario, Canada, and the United States of America, land lines in those countries have been considerably disturbed, which must cause delay to telegrams in transit.—The line between Teheran and Kermanshah is down between Hamadan and Kermanshah.—The cables between Shanghai and Nagasaki are down, cutting off the direct lines to Japan, which can be reached *via* Formosa, subject to delay.

**The Batti-Wallahs.**—The annual dinner of this Society was enjoyed by a large gathering on Saturday, March 15th. Mr. Collis, the retiring President, took the chair, and a feature of the evening was the original menu and programme in the form of a uniform cap embellished with humorous illustrations. Mrs. J. Cornille, Mr. Martin Muir, Miss Ada Fox, Mr. Olley Oakley, Mr. Ernest Pike, and Mr. Louis Nikola entertained the guests. The second number of the Batti-Wallahs' Journal was distributed at the dinner, and contains numerous items mostly of a personal and humorous nature that will interest members of this energetic Society.

### LOCAL NOTES

**Belfast: Street Lighting.**—A number of additional streets are to be lighted by means of electric arc lamps. This decision is the result of experiments in other streets with centrally hung arc lamps, which have proved so much more satisfactory than the previous gas lighting.

**Bingley: Bulk Supply.**—The proposed agreement with the Keighley Council for a supply of electrical energy in bulk, referred to in our last issue, has now been passed by the latter body on the terms already given.

**Carlisle: Salary of Electrical Engineer.**—A long debate took place last week with reference to a proposal of the Electricity Committee to advertise for a successor, at a salary of £500 per annum, to Mr. S. T. Allen, the Borough Electrical Engineer, who has recently been appointed to a similar position at Wolverhampton. The objection was to the amount of the salary, and various amendments were moved fixing it at £350 or £400 rising to £500. Eventually, however, the Committee's recommendation to offer £500 per annum to commence with was adopted.

**Dublin: Electricity Profits.**—It has been stated that a sum of £10,000 would be available for relief of rates from last year's electricity profits, but the Electricity Committee are rather averse to handing over such a large sum, their desire being to build up a reserve fund first.

**Durban: Electric Heating.**—A reduction has been made in the price of electric current with a view to encouraging its use for electric heating and cooking. As we pointed out some time ago, Mr. J. Roberts, the Borough Electrical Engineer, has designed a cheap form of electric cooker, and the Council will shortly be asked to adopt a scheme for the supply of apparatus on the hire-purchase or some similar system.

**Gloucester: Rateable System of Charging.**—The Corporation has adopted a recommendation to give consumers the option of taking a supply of electricity at the ordinary rates, or on the basis of 12½ per cent. upon the rateable value of their premises, plus 1d. per unit for all energy consumed.

**Galaahiel: Electric Supply.**—Mr. T. C. Parsons, who has been consulted by the Council with regard to an electric supply scheme, has advised that the lowest charge for power should be ½d. per unit, but the local manufacturers contend that current must be supplied at ¾d. per unit for this purpose. The Committee in charge of the matter is strongly in favour of the ¾d. per unit charge, and a conference between the Council and the local manufacturers has been adjourned in order to obtain further information.

**Grimsby: Supply of Cables.**—The Borough Electrical Engineer is to visit Vienna in order to test cable to the value of £1,500, which is on order from there. The cost of the visit is estimated at £27, but at the last meeting of the Council it was pointed out that the saving by giving the order abroad was £500.

**Hornsey: Electricity Charges.**—At the last meeting of the Council attention was called to the fact that the Electric Lighting Committee has £5,000 in hand, and a request was made for a reduction in the charges to consumers. The Chairman of the Lighting Committee, however, stated that this course could not be entertained at present. The Committee was anxious to pay back to the ratepayers the £7,000 which had been contributed to it during the early years when losses were incurred. Nevertheless the Committee has this year voted £500 to relief of rates.

### TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-Stations, Mains, &c.

**Canada.**—The date for receiving tenders for the generating sets required by the Swift Current Council, referred to in our last issue, has been extended to April 14th.

FOR  
**STEAM JOINTS**  
USE

JOHN HUDSON & CO.'S SUCCESSORS, Mansell St., London, E.

**Chile.**—An electric generating station and distribution system is required at the Port of Valparaiso. Particulars may be seen at the offices of the Chilean Legation, 48 Grosvenor Street, W., any day except Saturdays, between 3 and 5 o'clock. Tenders by September 10th.

**Dundee.**—E. H. T. switchgear and transformers. City Electrical Engineer. April 4th. (See an advertisement on another page.)

**Grimsby.**—In connection with the extensions at the electricity works, a certain revision in the estimates has been found necessary in consequence of the need for an additional feeder panel, extension of the cooling towers, and an oil separator.

**Haywards Heath.**—A Board of Trade inquiry has been held concerning an application by the Mid-Sussex Electric Light and Power Co. for a provisional order.

**New Zealand.**—An electrical installation is required at the Queen Street wharf, Auckland. Particulars from Harbour Board.

**Peterborough.**—1,023 yards of cable. City Electrical Engineer. March 31st.

**Waterford.**—The Guardians have under consideration an electrical installation at an estimated cost of £3,000.

**Woodford.**—Arrangements are being made by the Walthamstow Council to give a supply of electricity in this district.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Cardiff.**—Premises for South Wales Mining School. Architects, Teather & Wilson, Andrews' Buildings, Queen Street.

**Dalkeith.**—New fever hospital.

**Dundee.**—Additions at Westgreen Asylum. Architect, T. M. Cappon, 32 Bank Street.

**Greenock.**—Cinematograph theatre.

**London: Lewisham.**—Wiring and fittings for 500 lights in workhouse, and a similar number in infirmary. Clerk to Guardians. March 31st.

**Paignton.**—Business premises. Architect, F. G. Moore, 9 & 10 Fleet Street, Torquay.

**Swansea.**—New police station.

**West Ham.**—Electric lighting of Guardians' workshops, Aldersbrook Road, Wanstead. Architect, W. Jacques, 2 Fen Court, E.C.

**Worcester.**—New school.

### Miscellaneous

**South Africa.**—The Bloemfontein Council have decided to proceed with their trackless trolley system at an estimated cost of £80,000.

## TENDERS RECEIVED AND ACCEPTED

**Belfast.**—Thirteen tenders have been received by the Harbour Board for the supply of four 5-ton electric gantry cranes. These have been referred to the Engineer for report.

**Hornsey.**—A contract for meters has been placed with Messrs. Chamberlain & Hookham.

**Manchester.**—The tender of Messrs. Anderson, Ltd., of Salford, has been accepted for an electric lighting installation at the Crumpsall Workhouse.

**Salford.**—The tender of Messrs. Davenport, Sparrow & Co. has been accepted for the electric lighting of the new juvenile labour bureau, and that of Messrs. Willoughby & Wilcox for the electric wiring of the Committee's new laboratories and workshops.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £68 15s. to £69 5s. (last week £69 to £69 10s.).

**Bankruptcy.**—A first and final dividend of 2 1/16d. in the £1 will be paid on April 8th at the offices of Messrs. Elles, Salaman & Co., 1 & 2 Bucklersbury, E.C., in the bankruptcy of the late Mr. F. H. Medhurst, consulting electrical engineer.

## APPOINTMENTS AND PERSONAL NOTES

A Clerk of Works is required for the new electricity station at Bolton. Salary three guineas a week. Town Clerk, April 10th.

The Manchester City Council have sanctioned the following increases of salaries in the Electricity Department:—Mr. L. H. Marlor, installation inspector, £220 to £235; Mr. F. R. Radcliffe, chief rental clerk, £215 to £225; Mr. E. J. Constable, assistant resident engineer, city stations, £200 to £220; Mr. L. K. Lee, mains engineer, £450 to £475; Mr. H. A. Ratcliff, head of testing department, £300 to £325; and Mr. E. Bolton, sub-stations engineer, £350 to £375.

## COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**W. T. Glover & Co.**—At the annual meeting last week satisfaction was expressed with the past year's trading, which has permitted of the payment of a 5 per cent. dividend on the ordinary shares, together with a bonus of 2 1/2 per cent.

**British Insulated & Helsby Cables.**—At the annual meeting last week attention was called to the fact that, notwithstanding the coal strike last year, the company's turnover has been largely increased as the result of general prosperity throughout all departments. The directors have every confidence in their large holding in the Automatic Telephone Co., and for the past year it will not be necessary for them to provide anything under their guarantee in respect of the dividend on that company's preference shares.

**South Wales Electrical Power Distribution Co.**—The total units sold last year, viz., 19,689,656, show an increase of 5,319,081 over the previous year. The working results show that after meeting all expenses and interest on prior lien debenture stock, and making provision for depreciation, there is a fairly substantial surplus which, according to agreement, will be utilised in discharging the indebtedness to certain consumers of the Treforest Company.

**British L.M. Ericsson Manufacturing Co.**—At the annual meeting last week a smaller revenue was reported for 1912 than for 1911, due to the fact that in the latter year the Postmaster-General put through a considerable number of orders in anticipation of the acquisition of the National Telephone Co. The prospects, however, are considered particularly favourable in view of the present position of telephones in this country, and the directors have every expectation of a very successful year. Regret was expressed at the decision of the Postmaster-General to continue the policy of the National Telephone Co., and withdraw the hand micro-telephone from use in this country. It was pointed out that France has made this a standard, and other countries are installing it. The net profits for the past year amounted to £18,562, and an 8 per cent. dividend is to be paid on the ordinary shares.

**British Aluminium Co.**—After providing £40,000 for depreciation, and carrying £30,000 to reserve, the profits for 1912 allow of the payment of the full 6 per cent. preference dividend, and the carrying forward of £10,206.

## NEW COMPANIES

**ARDWICK ELECTRIC REGULATOR CO.**, 52 Queen Street, Ardwick, Manchester.—Capital, £1,000. To acquire certain inventions relating to controllers for electrical purposes.

**GENERAL TELAUTOGRAPH CO.**, 20 Bucklersbury, E.C.—Capital, £1,000. To adopt an agreement with the National Telewriter Co.

**NORTH BRITISH DIESEL ENGINE WORKS.**—Capital, £1,000,000. In 500,000 preference shares, and 500,000 ordinary shares of £1 each.

**PERNAMBUCO TRAMWAYS & POWER CO.**—Capital £1,000,000.

**CITY OF LAS PALMAS WATER & POWER CO.**—Registered by Ashurst, Morris, Crisp & Co., 17 Throgmorton Avenue, E.C. Capital, £125,000. To acquire a concession for the supply of electricity in Las Palmas.

**WOODBIDGE & DISTRICT ELECTRIC LIGHT CO.**—Capital £4,000. To adopt an agreement with Rural Districts Electric Undertakings, Ltd. The directors include Mr. Haydn T. Harrison and Mr. W. Riggs.

**BRITISH ELECTRIC HEATER CO.**, 105 West George Street, Glasgow.—Capital, £50,000.

## SUMMARY

THE Council of the Institution of Electrical Engineers have nominated Mr. W. Duddell for a second year of office as President. Other nominations for the new Council are also published in an article on p. 183.

THE preliminary programme of the forthcoming convention of the Incorporated Municipal Electrical Association has been issued. (Page 183.)

MR. A. E. HADLEY's Paper on power supply on the

Rand has been discussed by the Manchester Local Section of the Institution of Electrical Engineers. (Page 183.)

A PAPER by Mr. J. P. Tierney, read recently before the Dublin Local Section of the Institution of Electrical Engineers, discussed the relative merits of petrol-electric and other self-propelled cars for light railways, and described a car that has been designed for through running from the Dublin tramway system to the Dublin and Blessington light railway hitherto worked by steam. (Page 184.)

THE results of an exhaustive series of tests by the U.S. Bureau of Mines on explosion-proof protective devices for electric motors showed that each of five types of protection tested was liable to failure under certain conditions. A combination of gauze and battle plates at the commutator end or a set of plates at each end of the motor appears best. (Page 185.)

THE beneficial effect resulting from the introduction of electric safety lamps in mines was urged in a recent lecture by Mr. W. Maurice at a joint meeting in Nottingham. (Page 185.)

A NEW mines telephone set, in which flame-proof protection instead of the gas-tight system is employed, is described on page 186.

SOME information as to the various uses of electricity and the power required for different classes of machinery used in precious-metal mining is given. (Page 187.)

AN illustrated description is given of an "emergency" electric lamp for mines. (Page 182.)

SEVERAL patent specifications of interest to mining electrical engineers were published last month. Included are a safety lamp by H. F. Joel, a differential catalytic detector by A. Guasco, and water-tight bells by E. A. Graham. The metallurgical patents include one for an induced current furnace with revolving inductor by J. Bally. (Page 188.)

A PAPER on electric heating and cooking, by Mr. T. Roles, has been discussed by the Yorkshire local section of the Institution of Electrical Engineers at Leeds and at Sheffield. (Page 189.)

THE electric lighting of a printing works is described in an illustrated article. (Page 190.)

A PROBLEM connected with the earthing of the neutral in mining installations is propounded in our "Questions and Answers" column. (Page 191.)

THE Specifications published by the Patent Office on Thursday last included one by the Maschinenfabrik Oerlikon for a single-phase repulsion motor with split stator windings. The grant of patents to the Candolite Co. and to the Maschinenfabrik Oerlikon for candle lamp-holders and for a system of driving locomotives, boats, &c., respectively, has been opposed. Three patents expire during the current week after a life of fourteen years. They include one for details of the Sprague system of multiple-unit train control, and one

for two-rate meters by the Aron Electricity Meter, Ltd. (Page 192.)

ELECTRIC traction has been inaugurated upon the East London Railway, and we give some particulars of the equipment.—An important decision has been made by the German Patent Office upon the Winter-Eichberg single-phase commutator motor patent. (Page 193.)

We describe the Gott patent for transmission of submarine telegraph cables.—The Automatic Telephone Manufacturing Co. had a very successful year in 1912.—The Attorney-General and the Chancellor of the Exchequer have explained their position to the House of Commons in relation to the purchase of American Marconi shares.—The Committee of experts which the Select Committee appointed to inquire into the various wireless telegraph systems, is to visit Germany to see the Goldschmidt system. (Page 193.)

An ice-making and cold-storage plant is being installed in conjunction with the Chichester electric power station.—A special report has been issued upon the position of the Redditch electricity undertaking, in which it is stated that original mistakes in design are largely responsible for the present unsatisfactory financial position.—The Board of Trade have granted the Truro Corporation an electric lighting provisional Order in preference to the local gas company. (Page 195.)

A 2,000-kw. turbo-alternator and a number of rotary converters are required at Burnley; condensing plant at Darlington; mains and services, &c., at Manchester; a 500-kw. generating set at Peterborough; a 5,000-kw. plant at Fife; E.H.T. switchgear at Salford; meters, arc-lamp carbons at Sydney, and stores at Limerick.—The following expenditures are contemplated on electrical extensions:—Doncaster, £12,500; Chester, £11,550; Londonderry, £13,000; Rochdale, £45,000; and Stalybridge, £22,554. (Page 195.)

## ARRANGEMENTS FOR THE WEEK

### FRIDAY, APRIL 4TH.

*Electro Harmonic Society.*

8 p.m. Smoking Concert at Holborn Restaurant.

*Faraday Society.*

8 p.m. Joint meeting with Manchester Section of Society of Chemical Industry to discuss "The Corrosion of Iron and Steel."

### SATURDAY, APRIL 5TH.

*Finsbury Technical College Old Students' Association.*

6.30 for 7 p.m. Annual dance at Caxton Hall, Westminster.

### TUESDAY, APRIL 8TH.

*Institution of Electrical Engineers: Manchester Section.*

7.30 p.m. Annual meeting at the University.

### WEDNESDAY, APRIL 9TH.

*Institution of Electrical Engineers: Newcastle Section.*

7 p.m. At Literary and Philosophical Society's Rooms, Middlesbrough. "Power Supply on the Rand," by A. E. Hadley.

*Royal Society of Arts.*

8 p.m. "Electric Supply in London," by Frank Bailey.

*Association of Engineers-in-Charge.*

8 p.m. At St. Bride's Institute, Fleet Street, E.C. "Notes on the Design and Economy of Diesel Oil Engines," by Capt. H. Riall Sankey.

### THURSDAY, APRIL 10TH.

*Institution of Electrical Engineers.*

8 p.m. "Self-Synchronising Machines (Self-starting synchronous motors and rotary converters)," by Dr. E. Rosenberg.

*Institution of Electrical Engineers: Dublin Section.*

8 p.m. At Royal College of Science. "Interpoles, their Design and Use," by R. G. Allen.

## The London Electrical Engineers.

(TO-FAY) THURSDAY, APRIL 3RD. C. Company.—Recruit and Company Training, 7 to 10 p.m.

FRIDAY, APRIL 4TH. D. Company.—Company Training, 7 to 10 p.m. F.

SATURDAY, APRIL 5TH. Headquarters open from 10 a.m. till noon.

MONDAY, APRIL 7TH. A. Company.—Recruit and Company Training, 7 to 10 p.m.

TUESDAY, APRIL 8TH. B. Company.—Company Training, 7 to 10 p.m.

THURSDAY, APRIL 10TH. C. Company.—Recruit and Company Training, 7 to 10 p.m.

FRIDAY, APRIL 11TH. D. Company.—Company Training, 7 to 10 p.m.

SATURDAY, APRIL 12TH. Headquarters open from 10 a.m. till noon.

**Tantalum Arc Lamp.**

The current enters and leaves the lamp at A and B, and the fine metal wires glow brightly and give the light.

**Electrical Motor.**

The ring at the top of the machine is for turning the current on or off.

**Alternate Dynamo.**

To increase or decrease the pressure, the brushes B B are moved round the rings A A.

**Hollowphane Shade.**

The lamp is inserted in the hollow portion.

The first of this series of illustrations and its descriptive note is taken from an interesting new publication, "The Parents' Book: a Book which answers Children's Questions." We suggest some similar ones for future editions.

**Radiator.**

The current passes through the spiral wire around the tubes, causing the glass to become hot.

N.B.—It is therefore dangerous to touch these wires.

**Track-Brake.**

The track-brake B is a form frequently employed on electric trains and electric tramcars.

**Wheatstone Bridge.**

A delicate testing device. If the electric wires are laid out to form a lozenge, any slight variation of the current is immediately detected by the instrument called a galvanometer placed in the centre.

**Armoured Cable.**

It will be noticed that there is a strong "armouring" T T, which is made of steel to keep in the high pressure electric current.

## THE INSTITUTION COUNCIL ELECTION

### The Council's Nominations.

ANY nominations which members may desire to make for the Council of the Institution of Electrical Engineers to fill the annual vacancies must be sent in by April 21st, and, in accordance with No. 50 of the new Articles of Association, such nominations must be made by ten members.

The Council's own nominations have now been issued. Mr. W. DUDDLELL, F.R.S., is nominated as PRESIDENT for a second term of office, and the Hon. Sir CHARLES A. PARSONS, K.C.B., F.R.S., and Mr. J. F. C. SNELL are selected to fill the two vacancies as VICE-PRESIDENTS.

Sir C. A. Parsons, K.C.B., F.R.S., is an honorary member of the Institution, and has previously served on the Council. His position in the engineering industry generally as the inventor of the steam turbine, and the influence which this has had upon electricity supply, need be no more than referred to here. Mr. Snell retires from the office of vice-president, but is nominated for re-election. He has also served on the Council previously as an *ex-officio* member when Chairman of the Newcastle local section of the Institution at the time he was chief electrical engineer to the Sunderland Corporation. For several years, however, he has been in London, and is now, as a partner in the firm of Preece, Cardew & Snell, one of the leading consulting electrical engineers.

The Vice-Presidents remaining in office are:—Mr. W. JUDD and Mr. C. H. MERZ.

Mr. Robert HAMMOND is nominated as usual for re-election as Honorary Treasurer.

There is one vacancy in the list of ordinary Members of Council; Mr. A. L. C. FELL and Mr. G. SCOTT RAM are nominated by the Council; and if, as is probable, no other nominations are made by the membership, the ballot will decide which of these two will take office.

Neither have served as ordinary members of Council before. Mr. Fell is Chief Officer of the London County Council's extensive tramway system, and has held many high offices in the tramway associations. Mr. Ram, as Chief Electrical Inspector of Factories to the Home Office, has exerted considerable influence upon the destinies of the industrial applications of electricity in connection with the various rules and regulations now in force.

The members remaining in office are:—Messrs. F. GILL, J. S. HIGHFIELD, H. HIRST, B. M. JENKIN, J. E. KINGSBURY, Dr. A. RUSSELL, Messrs. W. RUTHERFORD, A. H. SEABROOK, Roger T. SMITH, C. P. SPARKS, H. E. WIMPERIS.

As a consequence of the revised Articles of Association which were passed last year, there are for the first time to be three Associate Members and three Associates on the Council. For the three new vacancies for Associate Members, the following have been nominated:—F. E. BERRY, Capt. E. O. HENRICI, R.E., A. W. MARTIN, and S. W. MELSOM, one in excess of the number to be elected. Mr. F. E. Berry, of the British Electric Transformer Co., Ltd., is not quite so well known as his brother, A. F. Berry; Mr. A. W. Martin is one of the Staff Engineers of the General Post Office; and Mr. Melsom is a Senior Assistant in the Physics Department of the National Physical Laboratory.

There are two vacancies as Associates on the Council, for which the Council has put forward three names:—Mr. E. CLARKE RUSSELL (the well-known barrister, who has appeared in many electrical law suits; he has already filled a similar position), Mr. FRANCIS INCE (a Governor of the Syndicate of Electrical Engineers, Ltd., proprietors of Faraday House), and Mr. A. M. J. OGILVIE C.B. (Third Secretary to the General Post Office). Neither of the latter have served before. Mr. A. B. ANDERSON remains in office.

In addition the Chairman and immediate Past Chairmen of each of the Local Sections are *ex officio* Members of Council.

## THE CONVENTION OF THE MUNICIPAL ELECTRICAL ASSOCIATION

THE preliminary programme of the eighteenth annual convention of the Incorporated Municipal Electrical Association, to be held in London on June 17th to 21st, has now been issued. At the opening meeting (in the theatre of the Institution of Electrical Engineers), a paper will be read, after the address of Mr. Shawfield (ex-president), by Dr. S. Z. de Ferranti, on "Prime Movers." In the afternoon visits have been arranged to the electricity works of the West Ham Corporation and the London Electric Supply

Corporation at Deptford. The subject for discussion at Wednesday's meeting is not yet announced, but the afternoon visit will be to the Lots Road power station of the London Electric Railways, and the Annual Dinner will be held in the evening. Thursday will be spent at Kingston-upon-Thames, where a paper will be read by Messrs. A. H. Seabrook, W. Watson and R. J. Mitchell on "Electric Vehicles," and one by Mr. J. Christie on "Air Filtration." For the afternoon a river trip is planned. Friday will be devoted to the Annual General Meeting and a Special Meeting to consider the revision of the Articles of Association. It is hoped that it may be possible to arrange for a visit to the Metropolitan Water Board's new gas-pumping plant at Chingford on the Saturday. The official headquarters of the Association will be at the Hotel Cecil.

## POWER SUPPLY ON THE RAND

MR. A. E. HADLEY'S Paper on this subject (ELECTRICAL ENGINEERING, March 20th, page 159) was discussed at Manchester on March 11th.

Dr. E. ROSENBERG (British Westinghouse Co.) commented on the very high power-factor of the Rand undertaking.

Mr. B. WELBOURN (British Insulated & Helsby Cables) referred to cable trouble due to white ants and surface subsidence. It had been found that expansion joints overcame this latter trouble. He thought that the accumulation of dust in sand storms would have the effect of altering the distribution of potential over the suspension insulators, so that individual discs might be overtaxed. It appeared to him that any form of arrester that involved a spark was distinctly a thing to avoid, for sparking at such high frequency was simply lightning discharges artificially produced, and would seem to introduce into the system the very thing it was necessary to avoid.

Mr. G. D. SEATON and Mr. LAMB also spoke, and Mr. J. LUSTGARTEN (Manchester Municipal School of Technology) asked if during the period of lightning any insulators had been punctured. Regarding earthing of neutrals, while in L.T. distribution earthing was the best policy, on H.T. circuits opinion was against earthing the neutral. Recent American practice had been to work with a non-earthed neutral and to use an arc suppressor.

Mr. COATES asked if the switches in the sub-stations were of similar breaking capacity to those in the main stations, and also if, since the earthing of the neutral, there had been any less difficulty in breaking the load on the switches.

Mr. PARRY remarked that the newer power-stations had been put down at the place where the power was required, and the coal taken to them; and asked whether there was any reason why they should not have been put down at the collieries and the power distributed from these.

Mr. W. BOLTON SHAW also spoke.

Mr. HADLEY, in reply, said they had not had any trouble on the cables through white ants, subsidence, nor from dust on the suspension insulators. Regarding the puncturing of insulators, in the ordinary way where they had induced discharges, they had punctured generally in the places where the glaze had been rubbed off, and water had worked its way in.

**Stearn Lamps.**—The Stearn Electric Lamp Co., Ltd. (47 Victoria Street, S.W.), inform us that, owing to the trade name "Globolite" having been already adopted for another electrical device, they have changed the name of the lamp described on page 150 of ELECTRICAL ENGINEERING of March 13th, to the "Softlite" lamp.

**American Hydro-electric Schemes.**—The New York State recently proposed a very extensive hydro-electric scheme with high-pressure transmission, under State ownership and management, similar to that now in operation in Ontario. A joint Legislative Committee appointed to investigate the water-power resources, according to the *Electrical World* (New York), finds that there is only 1,196,800 undeveloped water h.p. available within the State, of which only 262,700 h.p. is owned by the State, whereas 3,000,000 h.p. is actually required. The committee also finds that, according to economic and business standards, the Ontario scheme is not a success. Electrical energy is furnished to the municipalities below cost, the actual annual loss being about £90,000. It is also claimed that the municipal system of Toronto showed a net loss to June 30th, 1912, of about £56,000. Several bills have, however, been introduced in the New York State Legislature. It is provided that the initial cost shall not exceed about £125,000, the plant to develop 12,000 h.p. The charges are to be such as to pay off the debt in 50 years. The Bills are not altogether favourably received, as the transmission lines to New York would be about 171 miles long, and it is pointed out that the city of Buffalo, served over eight independent lines, which can be connected together in any way, does not obtain absolutely continuous service, notwithstanding that the lines are only 25 miles in length.

## PETROL ELECTRIC CARS FOR LIGHT RAILWAYS

A PAPER entitled "Self-Propelled Cars for Light Railways," by Mr. J. P. Tierney, was read before the Dublin Local Section of the Institution of Electrical Engineers a short time ago. The author first gave a few notes on steam motor-cars and on direct petrol-cars, mentioning in the latter case the petrol tramcars at Morecambe and a remarkable American car with a special design of body, described as similar to a racing yacht turned upside down with the front end wedge-shaped. Tests had shown, he said, that at high speeds a car with a plain front end consumed 40 per cent. more power than a wedge-fronted car. He next described the car in use on the Central South African railways, equipped with the Thomas transmission gear, where the power is transmitted from the petrol engine to the wheels partly electrically and partly mechanically (see *ELECTRICAL ENGINEERING*, Vol. VIII., p. 627, Nov. 7th, 1912, and Vol. VII., p. 236, May 4th, 1911). He also gave a few particulars of the accumulator rail-cars used to some extent on the Prussian railways and the Beach tramcar in America, equipped with the Edison battery. The greater part of the paper was, however, devoted to pure petrol-electric cars for use on railways, and descriptions were given of the Westinghouse pattern in use on the Great Central Railway (see *ELECTRICAL ENGINEERING*, Vol. VIII., p. 187, April 11th, 1912) and on the Continent. He claimed great advantages over the steam car in point of cleanliness, absence of boiler, ease of control, necessity for only one driver, economy in upkeep and standing charges, readiness for use, and the possibility of exerting full horse power at low speeds. Over the geared petrol car also it had the last-mentioned advantages, as well as that of smoother acceleration. A description was also given of the petrol-electric system of the A.E.G., in which the engine is mounted on one bogie clear of the body. Other cars were referred to made in America by the General Electric Co. and the Strang Gas Electric Car Co., which have also been fully described in the technical Press from time to time, and also the well-known Pieper "Automixte" system. In conclusion the author described a car that he had designed for the purpose of

running over the lines of the Dublin United Tramways Company and the Dublin and Blessington Company, which is at present operated by steam locomotives.

The car measured 40 ft. overall over the buffers, the body was of the centre-entrance type, the entrance for passengers being not exactly in the centre, but placed at a point one-third of the total length of the car from one end. At this entrance a doorway to the right led into the passenger compartment and a door to the left into a special compartment containing the plant. Also to the left was a straight incline staircase leading to the top deck. By this means space was economised and it was possible to get the plant partly under the staircase. At each end of the car was a driver's compartment, with the necessary control apparatus. The passenger compartment, which seated thirty-six passengers, was divided into two classes, first and third; the top deck seated sixty-nine, leaving a total seating capacity of 105 passengers. One bogie truck was equipped with two 54-h.p. motors capable of propelling the car with a 10-ton trailer at a speed of twenty-five miles per hour on the level and a speed of from six to eight miles per hour on a grade of 1 in 25. On the Blessington line, for a distance of three miles the grade averages 1 in 35, which in one place is as steep as 1 in 20.

The power plant consisted of a 100-h.p. petrol engine driving a 65-kw. direct-current compound-wound interpole dynamo. In addition there was a small petrol engine driving a vacuum exhaustor for the vacuum brakes and a small lighting generator for lighting the car. The engine was water-cooled, radiators being provided on the roof in front at one end, in the position usually occupied by the destination indicators. The car was also fitted with an ordinary trolley for running on the city lines. The control would be duplicate, the ordinary series-parallel controller for operating on the trolley section, and a controller on the shunt field of the dynamo for operating on the petrol set.

Mr. Harriss, in the discussion, expressed the opinion that the mechano-electric combination was not a permanent one, but that the various systems would ultimately resolve into purely electrical or purely mechanical one, whichever ultimately became perfected. Mr. Sandford stated that the Thomas transmission system claimed an efficiency of 96 per cent., as compared with 60 per cent. on a pure petrol-electric system. Since the car referred to in the Paper had been put into regular operation, two trailers had been added, the chief result being to improve the fuel consumption per passenger-mile. Mr. Eaton said that the employment of the Edison storage battery had greatly reduced the objection to battery systems. It stood vibration and shocks very well. The efficiency, although not so good at the outset as that of lead batteries, improved with use, while with the lead battery this was very much the reverse. Mr. Tatlow drew attention to the wide variations in voltage and current from the machines on the Westinghouse system. He supposed that the use of intervals had made such fluctuations possible.

Mr. Tierney, in reply, said that in South Africa, using the Thomas transmission system, and with petrol at 1s. 6d. per gallon, the costs worked out at 4d. per car-mile. They hoped by the use of paraffin to reduce the cost to 1½d. per car-mile. He did not advocate a petrol-electric system in favour of a purely electrical one where the latter could be obtained, especially on account of the very superior acceleration obtainable with electric cars.

**Osram and Robertson Staff Dinner.**—The Annual Staff Dinner of the Osram and Robertson Lamp Works was held on Friday evening last at the Clarendon Restaurant (Hammersmith), and proved to be as pleasant a function as any which have preceded it. As soon as the dinner had been partaken of, a long and varied musical programme, ably organised and carried out by members of the staffs of the associated Works, was enjoyed by the guests. As usual, the toast list was kept short. The announcement of most interest was made by the Chairman, Mr. C. Wilson (General Manager, Osram and Robertson Lamp Works). After reminding the audience that it is now 21 years since the Robertson Works was first started, that the number of employees was now about 1,700, and that when the extensions now in progress were completed the number would be increased to 2,000, he said that he had been authorised by the Directors to state that they had decided to found a Staff Club. For this purpose the premises known as Poplar House (Brook Green, Hammersmith) had been purchased. The management would be vested in a Staff Committee. Mr. Samuelson (Solicitor to the G.E.C.), who was present, then intimated that he would be pleased to act as Honorary Solicitor for the new Club. The other speeches brought out the spirit of co-operation existing between the Management and Staff, which is responsible in a large measure for the success these Works have attained. The arrangements for the function were in the capable hands of Mr. A. S. Gosling (Confidential Assistant to the General Manager).

## ELECTRICAL ENGINEERING IN THE MINING AND METAL INDUSTRIES

### EXPLOSION PROOF MOTORS

THE results of an investigation into the properties of different kinds of explosion-proof motors have been recently published by the United States Bureau of Mines. In carrying out the tests the motor was placed in an explosive mixture of mine-gas—or methane—and air, and by setting the valves in the piping system so that the circulating fan took the mixture from the motor casing only, it was possible to determine quickly and accurately when the motor casing was filled with the desired mixture. This test was made by means of an apparatus in which a small quantity of the mixture was burned in close proximity to a thermo-couple connected to a delicate millivoltmeter.

The motors tested had relief valves to relieve the pressure caused by internal explosions. Five types of protection were tested. Type *a* consisted of three layers of gauze protected by a poppet valve; type *b*, two unprotected layers of gauze having an exposed area of approximately 4 in. by 5½ in.; type *c*, five brass baffle plates; type *d*, two sets of plates, one set at each end of the motor casing; and type *e*, two sets of gauze and baffle plates, one set being at each side of the motor casing at the commutator end. On type *a* 191 tests were made under forty-five different conditions. Flames, varying from 2 in. to 4 in. in length, were discharged through the protective devices in almost every test. They lasted only a fraction of a second and varied in colour from pale blue to bright red. The safety of a motor protected in this manner appears, says Mr. H. H. Clark, the author of the report, to depend upon the efficient dissipation of heat in the gases surrounding the motor, instead of upon the removal of heat from the escaping gas by the protective devices. It would seem that, even when no puncture occurs, the escaping gases fail to ignite the surrounding mixture by only a small margin. The poppet probably assists in cooling the escaping gases, and it also serves to equalise the pressure on each side of the gauzes, and so prevents their being torn from their fastenings. Since explosions occurred with poppets open, with poppets closed, with 8·6 per cent. of gas (taken as the most explosive mixture), with "overgas" and "undergas," with low pressure (12·5 lb. per sq. in.) and with high pressure (30·5 lb. per sq. in.), it is not possible to define exactly what is the explosive condition in this case. Practically no tests were made on types *b* and *c*, as it was seen from the results of the tests on type *a* that they were doomed to failure, but 236 tests under twenty-five different conditions were made with type *d*. A fan was mounted on the armature shaft so as to cause a considerable circulation of air through the motor casing. Flames 4 in. to 6 in. long were observed only when the fan was in use. The duration of the flames was short, and the surrounding gases were not ignited. This may also have been due to the first gases discharged being cooled by the plates below the ignition temperature of the methane, and driving away the gases immediately surrounding the relief openings. It is pointed out that the value of this form of protection may be entirely destroyed by separating the plates by a very small amount, and if the motor were designed to work without a fan, "after-burning" sufficient to destroy the insulation would take place if the rotation of the armature should produce a circulation of gas through the casing, so that, as fast as it was drawn in, it was burned at the inner edges of the plates. The failure of this type was due, says Mr. Clark, more to the extremely severe conditions imposed by the motor design than to imperfections in the design of the devices themselves. With the type *c* device 268 tests were made under twenty-six different conditions. In no tests were any flames observed, but when coal dust was sifted into the devices it was driven out in a cloud, and the explosion seemed to start from a point within this cloud. This probably indicates that the dust was raised to its ignition temperature before it left the casing of the motor, and upon reaching the outer air burst into flame and ignited the gaseous mixture surrounding it. The pressure developed in the motor casing in the test in which there was a "puncture" was less than 40 per cent. of the average maximum pressures produced in ten

other tests made with gas alone, in which no "puncture" took place. It appears, therefore, that when coal dust is present type *c* devices do not afford the protection which they are designed to give.

In conclusion it is pointed out that the motor casings should have the minimum number of openings and the amount of unoccupied space within should be as little as possible, and the total area of protected openings should be a maximum and should use as much metal as possible. By this means the maximum pressure is decreased, whereby the flame temperature is lower. Use may be made of the fact that the advancing edge of the explosive wave is the most likely to be chilled, because it passes through the coolest metal. If, then, this relatively cool dead gas is passed through a comparatively long passage, like that between the baffle plates of the type *c* devices, subsequent flames will be cloaked with non-combustible gas and can cause no ignition. It is suggested that a very suitable place for the protective devices would be entirely within the motor casing, with vent holes for the escaping gases.

### MINERS' ELECTRIC LAMPS

A LECTURE under this title was delivered at University College, Nottingham, on March 15th, by Mr. W. Maurice, of Hucknall Torkard (Past-President of the Association of Mining Electrical Engineers). The lecture was arranged under the auspices of the Midland branch of the National Association of Colliery Managers and the Notts Education Committee. Mr. H. R. Watson (President of the Midland branch of the National Association of Colliery Managers) presided over a large number of colliery managers, mine deputies, mining students and miners. The lecturer first outlined the introduction of the earlier types of electric lamps. The first attempt ever made to adapt the incandescent lamp to mine illumination dated from 1881, when Mr. (afterwards Sir) J. W. Swan devised a lamp for this purpose, which was first used in a Nottinghamshire colliery. On December 12th, 1885, Mr. Swan exhibited the first portable electric lamp before the North of England Institute. The electric lamp, said Mr. Maurice, was destined to promote the welfare of the miner and the industry generally in far-reaching and, perhaps, not yet wholly recognised ways. The principal features of the different types of lamps were touched on, as well as the organisation of electric-lamp installations for mines, and the management of electric-lamp cabins, and gas-testing appliances. In conclusion he expressed the belief that the flame lamp was destined to rapid and complete disappearance, and that the working faces and every centre of activity in all important mines would, within the next few years, become as brilliantly illuminated as the best-lighted pit-bottom. Light in the mine was not a luxury: it was an urgent and far-too-long-delayed necessity. If only one point of justification were needed for making so important a change in underground conditions, it was surely to be found in the remarkable increase in the number of cases of nystagmus. It had been shown that 25 per cent. of all underground workers had latent nystagmus, and from 0·05 to 2 per cent. the ordinary form of the disease. Dr. Court had found that 34·75 per cent. of all coal-cutters were affected, and nearly 95 per cent. of the total number of cases occurred among this class of worker.

In moving a vote of thanks to the lecturer, Mr. F. A. Frazer (H.M. Inspector of Mines) said that Dr. Court's contention that nystagmus was due to insufficient light was a rather debatable point, for there was a colliery in Derbyshire—a naked-light pit—at which there more cases of nystagmus than at safety-lamp pits.

**Electric Miners' Lamps.**—According to the *Colliery Guardian*, over 2,000 electric lamps have been obtained by the Brodsworth Main Colliery Company to replace ordinary oil lamps. A new electric lamp station is now in course of erection, near the old lamp cabin. Already about 100 electric lamps are in general use, and are stated to give every satisfaction.

## A FLAME PROOF MINES TELEPHONE

THE telephone should be one of the most useful pieces of electrical apparatus in mines, yet in this country its introduction for this purpose has been very slow. This may only have been due to conservatism of mine managers, but it is conceivable that there has also been the feeling that the telephone might be a source of danger underground; the mining engineer would obviously look askance at a box in which gas might accumulate and the possibility of sparking within that box. Whether this objection is a valid one or not, it is surprising that it has not been met long ago by makers of telephone apparatus, and we are therefore very pleased to learn that the Western Electric Co., Ltd. (North Woolwich, E.), has taken up the point and has placed upon

FIG. 1.—TELEPHONE SET CLOSED.

FIG. 2.—TELEPHONE SET OPEN.

the market a telephone designed on the same lines as other electrical apparatus in mines, and absolutely removing any risk.

The "gas-tight" construction hitherto adopted by most telephone manufacturers must be difficult to keep effective. For this construction glands have to be employed, through which such moving parts as the generator handle, the switch-hook and the receiver tubes or wires have to project, and there has to be yet another gas-tight joint to enable the instru-

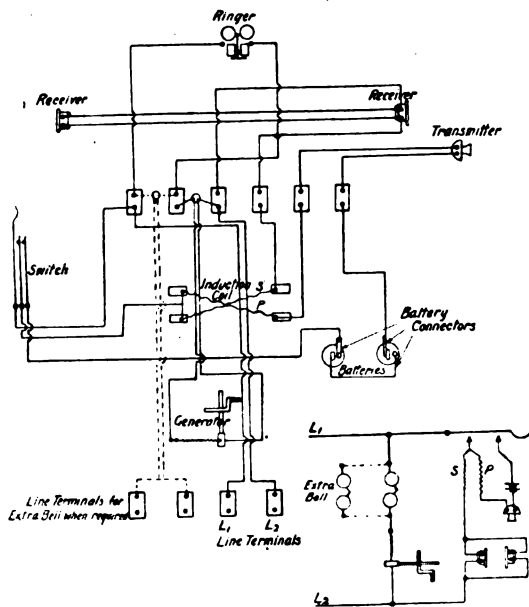

FIG. 3.—DIAGRAM OF CONNECTIONS.

ment to be inspected. That the packing at all these joints would deteriorate in time is a foregone conclusion. The Western Electric Co., in their set illustrated in Figs. 1 and 2, have removed the difficulty entirely by adopting a rational "flame-proof" construction.

The details of the instrument, we are informed, have been worked out after consultation with many experienced mining engineers. It is a local battery magneto set, in which all the apparatus is enclosed in a heavy cast-iron case, and a flame-

proof or explosion-proof flange is provided to render the presence of gas in the set innocuous. If any explosion occurs, the resulting flame, in passing through the flange, will be cooled down sufficiently to render it harmless. The chief feature of the set is the provision of this flame-proof flange, which consists of a wide machined flange running all round the edge of the case, suitably drilled and tapped to accommodate the bolts which secure the cover. Similarly, every spindle or tube extending through the walls of the case is arranged with a suitable cooling surface, with the exception of the leads, which are sealed in a gland.

In a telephone used in mines, it is even more important to provide means for preventing the moisture, due to condensation within the case, from doing damage than to attempt to render the case absolutely water- and moisture-proof. This is accomplished in this instance by mounting the apparatus on special frames or shelves, and providing suitable bosses and ribs on the walls of the case so that all condensed water can flow to the bottom. There is 4-in. clearance there where the water can collect harmlessly, and a drain plug is provided for drawing it off periodically.

The mouthpiece of the transmitter is cast on the front cover of the set, a perforated protective steel grid is provided over the opening, and the diaphragm is protected from moisture by

FIG. 4.—VIEW OF PART OF CASE, SHOWING SWITCH WORKED BY RECEIVER ARM.

a celluloid shield. The two receivers are mounted on rotary arms provided with short hinged acoustic tubes and earpieces. These actuate contacts, taking the place of the usual switch-hook for connecting up the microphone circuit when the instrument is in use.

The internal arrangements are such that there is very little space over in which gas can accumulate, and as a further precaution the generator is permanently bridged across the circuit in series with the bell, and has not the short-circuiting contacts at which sparking frequently occurs in ordinary magneto-telephones. A diagram of connections is given in Fig. 3. An interesting detail is that the cover is secured by brass bolts which are surrounded by annular bosses, so that the set can only be opened with the special box-spanner provided for the purpose. Cast-iron covers are provided for the gongs and terminals, and the gong cover also carries a drip plate which protects the top joint of the set. The coils of the receivers, generator, bell and induction coil are all impregnated with a moisture-proof compound.

The gongs are carried on separate posts mounted outside the set, and are eccentrically drilled to provide a means of adjustment; the clapper rod is carried in a separate brass liner, which is screwed into the case, and is provided with the necessary flanges for the explosion-proof feature.

There are special German silver connectors for the cells of the transmitter circuit, so arranged that it is only possible to connect the cells in the correct way.

In fact, every small detail has been thoroughly thought out, and particular care has been taken to render inspection and the replacement of parts as easy and simple as possible.

## THE OLDHAM EMERGENCY ELECTRIC LAMP

THE Oldham Emergency Electric Lamp has been approved by the Home Office for use in mines. According to the official description, this lamp, which is of the bull's-eye type, as shown in the figure, possesses the following general features: (1) A cast aluminium case, with a cover secured by a lead rivet lock. (2) An electrical accumulator, so constructed as to prevent escape of the liquid, whatever the position of the lamp, whilst allowing the escape of gas generated by chemical action in the accumulator. (3) A flame-tight screwed plug of vulcanite, or other suitable material, enclosing the contact made between the insulated lead and the positive terminal of the cell. (4) A switch contained in a flame-tight enclosure, the cover of which, with its washer, is secured by screws. The screw heads are pierced so that a wire may be threaded through, and the ends sealed with lead seals. (5) A bulb and reflector contained in a second enclosure, which communicates with the switch enclosure. It is made flame-tight by means of a screwed ring containing the lens, and a washer. The ring is prevented from unscrewing by means of a clip secured by screws, the

With bull's-eye glass. With well glass.  
OLDHAM ELECTRIC LAMP, ONE-QUARTER FULL SIZE.

heads of which are pierced as in the case of the switch-cover screws. The lens may be of either of the types shown in the drawing, or of other types if not inferior in strength.

The lamp is approved for use under the following conditions: Provided (1) That the total weight of the lamp is not more than 4lb. 8 oz. (2) That the strength of material and attachments throughout the lamp is not less than in the sample submitted to test on the 30th October, 1912. (3) That the lamp is capable of maintaining a light of not less than 1.5 c.p. throughout a period of not less than ten hours. (4) That the lamp shall be used only for work of rescue or exploration in the case of an accident or other emergency or by officials. (5) That the lamp has been made at the works of Messrs. Oldham and Son, at Denton, near Manchester. (6) That the lamp shall have marked upon it its name and the name of the maker.

## ELECTRICITY IN METAL MINING

SOME particulars of the uses of electricity for precious metal mining in Colorado are given by a writer in the *Electrical World* (New York). A pressure of 440 volts alternation is standard in all districts, and the motors are squirrel-cage slip-ring induction motors with external rotor resistance. In most mines an eight-hour shift from 7 a.m. to 4 p.m. is worked. The maximum hoist speed is about 500 ft. per minute, and 15 h.p. per bucket ton is ordinarily installed. The demand usually approximates 1.5 kw.-hour per 1,000 ft. per ton in vertical shafts. Mostly the charges are based on the motor rating plus the energy consumption. Most of the drills are driven by compressed air. The compressor motor usually consists of 10 h.p. per 2½-in. drill, requiring about 100 cub. ft. of air per minute at 100 lbs. pressure. The charge, if not included in the total charge based on readiness to serve plus energy metered, is sometimes rendered on a flat-rate basis of about 40 kw.-hour per drill. Energy for motor-driven pumps and fans is usually sold on a flat-rate. It is usual to instal 8 h.p. per 100 gallons on a 100-ft. head. Dealing with mills, the writer states that no approximate rule can be given for the size of motor for crusher service. In one large mill a 9-in. by 5-in. crusher for tungsten ore is driven by a 15-h.p. motor and handles

40 tons in from six to eight hours, grinding it to 2-in. mesh. Usually crushing and grinding loads are combined on a single motor through a short line shaft. Where the grinding is divided among a number of machines and storage is provided between steps, the crusher and grinding load becomes a desirable one. Rolls are operated in pairs, each being usually belt-driven with spring compression. One mill with an eight-hour crushing, grinding, trommelling and elevator load of 300 tons is driven by a 100-h.p. motor belted to a line shaft. The speed of stamps ranges from 80 r.p.m. to 100 r.p.m., and the travel from 3 in. to 12 in. In one mill with five-stamp batteries, running at 90 r.p.m. and with 6-in. strokes, the demand is 25 h.p. The power demand at about 240 r.p.m. of Wilfrey and Card tables is about 2 h.p., of Monnell slimers about 1 h.p., and vanners slightly less. For ordinary sizes of jigs, speeds and amplitude of the piston throw, the demand ranges from 2 h.p. to 7 h.p. per jig. Trommels are usually belt-driven from shafts to which are also connected crushers and rolls or jigs and mills. The power requirements vary with the speed, which is limited to a range of from 30 r.p.m. to 60 r.p.m. From 1 h.p. to 1.5 h.p. is required in a slowly driven 3-ft. by 5-ft. trommel, and from 3 h.p. to 4 h.p. is the average demand of a 5-ft. by 9-ft. trommel. Conveyor loads are not large and the practice is to drive the conveyors from a short line shaft, which also drives the machines with which they are associated. Electrolysis is employed to some extent in connection with the recovery of metals from cyanide solutions. In the Ajax mill at Cripple Creek a 20-h.p. motor is belted to a 10 volt, 1,500 ampere generator. Energy from this is fed to baskets having 4 in. by 4 ft. cylindrical graphite anodes, the surrounding iron forming the cathode, and the baskets are sunk in the weak chemical solution of the agitators to hasten the chemical separation of the metals from the compounds in the ore slimes. Electrolytic methods are also employed in the zinc press treatment for recovering metals from cyanide solutions. Instead of forming zinc compounds and continuously wasting the zinc, the gold-bearing solution is passed between plates spaced so that, with proper flow, the ion travel will theoretically cause all of the gold to be deposited on the iron cathode, whence it may be removed as a precipitate. In the Davis precipitator a semi-circular tank 3 ft. in diameter by 12 ft. long is used to hasten the process. The solution in flowing through the precipitator is intercepted by twenty-four revolving perforated steel discs connected as cathodes. Anodes consisting of numerous ¼-in. graphite rods are hung in the solution between the discs.

Electrical drying and melting of ores is being introduced. The drying is effected in brick furnaces on metal plates, under which heater coils are placed. It is necessary to make very low rates for this class of work to compete with steam. From 10 kw. to 25 kw. is required to dry from 15 tons to 30 tons of tungsten per month. Arc furnaces are occasionally used to melt gold and silver from their precipitates. Oil-burning tilting furnaces are in more common use.

**Notts and Derby Branch of the Association of Mining Electrical Engineers.**—At a meeting on Saturday last, Mr. E. K. Scott's Paper on shaft cables was discussed. A special meeting of this branch is to be held at Chesterfield next month.

**Electrical Mining Accidents.**—The death of a boy of 14 named B. Bettridge is reported at Langwith Colliery on March 5th, due to electric shock. The deceased, who was a pony driver, was leaning against a prop to which a lamp was attached, and appears to have touched the lampholder, which by some means had become live, and to have drawn it out of place when falling. The evidence brought out the fact that the lamp was one of a series of four 110-volt lamps on a 440-volt circuit, and the electrician to the mine, thinking that they were on a 110-volt circuit, had omitted to earth the holders. All such lamps in the pit have since had their holders earthed.

Another fatality occurred on March 6th at Houghton Main Colliery, when John Bain was killed by a shock while working on an electric coal-cutter. After telling his mate to switch on, the deceased took hold of the handle of the machine and received a fatal shock, although he had rubber gloves on at the time. Two other men received shocks in endeavouring to switch off. Mr. R. Nelson (H.M. Electrical Inspector of Mines) expressed the view that the voltage at which the coal-cutter was worked (650 volts) was higher than was necessary, and that the earth connection, which had too many joints, was of too high a resistance to be effective. With 200 volts the danger would be practically non-existent, even with the existing earth connection. He deprecated the use of rubber gloves, and said that apparatus which required them was obsolete for mining work.

## ELECTRICAL MINING AND METALLURGICAL PATENTS OF MARCH

### Mining.

The following are the patent Specifications of particular interest to mining electrical engineers published during March: No. 4,983/12, by C. H. Worsnop, covers the use of a glass cylinder surrounding the bulb of a miner's safety lamp and a lens forming the top, bottom or front, as the case may require, so that the lamp may be used as a searchlight as well as giving a light all round. In specification No. 5,170/12, by H. F. Joel, is described an improved mechanical construction of the lamp casing, particularly applicable where contact is made within the case, as described in specification No. 4,019/11, by the same inventor (*ELECTRICAL ENGINEERING—MINING SECTION*, Vol. VIII., p. xxvi., April 4th, 1912). In one form the lamp is made in four parts: a cylindrical stamped or spun metal battery case, having a male screwed ring on the outside top edge, a detachable cover plate on the lid over this case for carrying the lamp on the top, a lantern cage with a protecting glass cylinder having a flanged end on its base, and a female-screwed flanged nut turning on the flanged edge of the lantern which, when screwed to the top of the battery case, fastens the lantern tightly to it and also secures the cover and lamp in place. The top, side bars and flanged edge of the lantern cage are all made in one piece. A set pin or screw ensures that all the parts are placed accurately and prevents the lantern turning when the nut is being screwed down. Arrangements are also made so that the battery must be in its correct position. It will be seen that by the one operation described the lantern is made airtight and the contacts brought into position. The case is locked by a pin or lead lock in an approved manner. Alternative constructions embodying slight modifications are given.

Fig. 1.

Fig. 2.

TWO DESIGNS OF SAFETY LAMP.

The illustrations, Figs. 1 and 2, show the construction of two designs of the lamp.

A catalytic detector for inflammable gases is described by A. Guasco (Paris) in specification No. 3,628/12. Two closed chambers are arranged within an insulating case provided with one porous wall, e.g., asbestos, which permits of endosmose (the inflammable gases can pass through more readily than can the air), so that normally the chambers are at the same temperature and in perfect equilibrium. One of the chambers is made of glass or bare metal and the other carries fragments of a catalytic metal or alloy. They are connected by a U-tube containing a liquid which normally stands at the same height in each limb, but the presence of inflammable gases in the air causes the catalytic chamber to be heated and so the air expands and acts on the liquid, which may close warning or indicating circuits. Alternately the two closed chambers may be made by dividing one chamber by a thin diaphragm, which is acted on by excess of pressure and so closes the electric circuit.

Watertight bells are described in specification No. 19,587/12, by E. A. Graham. The contacts of the interrupter are en-

closed in the same casing as the electromagnet, and they are separated through the action of a diaphragm due to an impact received by a lever from the hinged lever or its equivalent when the magnet is energised. By this means the diaphragm is relieved of strain except when the bell is ringing, and the contacts are capable of fine adjustment.

For blasting drilled rocks, coal seams, &c., F. Kessler and F. Berger (Germany) propose, in specification No. 30,110/12, a watertight, hollow cylindrical casing with a longitudinal slot to admit the explosive cartridges, which are electrically ignited. Water is contained in the casing to neutralise any flames.

The following pocket device for mining officials has been patented by G. Watts, specification No. 5,845/12. A knife blade, a pricker for preparing cartridges to receive detonators, a shotfiring battery key, a manhole doorway, an electric lighter key and a safety-lamp key are all arranged like an ordinary pocket-knife.

### Metallurgical.

There were two specifications having a particular bearing on electricity in the metallurgical industry published during March. No. 16,041/12, by J. Bally, describes an improved retort furnace in which the heat is produced by currents set up by a rotary inductor. Fig. 3 shows an outline of the

FIG. 3.—ELEVATION AND PLAN OF INDUCTION FURNACE.

furnace, as given in the specification. Vertical retorts, *R*, are arranged in a circle round the revolving inductor, *I*. They are embedded in refractory material and are connected in series by the upper and lower covers, *C*, one to each pair of retorts. The upper and lower cover sections are staggered, as shown in the figure. The magnetic frame, *MF*, is cut away to receive the retorts and is carried by braces, such as the sleeves, *S*, threaded in the vertical bolts, *VB*. If no advantage is to be taken of the heat produced by eddy currents in the magnetic frame, this may be cooled as indicated in Fig. 3. Modifications in the arrangements for special purposes may also be made, and by arranging the retorts in concentric circles heat gradations are possible.

The other specification is No. 10,882/12, by H. Plauson (Russia) and G. Tistschenko (Russia), describing a method for the production of tough ductile iron by electrolysis. Three methods are given of preparing simple mixtures of ferrous and conducting salts, which, at temperatures between 30° C. and 70° C., yield tough electrolytic iron if the solution is kept acid.

**South Wales Branch of the Association of Mining Electrical Engineers.**—The annual meeting and dinner will be held during the present year at Cardiff some time in May next. Preceding the meeting a cinematographic lecture will be delivered by a technical expert, and the subject of the lecture will detail the manufacture of electric cables. Full particulars will be issued in due course, and any further information can be obtained by application to the hon. secretary, Mr. G. Humphry, Victoria Avenue, Cardiff.

## ELECTRIC HEATING AND COOKING

A DISCUSSION on electric heating and cooking was opened by Mr. T. Roles at a meeting of the Yorkshire Local Section of the Institution of Electrical Engineers on March 12th, at Leeds. In his remarks on heating and cooking generally, he mentioned that over 1,000 kw. of such apparatus was known to be connected up at Bradford, not including the small appliances run from ordinary plugs. Owing to the continually improving designs of apparatus, a hiring scheme had not yet been introduced. The charge was 15 per cent. of the rateable value per annum plus  $\frac{1}{4}$ d. per unit, with no meter rent. Dealing more in detail with heating apparatus, he distinguished between radiators and convectors, preferring the former, where the heater is only required for intermittent use or to provide warmth immediately, and the latter to warm the whole room in the shortest possible time and to maintain the warmth afterwards. The consumption of the heater should be not less than one watt per cubic foot of the room to be heated. Radiators were sometimes designed so that lamps were more or less hidden at the top, bottom or sides by some portion of the body, but this tended to overheating of the lamps and shortening of their life. A fault of convectors was often that the air inlets were not nearly large enough. He described various well-known types of heater, including the Bastian, Ferranti, and other glowing-quartz patterns. Passing on to electric cooking, he referred to the deserved popularity of the "Tricity" cooker, but spoke of minor but annoying troubles with the flexibles and plug connections used. Manufacturers generally had not yet settled down to standard lines, and they did not seem to have studied sufficiently the requirements of the various classes of people for whom they have to cater. In different parts of the country the conditions were very different. In Bradford cookers should be of sufficient size to bake bread, and should have a larger proportion of bottom heat than is required in the south of England. The following were some of the requirements which were indicated by his experience. The ovens should be provided with at least three separate sets of heating elements, so controlled that not less than three regulations are provided. It would appear an advantage if ovens were constructed so that a glowing type of unit can be used for the cooking of meat, and controlled by a series-parallel arrangement so that the heat in each individual element can be reduced when bread or pastry is being baked. It is generally found that two hot-plates and one grill mounted above the oven are sufficient for all ordinary purposes, but in the case of an oven suitable for large families it might be advisable for three hot-plates to be fitted. A flat plate of not smaller dimensions than 36 in. by 18 in. should be fitted at the top of the oven, level with the base of the hot-plates, so that cooking utensils, dishes, plates, &c., may be stood thereon. It is advisable that this plate should not be painted or blackened, but should be left bright and kept clean. The space between the underside of the top plate and the oven should be utilised partly as a hot cupboard for warming dishes, plates, &c., and partly as a grill, the grill elements being fixed to the underside of the plate. The whole of the heating units above described should be separately switched and fused. Porcelain vessels even with specially ground bottoms were not very satisfactory for cooking on hot-plates on account of their poor thermal conductivity and uneven thickness. Thin, stamped, metal utensils were better, but the best results were obtainable with stiffly constructed vessels, such as those made of cast-iron or cast-aluminium, having machine-ground or turned bottom surfaces of fair thickness. Excellent contact was made by such vessels with the turned surface of the hot-plate, which contact, owing to the vessels' rigid construction, was not broken by buckling. In addition to this, due to the thickness of the metal in the base of the utensil, the heat, even if absorbed unequally over its under-surface, was equalised by the rapid conduction which takes place in the metal itself before reaching the surface exposed to the liquid.

Mr. H. Churton (Leeds), in opening the discussion, expressed the view that both Canada and the United States were ahead of us in the manufacture and use of electric heating and cooking apparatus. He thought that the price charged in Leeds for current for heating and cooking was too high. Cleanliness was an important factor in favour of electric cooking.

Mr. W. B. Woodhouse (Engineer-in-Chief, Yorkshire Electric Power Co.) mentioned the case of a friend who has everything possible done by electricity in his house, the annual consumption

being 100,000 units at  $\frac{1}{4}$ d. Although financially this is not economical, he considers the benefit derived as of more value. From a supply engineer's point of view, the fact that a cooking load would be greatest on Sundays he considers an important consideration. He deprecated the tendency of manufacturers of cooking apparatus to copy the lines of gas stoves; they should develop a distinctive type determined by the special requirements.

Mr. A. B. Mountain (Borough Electrical Engineer, Huddersfield) found an encouraging demand for electric irons and radiators, but cooking had not yet caught on. The best way to develop the business was to interest the ladies in the testing and use of the apparatus, as servants were quite indifferent and careless.

Mr. H. Visger (Leeds) considered that electric radiators were very convenient for temporary heating in a bedroom at night and morning, but out of the running compared with anthracite stoves for continuous heating even with coal at £2 5s. a ton. He favoured electric cooking even at 1d. per unit. He had made a practical test in his own house, and cooked a dinner for four people at a cost of 2'9d.

Dr. R. Pohl (Phoenix Dynamo Manufacturing Co.) had been examining figures given in a German paper relative to the cost of cooking by electricity and gas. In that particular case electricity cost 3'6 times as much as gas, but the price of the gas was 3s. 5d. per 1,000 ft., and electricity 2'4d. per unit. With gas at 2s. 5d. and electricity at  $\frac{1}{4}$ d., the cost for cooking would be equal in each case. Gas stoves had not an efficiency of more than 60 per cent., while electric cookers had from 80 to 90 per cent.

Mr. W. Lang (Leeds) referred to the saving in weight of meat resulting from electric cooking without loss of flavour. The heating discs have to be made very light, and are apt to develop a tendency to buckle when the cooking vessels only rest on a few points. For heating the air for bedrooms, he would suggest making a hole in the outside wall and placing an electric radiator in the hole; the air would then be warmed as it entered the room.

Mr. A. Innes (Leeds), speaking as a contractor, said that current at 1d. per unit was not cheap enough. He found that ladies invariably preferred lamp radiators. He did not approve of all the switches being fixed on a board away from the apparatus, as they were more likely to be overlooked than when attached to the apparatus. In his own house the consumption of electricity for last year was for lighting 305, heating 473, and cooking 1,214 units, which worked out at an average of 1'35d. per unit. If the price charged had been calculated on the rateable value system, as at Bradford, the cost would have been reduced to 0'9d. per unit.

Mr. E. C. Wallis (Leeds) was of the opinion it would be to the advantage of manufacturers to take the ladies more into their confidence, as they could give many useful hints with regard to cooking. In times of emergency and illness electric radiators were of great use.

Mr. J. W. Hame (Borough Electrical Engineer, York) said they had only had the rateable value system charging in force at York for about seven months, but the result so far has been gratifying. Out of 24 cooking outfits which had been connected, only two had been returned. He mentioned an instance where a church in York was heated entirely by electricity. Despite the cost, which was about 7s. a Sunday, the result was considered satisfactory, as the extra convenience more than balanced the expense.

Mr. R. N. Campion (Borough Electrical Engineer, Dewsbury) considered that an important advance had been made by manufacturers undertaking to maintain the elements for 5 per cent. of the cost of the apparatus per year, which he hoped to see reduced before long to 3 per cent.

Mr. Roles, in replying, agreed that electric heating could not compete with coal fires or central heating, but radiators, &c., had their uses for intermittent and out-of-the-way heating. In a £25 to £30 house the lady generally has to take charge of the cooking, leaving the servant to do the household work. In such cases electric cooking had advantages over gas stoves, the atmosphere was purer, and the quality of the cooking was unquestionably superior.

The subject was also discussed by the Yorkshire Local Section at Sheffield on March 26th.

Mr. W. N. Y. King (Sheffield) said his experience enabled him to estimate that in a nine-roomed house for, say, five people, the annual cost of lighting, cooking, and heating would be increased by a sum of £4 or £5 by adopting electricity, allowing £1 per year for coal for heating water. The price of gas in Sheffield being only 1s. 3d. per 1,000ft., made it practically impossible for electricity to compete as to cost of running. The various economies and convenience resulting from its use would, however, more than balance the extra cost.

Mr. E. J. Marsh (Sheffield) contended that the present cost

of cooking outfits was too high for them to be generally adopted, and also that the construction was too flimsy. They should be manufactured on sound engineering lines, making them as fool-proof as possible, and thoroughly tested before being put into the hands of untechnical people.

Mr. W. E. Burnand (Sheffield) referred to experiments he had been making in connection with the heating of rooms. He found it much more satisfactory to have a large volume of air slightly heated, than a small quantity of air at a high temperature. The best position for a radiator he found to be about two-thirds the height of the room from the floor, with the heat deflected downwards.

Mr. E. A. Barker (Barnsley) quoted actual figures for a period of twelve months as the result of his experience with electric cooking and heating. The net saving in cost of coal, after allowing £2 for coke for heating water, was £8 2s. The electricity bill amounted to £8 4s. 8d. As he saved  $1\frac{1}{2}$  lb. of meat in the cooking process per week, the value of this more than covered the £2 2s. 8d. annual increase in expenditure, the other well-known advantages being clear gain.

Mr. Hames said the fact that gas in Sheffield was as low as 1s. 3d. went to prove that  $\frac{1}{2}$ d. per unit for electricity was the maximum that could well be charged for domestic purposes, apart from lighting. He supported the remarks which had been made as to the flimsy construction of some of the earlier apparatus which had been placed on the market, also the want of thorough individual testing before delivery. At the Bradford Electricity Works, where meals were provided daily for 60 men, the chef was strongly in favour of electric cooking, not only because of the increased comfort, but on account of the saving in meat, which was a matter of personal interest to him.

## ELECTRIC LIGHTING OF A PRINTING WORKS

GOOD illumination is essential in a printing works, and a good example of how this has been attained is presented by the installation in the works of J. Boots, Ltd., at Nottingham, recently equipped by the British Thomson-Houston Co., Ltd. The main object has been to secure adequacy and uniformity of illumination, without glare or shadows, with economy in current consumption. Mazda drawn-wire electric lamps are used throughout. In all the rooms, with the exception of the machine room, the Mazda lamps are equipped with metal reflectors of scientific design. In the machine room holophane prismatic glass reflectors are used. The metal Mazdalux reflectors are of sufficient depth completely to hood the lamps, so that the brilliant filament cannot be

FIG. 1.—COMPOSING ROOM.

seen. The lighting in the composing room is partly local and partly general. The type-cases are lighted by Mazda lamps equipped with focussing Mazdalux reflectors, suspended about 4 ft. from the working plane, while the general illumination is provided by means of several extensive units fixed close to the ceiling. The illumination on the surface of the type-cases, &c., is of a high intensity, but there are no shadows, owing to the thorough diffusion and even distribution of the light. In the bindery general illumination only is employed. This is provided by a number of intensive Mazdalux units fixed close to, and spaced evenly over, the ceiling. The illumination of the machine room is also general, and is provided by intensive holophane units suspended at a considerable height from the ground. We are asked to state that

the illuminating engineers of the British Thomson-Houston Co., Ltd.—and inquiries should now be addressed to this department at Neasden Lane, Willesden—will be pleased to prepare designs for projected installations, and to demonstrate

FIG. 2.—MACHINE ROOM.

how Mazda lamps and Mazdalux reflectors, arranged on correct engineering lines, will improve the illumination of printing works and other industrial premises.

**Faraday House Old Students' Association.**—The Annual Dinner of this Association will be held at the Hotel Cecil (Victoria Hall) on Friday, April 11th, at 7 (for 7.30 p.m.), with the President, Mr. Haydn T. Harrison, in the Chair. Any Faradians desirous of attending, who have not received a notice, are requested to communicate with the Hon. Sec. of the Association, Faraday House, Southampton Row, London, W.C.

**Berlin Electricity Supply.**—The concession of the Berliner Elektrizitäts Werken expires in 1915, and the extension of the concession, or the alternative of a complete or partial purchase of the undertaking by the City, is being much discussed in Berlin in conjunction with the future power requirements of the Berlin Stadt- Ring- und Vorortbahn. The City of Berlin will bear part of the cost of conversion of the Stadt-bahn, and it is suggested that the City should take over the general light and power supply, including the railway supply, and deal with the whole from one large power station. This, it is claimed, would enable power to be supplied for the railways at the lowest rate possible. Another proposal is that the City should take over and link up all the power stations of Berlin, but leave the distribution systems and selling business in the hands of the private companies, supplying them with power in bulk. In this connection it is interesting to note that the special Commission dealing with the electrification of the Berlin railways has recommended that only half the required sum of 50 million marks be voted, and that the "Stadt und Ring," but not the "Vorort" (suburban), system be electrified.

**Copper Production in Canada.**—From the preliminary report on the mineral production of Canada for the year 1912, just published by the Department of Mines, it appears that the average price obtained for copper was 16'341 cents, as compared with 12'376 cents in 1911. The report states that there is practically no recovery of refined copper in Canada, and the production is represented by the copper contents of smelter products, matte, blister-copper, &c., together with the amount of copper in exported ores, estimated as recoverable. On this basis the production in 1912 was 34,650 tons, against 24,850 tons in 1911. The exports of copper in 1912 were: fine, in ore, &c., 34,100 tons, valued at £1,830,000, and black, coarse, or pig copper, 870 tons, valued at £49,200. The total imports of copper were valued at £1,046,500.

**High-speed Rotary Converters.**—Two 1,000-kw. 60-cycle 12-pole compound wound rotaries without commutating poles have been running successfully for over a year in a substation of the Housatonic Power Co. They are wound six-phase, and work in parallel with four 500-kw. rotaries on a traction system. Line current at 33,000 volts is transformed to 430 volts. The transformers have two  $2\frac{1}{2}$  per cent. full capacity taps above and two below 33,000 volts in the primaries, and  $\frac{1}{2}$  and  $\frac{3}{4}$  voltage starting taps in the secondaries. They have 15 per cent. inherent reactance. The rotaries will carry 50 per cent. overload for two hours, and 100 per cent. momentarily. The brushes are of a composition of copper and graphite. Speed-limiting gear is provided.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelopes.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,333.

In connection with a group of collieries there is a power plant generating about 4,000 kw., voltage 2,500, periodicity 40. At the different pits there are transformers, 2,500 to 500 volts, for supplying current to several motors, also some of the motors are driven direct from the 2,500-volt circuit. At one pit about half a mile from the power station there are several 150-kw. 2,500 to 500 volt transformers. At the generator end the neutral point is not earthed; the electrical rules in mines require all transformers fitted with some arrangement to prevent the low-tension side being charged with H.T. through any leakage, &c. This can be done, of course, by earthing the neutral point of the low-tension side of the transformer. Will it be a suitable and safe arrangement in the circumstances to earth the neutral points on the low-tension side of all the transformers and to connect all the neutrals to two common earth-plates? Supposing also that the neutral points of the generators are connected to earth, are there any objections to connecting the low-tension neutrals from the transformers to the same two earth-plates as the generator neutrals would be connected to? In addition to earthing all neutral points, is it also advisable to connect up all ironwork in connection with plant to the common neutral earth-wires?—ELECTRIC.

(Replies must be received not later than first post, April 10th.)

### ANSWERS TO No. 1,331.

No reply of sufficient merit for an award has been received.

## ANSWERS TO CORRESPONDENTS

**D. LLEWELLYN.**—(1) The resistance of 600 yards of your 37/16 cable, that is, the go and return conductors, is 0.126 ohms; the voltage drop will therefore be  $150 \times 0.126 = 18.9$  volts. (2) The resistance of 200 yards of 7/14 cable is 0.1417 ohms, and the current required to produce a voltage drop of 3 volts is  $3 \div 0.1417 = 21.15$  amperes.

## CATALOGUES, PAMPHLETS, &c., RECEIVED

**A.C. MOTORS.**—A very complete new catalogue of polyphase induction motors has just been issued by Bruce, Peebles & Co., Ltd. (Edinburgh). A number of standard patterns of machine are listed, comprising protected motors, semi-enclosed motors with expanded metal grid covers, motors for textile mills with perforated steel covers, totally enclosed motors, pipe ventilated motors, and flameproof mining motors. The above can all be of the squirrel cage, slip-ring, or automatic centrifugal starter type, and can be arranged with a two-speed stator winding. A very full specification of the motors is given in the pamphlet, together with illustrations of various parts, and of some of the different types of motor referred to above. In addition, outline illustrations and full lists of approximate weights and dimensions of every size which they manufacture are given, while full lists of technical data for 50 and 25 cycle motors are also included, machines being dealt with for three separate ranges of

voltage from 110 up to 3,500 volts, at speeds of from 1,500 down to 150 r.p.m.

**WATER-POWER INSTALLATIONS.**—A well-illustrated pamphlet from the A. E. G. (Foreign Department) describes in English several large water-power schemes carried out by the company.

**MOTOR CONTROL.**—Another new publication sent us by the A. E. G. is a catalogue of starters in controller form.

**NUMBER INDICATORS.**—A pamphlet from the Electrical Co., Ltd., gives particulars of an electrical lamp number indicator for places of entertainment. The necessary changes of connections causing the particular lamps forming the numbers to light up are made by a controller worked by a lever with a self-locking position for every point, connected by a 25-strand cable to the lamp case.

**PLUGS FOR FIXING, WIRING, &c.**—We have received from Siemens Brothers and Co., Ltd. (Woolwich), a pamphlet describing the "Rawplug" plug, of which they are wholesale agents. This plug is the piece of apparatus described and illustrated in *ELECTRICAL ENGINEERING*, March 27th, page 178. A large number of sizes are listed, and some useful hints as to their use are given in the pamphlet. Extensive tests have been made of the force required to withdraw screws fixed in these plugs, and with suitable sizes of screws and plugs a resistance of as much as 670 lbs. has been obtained in a hole drilled in slate, 45 lbs. in brick, and 500 lbs. in good plaster.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**ENGINEERING AND ELECTRICAL SUPPLIES.**—Two new leaflets from the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), deal, respectively, with a convenient form of cylindrical bellows for blowing dust out of electrical machinery and a line of sliding resistances for cinematograph and other purposes where fine current regulation is required. Another new leaflet, cancelling a previous one, describes the "Arm-earth" system of cable protection by a continuous earthed conduit, which can be applied to existing unarmoured cables. This system, which was designed particularly to meet the Home Office rules, was described and illustrated in *ELECTRICAL ENGINEERING*, August 22nd, 1912, page 468. Another new publication from the General Electric Co. is a card illustrating a range of porcelain-covered connections for conduit work.

**SERVICE CUT-OUTS.**—A complete list from Siemens Brothers Dynamo Works, Ltd., Supplies Department (38-39 Upper Thames Street, E.C.), deals exhaustively with a variety of main fuses for house-service connection from underground or overhead distribution networks, as well as for motor-control panels and ironclad switchboards. The well-known "Zed" fuse fittings are used in all designs.

**PUMPS.**—Another descriptive list from the same firm gives information about the "Melda" house-water rotary pumps, which are of very simple construction, and have only few and inexpensive wearing parts. These pumps are eminently suitable for country houses, hotels, garden supply, fire extinction, &c. Among the advantages claimed are that the pump will suck although the suction pipe is empty, and that the volume delivered depends only on the speed.

**"INDESTRUCTIBLE" CABLES.**—A pamphlet from Scholey and Co., Ltd. (151 Queen Victoria Street), describes various grades of a cable protected by a special covering, consisting of a cotton or jute braiding, impregnated with a patented composition consisting of red lead, linseed oil, and other ingredients. Cables insulated in this way are protected against atmospheric and chemical effects, and are supplied for voltages up to 2,000 for indoor and outdoor use. These cables are not, however, suitable for draw-in systems. Tests on some cable in use have shown that the insulation resistance increased with time.

**CABLES.**—An effective card from the Armorduct Manufacturing Co., Ltd. (Farringdon-avenue, E.C.), calls attention to an order for 100 miles of 5,000 megohm V.R. cable received from a railway company.

**THE LIGHTING OF PICTURE THEATRES.**—This is the title of a well-printed brochure which the British Thomson-Houston Co. (Mazda House, Upper Thames Street, E.C.) issued most opportunely at the time of the Cinematograph Exhibition last week. It describes the application of the company's well-known "Eye-rest" system of indirect illumination to these places of entertainment, and gives a fine selection of views showing the fittings and their use, several of which have been reproduced in our columns.

**Manchester Electro-Harmonic Society.**—The closing concert of the season was held on Friday last, with Mr. F. Sells in the chair. Mr. Sells said that the Society were very fortunate in their President, Mr. Pearce, and mentioning that since October the membership had risen from 70 to 170, expressed the hope that a total of 300 might be attained next season. A vote of thanks was passed to Mr. W. J. Smith, the Musical Director.

## "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

### Specifications Published March 27, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications. Names in italics indicate communicators of inventions from abroad.

26,864/11. **Starting Gear for Rotary Printing Presses.** G. W. MASCORD. The usual clutch, for reduced speed at starting, and direct drive are displaced by magnetic clutches controlled in regular sequence by the motor controller. Constructional details are given. Ten figures.

10,823/12. **Quenched Spark Gaps.** W. TORIKATA, E. YOKOYAMA, and M. KITAMURA. The electrodes practically touch. One is made of silicon, ferro-silicon, carborundum, boron, and minerals such as graphite, meteoric iron, magnetite, iron pyrites, copper pyrites, bornite, molybdenite, marcasite, native copper, or a material not burnt away quickly or short-circuited, even when the electrodes are practically in contact. Four figures.

11,434/12. **Single-phase Repulsion Motor.** MASCH. OERLIKON. The motor has a shunt characteristic, and the direction of rotation is changed by shifting the magnetic axis. The stator winding is divided into groups connected in series, and part is reversible. Auxiliary brushes displaced 90° from the short-circuited brushes are connected to the reversible stator winding. Arrangements are made so that the current in the working brushes is not reversed during the change-over. If a transformer is used to feed the auxiliary brushes, it is provided with a supplementary winding, through which the working brushes are constantly short-circuited. Five figures.

25,586/12. **Adjustable Grills or Salamanders.** R. S. DOWNE and B. & K. Co. To vary continuously the distance between the heat source and the food support, the latter is carried on a pair of lazy tongs, which are operated by a hand-wheel and screw. Three figures.

26,249/12. **Fixing Metal Filaments to their Supports.** H. A. GILL (*Wolframlampen A.G.*). The pairs of ends of the filaments are held by being nipped, without heat, in double eyelets on the nickel, copper, or nickel-copper arms. Three figures.

### Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** B.T.-H. (*G.E.C., U.S.A.*) [Distributing systems] 6,212/12; BROOK [Insulators for railway conductor rails] 6,473/12; BLAKE and KILBURN [Conduit support] 6,562/12; BJUR [Automobile lighting systems] 6,803/12; FELLEBERG [H.P. insulators for overhead lines] 17,761/12.

**Dynamos, Motors, and Transformers:** LEITNER [Variable-speed dynamos for starting internal-combustion engines, &c.] 6,189/12; SHAW and SHARP [A.C. generators] 10,427/12.

**Electrometallurgy and Electrochemistry:** TISCHENKO [Refining of iron] 5,855/12; UBBELOHDE [Resistance furnaces] 9,203/12; VON LIEBEN, REISZ, and STRAUSS [Improvements in discharge tubes having an incandescent cathode] 15,975/12; WERTH [Continuous action apparatus for the electrolytic treatment of metal strips and wires] 16,535/12; LEE [Apparatus for endo-thermic gas reactions] 23,459/12.

**Heating:** LONDON ELECT. TRADING CO. and BASTIAN [Element for hair-dryers] 5,723/12; DE BERNARD and EBBSMITH [Therapeutic appliances] 19,267/12; BYNG and COLLINGS, 28,542/12.

**Ignition:** BLOXAM (*Bosch*) [Adjusting time of] 17,489/12.

**Incandescent Lamps:** B.T.-H. (*A.E.G.*) [Machine for making lamp bases] 13,788/12.

**Instruments and Meters:** ROBINSON [Taximeters] 27,536/11; KILROY and EVERSHED & VIGNOLES [Indicator for use more particularly on ships] 6,792/12; HATFIELD and CHAMBERLAIN & HOOKHAM [Electrodes for electrolytic instruments] 18,341/12; LANDIS and GYR [Two-rate] 24,503/12.

**Switchgear, Fuses, and Fittings:** SMITH [Incandescent lamp switching] 5,814/12; CLATWORTHY [Automatic gear for starting switches, &c.] 6,599/12; BONNELLA [Bell push] 10,360/12; DAY [Terminal mounting and cord gripping for lamp-holders, &c.] 14,306/12; KNOFF [Pocket lamps] 22,093/12; RILEY [Motor controllers] 25,591/12.

**Telephony:** COX [Spreaders for receiver casings] 26,474/12.

**Traction:** TYRER and WHALLEY [Working of tramway track and conductor points] 5,721/12; MELLOR [Railway signalling] 5,850/12; HOLLIDAY [Traffic controlling] 486/13.

**Miscellaneous:** PHILIP and STEELE [Detectors for combustible gases] 27,281/11 and 3,002/13; ROZIER [Lifts] 6,304/12; BRAARUP [Electro-medical appliance] 6,645/12; ERICH F. HUTH GES. and BEHNE [Remote adjustments by periodic oscillations of different frequency] 9,181/12; NEAL and MOORE [Fire alarm]

10,927/12; WHITEHEAD & Co. A.G. [Submarine mines] 17,126/12; BELDIMAN [Rotary engine with electric power transmission] 19,787/12; GROSS [Thermo-electric batteries] 25,372/12; BOHLE and "VOLTA" COMMANDITGESELLSCHAFT FÜR ELEK. KLEINBELEUCHTUNG [Dry batteries] 26,699/12.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Distributing Systems, &c.:** A.E.G. [D.C. machine braking by parallel armature resistances] 5,529/13.

**Electrometallurgy and Electrochemistry:** SCHOOF [Starting a furnace for the production of metallic powders] 5,510/13.

**Ignition:** KEITERING, 4,508/13; SCHLICK, 5,365/13.

**Switchgear:** BOUTARD [Automatic] 5,546/13.

**Traction:** ANGUS [Railway signalling and control] 5,916/13, 5,917/13, and 5,918/13.

**Miscellaneous:** NICHOLSON [Electrically-operated mechanism] 30,059/12; SOC. CONIDELON [Manufacture of a catalyst containing vanadium] 5,174/12; PAUL [Gyroscopic steering for ships] 5,453/12 and 5,454/12.

### Opposition to Grant of Patents entered

1,178/12. **Imitation Candles.** E. J. WILSON and the CANDOLITE Co. A construction to ensure a rigid connection between the lamp-holder and the candle sconce is described.

19,890/12. **Locomotives, Boats, &c.** MASCH. OERLIKON. [ELECTRICAL ENGINEERING, Feb. 6th, 1913, p. 80.]

### Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

7,277 of April 6th, 1899. **Two-rate Meters.** H. ARON and ARON ELECTRICITY METER, LTD. There are two dials and two counting trains; the change is made from one train to the other by clockwork, which has wheels displaceable longitudinally on their axes at predetermined times. The mechanism connecting with the counting train consists of three gear-wheels in mesh in a tilting frame. The central wheel is constantly in gear with the counting train, while one of the others is in gear with the recording train.

7,370 of April 7th, 1899. **Multiple Unit Train Control.** H. H. LEIGH (*F. J. Sprague, America*). This specification amplifies the earlier Sprague patents for multiple unit control. This system was worked in this country by the B.T.-H. Co. By means of the combination of working parts herein described, the number of control wires connecting the cars is reduced. The reverser drum is operated by a pilot motor, in combination with which is a limit switch and a circuit-breaker for the series parallel and reverser switches. Besides the interlocking and cut-out arrangements described, it is arranged that the circuit is opened in passing from the series to the parallel position. The trolley shoes on each car are connected together. Fourteen figures.

7,427 of April 8th, 1899. **Rotary Converter.** J. IMRAY (*Soc. Anon. pour la Transmission de la force par l'Electricité*). The converter consists of an asynchronous single or polyphase motor mounted on the same axis as a D.C. machine. The asynchronous armature coils are connected to those of the D.C. armature, and also in shunt to the commutator segments, but the groups of coils are displaced symmetrically to a fixed plane. The speed, when once started, is one half that of a similar synchronous motor. The machine is reversible.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Arc Lamps:** F. M. LEWIS [Series single coil] 27,199/03.

**Dynamos:** B.T.-H. (*G.E.C., U.S.A.*) [Self-exciting and self-compounding A.C.] 26,093/05.

**Incandescent Lamps:** B.T.-H. (*G.E.C., U.S.A.*) [Machine for welding platinum to copper wires; also counting and arranging] 27,404/04; C. H. STEARN and C. F. TORHAM [Bulb exhausting] 28,680/06.

**Instruments and Meters:** EVERSHED & VIGNOLES and S. EVERSHED [Converting reciprocating into locked rotary step-by-step movement for counting trains] 24,646/99; J. Y. JOHNSON (*W. C. Heraeus, Germany*) 27,298/07; [Resistance thermometers] 27,569/07.

**Switchgear, Fuses and Fittings:** A. ECKSTEIN and A. J. D. KRAUSE [Tubular fuse] 22,819/00; A. WALTHO [Bayonet fittings, &c.] 28,637/06.

**Telephony and Telegraphy:** F. RITCHIE [Telautographs—adjusting and testing] 25,496/01; C. ADAMS-RANDALL [Telephony] 27,095/04.

**Miscellaneous:** B. J. B. MILLS (*General Fire Alarm Teleg. Co., U.S.A.*) [Street-box fire-alarm system] 24,717/99; J. T. DAWES [Magnetic separators] 27,298/05.

## ELECTRIC TRACTION NOTES

The repairs to the two generators and other apparatus in the Greenwich power house of the London County Council Tramways, that were damaged owing to a switchboard mishap, as described in *ELECTRICAL ENGINEERING*, March 20th, p. 160, are complete, the station is at work normally, and the full car service is now running.

The conversion of the East London Railway, which runs from Shoreditch to New Cross, and connects up the Great Eastern, L.B. & S.C. Ry., the S.E. and Chatham Railways with the Metropolitan and District Railways, is now complete. The last steam train was run on Sunday night, and electrical working has been carried on exclusively for the passenger traffic. The line is 5½ miles in length, with intermediate stations at Deptford, Rotherhithe, Wapping, Shadwell, and Whitechapel, and passes through Brunel's original Thames Tunnel. The equipment is generally similar to that of the Metropolitan and District Railways, except as regards the automatic signalling, the leading features of which were pointed out in *ELECTRICAL ENGINEERING*, March 20th, p. 165, and April 11th, 1912, p. 194. The conversion was carried out jointly by these two railways in conjunction with the South Eastern Railway Co., and the electric passenger service is being worked by the Metropolitan Railway with their ordinary rolling stock. Power is taken from the Lots Road station of the London Electric Railways through a new sub-station at Surrey Docks, which contains three 300-kw. Westinghouse rotary converters and the necessary transformers and switchgear. The pumping stations at Surrey Docks and Rotherhithe have been provided with electric pumping plant to replace the original steam pumps.

The *Elektrotechnische Zeitschrift* points out that, as a result of a recent decision of the German Patent Office, the validity of Patent No. 153,730/01, by G. Winter and F. Eichberg, covering the principle of the Winter-Eichberg single-phase commutator motor, cannot now be questioned. The patent covers a motor in which both stator and rotor are connected to the supply mains, and in which there exists a variable cross-field at 90° to the main field. This principle has been the foundation of numerous later designs by Richter, Alexander, Ossana, Latour and other workers.

The German Reichstag Commission dealing with the proposed conversion of the Berlin city and suburban railways has decided against the provision of 50,000,000 marks required for complete electrification, but has recommended the voting of half that sum towards the electrification of the "Stadt und Ring" system only, and not the "Vorort" system. The authorities are requested to submit a further report on the result of certain prescribed experiments with electric traction, and on the choice of systems, &c., before applying for a further sum. Further investigation as to the economy of converting the Vorort (suburban) lines is also required.

The Commission has completed some further experiments with a new type of steam locomotive especially constructed to give high acceleration, the experiments resulting favourably to electric traction.

The traffic problem in Manchester is apparently gradually assuming such proportions that the suggestion has been made to form a traffic board consisting of representatives of the five committees of the Corporation, with a view to devising some comprehensive plan for dealing with the situation.

According to the *Elektrotechnische Zeitschrift*, the Italian Railway Authorities are so satisfied with the electric working of the Giovi tunnel line that they have decided to convert immediately to electric working the line from Ronco to Sampierdarena, which runs parallel with the Giovi line. Power will be supplied by the Società delle Forze della Maira, who have recently put into operation a 50,000-h.p. hydro-electric power station at Dronero (Piedmont), on the Maira, and who will later also supply the power for the Mont Cenis line.

The contracts for the operation of the dual rapid-transit

system for New York City have just been signed. The existing single-track mileage is about 271, but in 1917, when it is thought the new system will be in operation, it will be increased to about 600. About £62,500,000 is being spent in new lines, while a third of this amount covers the existing systems.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

As announced in our Patent Record last week, the patent relating to the method of transmission on submarine telegraph cables devised by Mr. John Gott is now available at the Patent Office. There is little more in it than was described in our issue of February 27th. Fig. 1 shows the connections at the transmitting end, and Fig. 2 the connections of the tongue and contacts of the relay at the receiving end. It is clear that the signals are sent in alternate directions through the cable, and that the relay rectifies them into unidirectional currents. Fig. 3 is an alternative arrangement at the transmitting end, not mentioned in our previous note. The discharge current in this case is not taken through the relay. Instead of this a transformer is connected with its primary

between the mid-point of the battery and earth and its secondary connected to the coil of the relay. The object of this alternative arrangement is apparently to effect the reversal when the signalling current is broken, and to enable the current on the next depression of the key to act as a retaining current, ensuring perfect connection between the tongue and contact of the relay.

The Crown Agents for the Colonies have decided to erect wireless telegraph stations at Barbados, Mombasa, Penang, Singapore and Hong Kong. It is stated that tenders have been received, and that, subject to the necessary guarantees, the contract will be given to the Anglo-French Wireless Co., the English branch of the Goldschmidt Co.

The Post Office Telegraph Department has intimated its intention of laying an underground cable from Glasgow to Edinburgh at an early date.

The report for 1912 of the Automatic Telephone Manufacturing Co. shows a balance of £370 after meeting the full 6 per cent. preference dividend, and writing off £1,313 from preliminary expenses. In the early part of 1912 two automatic exchanges, each of about 500 lines, were completed for the Post Office Authorities, and these continue to give satisfaction. Other automatic equipment orders to the extent of about 8,800 lines have since been received.

According to the *Daily Telegraph*, the Expert Committee appointed by the House of Commons to consider the various systems of wireless telegraphy, in connection with the Select Committee's investigation, recently visited Slough and watched certain experiments with the Goldschmidt system. The

average rate at which messages were received is said to have been between thirty and forty words a minute. The members of the Expert Committee are to watch further experiments of the Goldschmidt system in Germany.

Since our last issue, the whole time of the Select Committee of the House of Commons, which is inquiring into the proposed Imperial wireless telegraph scheme, has been occupied in hearing evidence from Sir Rufus Isaacs (the Attorney-General) and Mr. Lloyd George (Chancellor of the Exchequer) with regard to their dealings in shares of the American Marconi Co. From this evidence it has been shown that the Attorney-General purchased 10,000 shares of this Company several weeks after the contract with the English Marconi Co. had been signed. The purchase was made, he said, after he had satisfied himself that in the event of the English Co. being granted the contract for the Imperial scheme, the American Co. could not possibly have benefited. Although he was offered them at less than market price he insisted upon paying the full market price at the time. One thousand of these shares were subsequently sold to the Chancellor of the Exchequer, and another thousand to the Master of Elibank. This transaction was the only one which either of the Ministers in question have had in Marconi shares, although it has been suggested in certain newspapers that there had been extensive dealings in the English Co.'s shares.

Some astonishment has been caused by the resignation of one of the members of the Committee, viz., Mr. Harold Smith, the Unionist Member for Warrington. It appears that Sir Rufus Isaacs had communicated "most vital information" to certain members of the Committee some time before the disclosures as to the dealings in American Marconi shares had been made, and Mr. Smith, as well as others on the Committee, desired to know who these particular members were, and when the communication was made to them. As the result of a private consultation, the Committee decided by a majority that Sir Rufus Isaacs was not to give the information required.

A new Government telephone factory is being erected at Bordesley Green, Birmingham, to take the place of the National Telephone Co.'s factory at Nottingham, which has been abandoned by the Post Office authorities.

It was stated in the House of Commons last week that about 900 agreements have been accepted for rural party telephone lines, and that 400 subscribers are now using the service. Proposals under consideration will provide for approximately 500 more subscribers, and the demand for this class of telephone service has been such that the Post Office is in communication with the Treasury with a view to an extension of the grant of £10,000 which was made for this purpose last year.

Successful experiments are reported to have been carried out between Berlin and Nauen with a wireless telephone apparatus, employing a high-frequency machine devised by Count Arco. According to the *Elektrotechnische Zeitschrift*, newspaper articles were read out and transmitted without difficulty over a distance of 400 kilometres.

It is stated that the Straits Settlement Government has decided to construct 5-k.w. wireless telegraph stations at Penang and Singapore, which will be independent of the proposed Imperial scheme.

The Bagdad-Bassorah line was down again on 26th March, and the Seattle-Sitka cable failed on the same day, telegrams for Alaska being sent via Ashcroft. On this day, also, the Teheran-Kermanshah line was repaired, as well as the cables between Shanghai and Nagasaki.—The Seattle-Sitka cable was restored on the 27th ult.—The Fao route was restored on the 28th ult., and the Djedda-Souakin cable failed on the same day. Telegrams for all places in the States of Coahuila, Chihuahua, Morelos, Sinshoa and Sonora in Mexico can now be accepted at sender's risk. Owing to a severe storm there is considerable delay to Moroccan offices.—The cable steamer *Relay* was at Halifax at the end of February, after repairing the French Co.'s section at St. Pierre.

## LOCAL NOTES

**Chichester: Electricity Works and Ice Manufacture.**—The Chichester Electric Lighting and Power Co. is installing at the electricity works an ice plant capable of manufacturing 10 tons of ice per day, as well as cold-storage accommodation to the extent of 10,000 cub. ft. The horse power required for running the plant, which will be in continuous operation

during the summer months, is 42, and already numerous contracts are about to be fixed up, both for a regular supply of ice, and for cold-storage accommodation.

**Leeds: Power Supply.**—The Tramways and Electricity Committee, finding it necessary to meet the competition of private generating plants, are proposing reductions in the tariff for power supply.

**Redditch: Position of Electricity Undertaking.**—The Advisory Sub-committee which was appointed by the Council a short time ago to investigate the position of the Municipal Electric Supply undertaking, both from the financial and engineering points of view, has now issued its report. The Committee has come to the conclusion that the non-success of the undertaking in the past, and from which it must continue to be handicapped in future, is to a considerable extent due to (1) the initial mistake in installing a high-tension alternating-current system; (2) the defective laying of cables; (3) the inconvenient situation of the electricity works, and (4) the use of a gas plant, which has proved a failure. The capital cost of superseded machinery amounts to £10,000, and a sum of £600 per annum will have to be paid until 1929 in respect of unproductive capital expenditure. The Committee state that the reasons for the non-success of the undertaking are to a large extent attributable to causes for which the Borough Electrical Engineer cannot be held responsible. At the same time, it is pointed out that some efforts should be made to improve the commercial management of the undertaking, a branch to which the Borough Electrical Engineer has not been able to give sufficient attention owing to the engineering difficulties. Mr. W. J. Ferguson, the Borough Electrical Engineer, has, however, given notice to terminate his engagement, and the Committee recommend that a new works manager be appointed at a commencing salary of £250 per annum. Mr. Ferguson is to be paid £150 in respect of special service as consulting engineer.

**Truro: Electric Lighting.**—The Corporation has received a notification from the Board of Trade that their application for an electric lighting provisional order has been granted. In our issue for March 13th we reported the inquiry in London at which the applications for orders by the Corporation and the Truro Gas Co. were investigated.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Burnley.**—It is proposed to instal a 2,000-kw. turbo-alternator with two 500-kw. rotary-converters and transformers at the electricity works. A new sub-station containing two 300-kw. rotary-converters is also to be installed. The total cost of these extensions is put at £28,171.—A loan of £7,000 for mains and services is to be taken up.

**Chester.**—The Borough Electrical Engineer recommends the installation of a battery, switchgear, &c., at an estimated cost of £11,550. Of this it is proposed to pay £4,000 out of reserve fund, and to apply for a loan for the remainder. In his report, Mr. Britton emphasises the fact that he has not at present sufficient reserve plant to carry him through the coming winter.

**Darlington.**—Jet condensing plant capable of condensing 20,000 lb. of steam per hour. Borough Electrical Engineer. April 16th.

**Doncaster.**—Sanction to a loan of £12,500 for new plant is to be applied for. A new 1,000-kw. turbo-alternator is contemplated.

**Fife.**—The Fife Electric Power Co. propose to instal an additional 5,000 kilowatts at their Townhill power station.

**Londonderry.**—The Borough Electrical Engineer estimates the probable expenditure on plant and cables during the next five years at £13,000, and it is proposed to apply for a loan

for this amount at once in order to avoid the necessity of repeated applications for small sums.

**Manchester.**—Sanction is to be sought to the following loans: mains, £45,000; services, £15,000; consumers' sub-stations, £15,000.

**Peterborough.**—The City Engineer has been instructed to draw up a specification for a 500-kw. generating set and two Lancashire boilers.

**Rochdale.**—Sanction to a loan of £45,000 for electrical extensions has been received.

**Salford.**—Extra high-tension switchgear. Borough Electrical Engineer. April 10th.

**Stalybridge.**—The Joint Electricity Board are amending their application for a loan, from £20,000 to £22,554.

**Tullamore (Ireland).**—A consulting engineer is to be called in with regard to an electric lighting installation.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Barnsley.**—New town hall.

**Barry.**—Electrical equipment of Glamorgan County Council's training college. Clerk, County Hall, Cardiff.

**Burnley.**—New Territorial Drill Hall.—Architect, W. A. Quarnby, Grimshaw Street.

**Carlisle.**—New post office. H.M. Office of Works, London.

**Doncaster.**—New technical school. Builder, Mr. P. Rhodes, Leeds.

**Dublin.**—New Corporation buildings. City Architect.

**Dumfermline.**—New institution in Netherton district.

**Edinburgh.**—New school at St. Leonard's Lane. Architect, J. A. Carfrae 3 Queen Street.

**London: L.C.C.**—Electrical installation at Shadwell High Street special school. Chief Engineer, J. W. Humphreys. April 23rd.

Electrical installation at Jeffries' Almshouses, Kingsland Rd., Shoreditch. 56 lighting points. Chief Engineer, J. W. Humphreys. April 15th.

**Port Talbot.**—Block of business premises. Architects, Evans and Jones.

**Sheffield.**—New Council school, Hillsborough. City Architect.

**Watford.**—Twenty-two workmen's dwellings.

### Miscellaneous

**Australia.**—The Sydney Corporation require a supply of meters and arc-lamp carbons. Particulars, 73 Basinghall Street, E.C.

**Leicester.**—New tramcar repairing shops are to be erected at an estimated cost of £23,000.

**Limerick.**—A twelve months' supply of stores. Borough Electrical Engineer. April 10th.

## TENDERS RECEIVED AND ACCEPTED

**Bedford.**—An inquiry was held into the Council's application for sanction to borrow £11,590 for additional generating plant. As already notified in our columns, it is proposed to instal Diesel-engine plant, for which Messrs. W. H. Allen, Son and Co.'s tender has been provisionally accepted. During the course of the inquiry, Mr. T. E. Ekin, the inspector, remarked that his experience of Diesel engines has been unfortunate, and the inquiry was ultimately adjourned until April 10th for further information with regard to the engines.

**Belfast.**—The tender of Messrs. Chamberlain and Hookham has been accepted for meters.

**Clacton-on-Sea.**—The application of the Corporation for sanction to borrow £6,000 was inquired into last week by a Local Government Board inspector. It is proposed to instal Diesel-engine plant, for which the tender of the Consolidated Diesel Engine Co. has been provisionally accepted.

**Haslingden.**—The following tenders have been accepted for sub-station machinery: rotary-converter, British Thomson-Houston Co.; switchboard panel, Ferranti, Ltd.; extension of tramway switchboard, Chloride Electrical Storage Co.; feeder cable, Siemens Bros. and Co.

**Heston and Isleworth.**—The tender of Messrs. Chamberlain and Hookham has been accepted for meters.

**Hornsey.**—A contract has been placed with Messrs. Isaria, Ltd., for electricity meters.

**London: Fulham.**—The Board of Guardians have accepted the tender of the Hart Accumulator Co. for a storage battery of 102 cells.

**Wrexham.**—The following tenders have been accepted: meters, Reason Manufacturing Co.; carbon and metal filament lamps, Edison and Swan United Electric Light Co.

## APPOINTMENTS AND PERSONAL NOTES

Mr. E. B. Gimmingham and Mr. C. E. Hunter, Works Managers of the Lamp and Engineering Departments of the Edison and Swan United Electric Light Co., Ltd., have been elected to seats on the Board of the Company. It will be remembered that Mr. H. Wolfenden resigned his position as Chairman recently and was succeeded by Mr. C. J. Ford.

Mr. E. P. Bennett has been transferred from the Sales Department of the London office of Simplex Conduits, Ltd., to the position of Manager of the Liverpool branch.

Mr. Norman Young, chief of the testing staff of Messrs. James Howden and Co., of Glasgow, has taken up an appointment with the Consolidated Diesel Engine Co., of Ipswich.

We regret to learn that Mr. J. E. Starkie, Borough Electrical Engineer at Burnley, is suffering from a nervous breakdown. He has been granted leave of absence by the Corporation.

The salaries of the Mains Superintendents in the Stoke-on-Trent electricity undertaking have been increased as follows: I. Makin, from £180 to £135 per annum; S. J. Marston, from £145 to £150; D. C. Redfern, from £135 to £140 per annum.

Mr. R. B. Leach has been appointed Electrical Engineer and Tramways Manager to the Heywood Corporation at a salary of £200 per annum. There were 134 applicants.

A works manager is required for the Redditch Electricity undertaking at a commencing salary of £250 per annum.

A meter tester, experienced in polyphase work, is required. (See an advertisement on another page.)

A charge engineer is required at the Paisley electricity works. Engineer and Manager, April 7th.

An electric supply company in the Far East requires a junior assistant electrical engineer. (See an advertisement on another page.)

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith and Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £70 to £70 10s. (Last week, £68 15s. to £69 5s.)

**Meldrums, Ltd.**—Mr. A. B. Scorer has joined the board of this Company, the London office of which has been moved to 92 Grosvenor Road, S.W.

**W. G. Watson and Co., Ltd.**—This firm, who are well-known electrical engineers, suppliers and contractors, of 279 Clarence Street, Sydney, are about to open a London office. Mr. Watson will be in England toward the middle of the year, and invites communications on business matters.

**Bankruptcies.**—The last day for receiving proofs in the bankruptcy of A. G. Adamson, Electrical Engineer, 22 Willcott Road, Acton, is April 12th. The trustee is the Official Receiver, 14 Bedford Row, W.C.

**Canadian Agency.**—A Winnipeg firm is desirous of getting into communication with British manufacturers of electric stoves. Further particulars, Board of Trade, 73 Basinghall Street, E.C.

## NEW COMPANIES

**SOUTHERN BRAZIL ELECTRIC CO.** Registered by Messrs. Linklater & Co., 2 Bond Court, Walbrook, E.C. Capital £1,000,000.

**ELECTRIC ZINC CO.** 5, The Sanctuary, Westminster. Capital £2,000,000.

## SUMMARY

A LARGE electric cooking equipment at Brighton is described and illustrated. (Page 198.)

A JOINT scheme of electric and gas lighting for the streets of Manchester has been prepared. (Page 198.)

THE new power house at Hanley, which has been

built to deal with the increasing load in the various districts comprised in the federated borough of Stoke-on-Trent, is now complete. It contains two 1,500 kw. three-phase alternators, and is connected by new trunk mains to converting plant in the older stations at Burslem, Stoke, and Longton. (Page 199.)

THE preliminary programme of the visit of the Institution of Electrical Engineers to Paris next month has been issued. (Page 203.)

PARTICULARS have been announced of the examinations for Associate membership, which are about to be introduced by the Institution of Electrical Engineers. (Page 203.)

THE Paper by Mr. S. L. Pearce and Mr. H. A. Ratcliffe, on Street Lighting in Manchester, has been further discussed by the Glasgow Local Section of the Institution of Electrical Engineers. (Page 203.)

AN electrically worked tube cleaner, some new cinematograph theatre dimmers, and cast-iron distribution boxes are described in illustrated articles on page 204.

A PROBLEM concerning the connections of transformers in the Merz Price protective system is discussed in our Questions and Answers Columns. (Page 205.)

THE specifications published by the Patent Office on Thursday last included one for an automatic starting arrangement for attachment to ordinary motor-starters by W. A. Clatworthy, and one for an adjustable frequency alternator employing pole-changing windings by the Crypto Electrical Co. and H. G. Sharp. A patent by A. Muirhead for sending-on stations in submarine telegraph-working expires during the current week, after a life of 14 years. (Page 206.)

JUDGMENT was reversed in the appeal in the House of Lords by the London Electric Supply Corporation against the Westminster Electric Supply Corporation. No injunctions were granted, but declarations were suggested in which it is set forth that the Westminster Co. must not act detrimentally to the London Co.'s interests in the Westminster area where they are acting as managers of the London Co.'s undertaking. (Page 207.)

WE give particulars of the electrical law suits which are likely to be heard during the Easter sittings. Among them is an important action for infringement of patent by the Marconi Co. against the Helsby Wireless Telegraph Co. (Page 207.)

Two further members of the House of Commons Committee inquiring into the Imperial wireless telegraph scheme have resigned. It is expected that the Technical Committee appointed by the House of Commons will report early in May.—We review the first issue of the *Wireless World*, issued by Marconi's Wireless Telegraph Co.—Reference is also made to the

New York—San Francisco telephone line. (Page 208.)

SATISFACTION is expressed with the working of the Stevens petrol-electric 'buses at Liverpool.—Two petrol-electric motor-cars have been put into service on the Chicago, Milwaukee, and Puget Sound Railway.—The Chief Railway Commissioner to the Victorian Government is to visit Europe and America to study electric railways. (Page 209.)

THE Coventry Corporation have been granted powers to extend their electric supply area in spite of opposition by the Leicestershire Power Co.—A proposal to supply power at  $\frac{1}{2}$ d. per unit in Aberdeen has given rise to much discussion.—The rateable value system of charging is recommended for adoption at Sheffield.—The Stockton Corporation are to take a supply in bulk from the Cleveland Power Co. (Page 209.)

SUB-STATION switchgear is required at Bradford; mains at Halifax, Newcastle-under-Lyme, and Stoke-on-Trent; plant, mains and sub-station equipment at Leeds; generating plant at Mexborough and Newport (Mon.). A loan of £2,000 is to be taken up at Accrington; a rotary converter is required at Stockton; large quantities of telephone material in Tasmania; and a twelve months' supply of incandescent lamps at Bedford. (Page 209.)

## ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, APRIL 10TH.

*Institution of Electrical Engineers.*

8 p.m. "Self-Synchronising Machines (Self-starting synchronous motors and rotary converters)," by Dr. E. Rosenberg.

*Institution of Electrical Engineers: Dublin Section.*

8 p.m. At Royal College of Science. "Interpoles, their Design and Use," by R. G. Allen.

FRIDAY, APRIL 11TH.

*Physical Society.*

8 p.m. At Imperial College of Science, S. Kensington. "On Some Errors in Magnetic Testing due to Elastic Strain," by A. Campbell and H. C. Booth.

SATURDAY, APRIL 12TH.

*Birmingham and District Electric Clubs.*

6.30 p.m. At Swan Hotel, New Street. Concert (Ladies' Night).

MONDAY, APRIL 14TH.

*Institution of Electrical Engineers: Western Section.*

4.30 p.m. At Cardiff. "High-tension Continuous Current or the Thury System in Mines," by S. F. Walker.

TUESDAY, APRIL 15TH.

*Illuminating Engineering Society.*

8 p.m. At Royal Society of Arts. Joint meeting with Institutions of Electrical and Gas Engineers, and Institution of Municipal and County Engineers. "The Specification of Street Lighting," by A. P. Trotter.

*Institution of Electrical Engineers: Scottish Section.*

8 p.m. At 207 Bath Street, Glasgow. "Power Supply on the Rand," by A. E. Hadley.

WEDNESDAY, APRIL 16TH.

*Electrical Trades Benevolent Institution.*

6.30 p.m. Annual Festival Dinner at Trocadero.

*Institution of Electrical Engineers: Students' Section.*

7.45 p.m. At Victoria Embankment. "Alternating-current Railway Signalling," by T. J. Hornblower.

FRIDAY, APRIL 18TH.

*Batti-Wallahs Society.*

8 p.m. Smoking Concert at Holborn Restaurant.

## The London Electrical Engineers.

(TO-DAY) THURSDAY, APRIL 10TH. C. Company.—Recruit and Company Training, 7 to 10 p.m.

FRIDAY, APRIL 11TH. D. Company.—Company Training, 7 to 10 p.m.

SATURDAY, APRIL 12TH. Headquarters open from 10 a.m. till noon.

MONDAY, APRIL 14TH. A. Company.—Recruit and Co. Training, 7 to 10 p.m.

TUESDAY, APRIL 15TH. B. Company.—Co. Training, 7 to 10 p.m.

THURSDAY, APRIL 17TH. C. Company.—Recruit and Co. Training, 7 to 10 p.m.

FRIDAY, APRIL 18TH. D. Company.—Co. Training, 7 to 10 p.m.

SATURDAY, APRIL 19TH. Headquarters open from 10 a.m. till noon

## ELECTRIC COOKING AT BRIGHTON

THROUGH the kindness of Mr. J. Christie, Engineer and Manager of the Brighton Electricity Department, we are able to reproduce here a photograph of the first electric cooking installation on a large scale at Brighton. This electric kitchen is due to the enterprise of Messrs. Staffords, of Western Road, and has now been running for a few weeks. The firm has been reconstructing its staff accommodation, and the cooking for a staff of some seventy hands is now being done entirely by the electrical equipment, which was supplied by Messrs. T and J. Jackson, Ltd. (38 Blandford Street, Baker Street, W.). So far, we are told, it has given the greatest satisfaction, and Mr. Christie anticipates as a result of its success a very substantial accession of new business in the electric cooking direction in the numerous boarding houses and hotels of Brighton.

The kitchen is at Messrs. Stafford's boarding house in Crown Street, where the staff dining rooms are situated. The equipment comprises eight hot-plates on which saucepans and other utensils may be placed; two large ovens, where several big joints can be cooked at the same time, and a hot

COMPLETE ELECTRIC COOKING EQUIPMENT.

cupboard in the centre, deriving its heat from the surplus heat of the ovens. All the heating elements are provided with three degrees of heat, and all the control switches and fuses are placed on a distributing board clear of the range, which also carries indicating lamps, so that it can be seen at a glance what circuits are on.

## MANCHESTER STREET LIGHTING

A Joint report upon the lighting of several of the main streets of Manchester, which has been prepared by Mr. S. L. Pearce, Electrical Engineer, and Mr. J. G. Newbigging, Gas Engineer, was approved by the Lighting Committee of the Corporation last Friday. The engineers say they are agreed that a further extension on a moderately large scale of the lighting of the principal thoroughfares in the city should be made with high-pressure gas and electric arc or metal-filament lamps. A schedule of streets allocated to electric and gas lighting respectively accompanies the report. Generally speaking, the shopping districts are to be lighted electrically, and principally those within the central area of the city. In making the division, the position of existing arc lighting cables was considered as well as the suitability or otherwise of the streets for centrally suspended or side lighting, the former being generally allocated to electricity. The length of the streets to be lighted by electricity is 11,835 yds., and that of the streets to be lighted by high-pressure gas is 13,500 yds.

A capital expenditure of £18,000 on gas and £15,000 on electric lighting is contemplated. The scheme does not embrace secondary thoroughfares, &c., and the engineers expressed no opinion as to Stretford Road. By a majority vote of the Lighting Committee, however, this street was added to the list of those to be lighted electrically.

**Meter Approved.**—The Board of Trade have approved of the Chamberlain & Hookham three-phase, watt-hour meter, type A.I.T., and the means for fixing same.

## ELECTRIC SUPPLY AT STOKE-ON-TRENT

THE six pottery towns of Burslem, Fenton, Hanley, Longton, Stoke-upon-Trent, and Tunstall, which now form the federated County Borough of Stoke-on-Trent, are under one management as regards their electricity supply, and the extensions of plant which were becoming necessary at the time of the federation of the different local undertakings have been provided in a new power-house in a central position, instead of additions to the older local stations. This new electricity works is now complete and is being formally inaugurated to-day.

Before describing its equipment, it may be well to give a few particulars of the older systems. The local generating

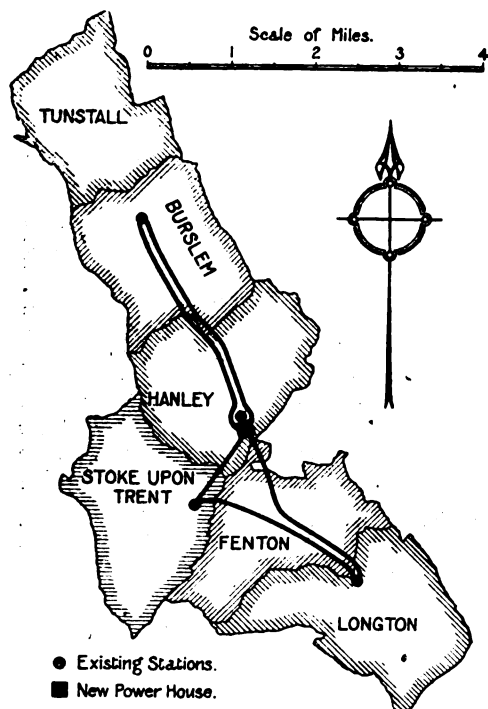

FIG. 1.—SKETCH MAP OF DISTRICT SHOWING NEW AND OLD GENERATING STATIONS AND INTERCONNECTING TRUNK MAINS.

stations were four in number, at Burslem, Hanley, Longton, and Stoke respectively, in the positions shown in Fig. 1, and the following details will give an idea of the size of each undertaking. The Burslem station supplied the northern part of the area, including Tunstall, Burslem, and the district of Wolstanton (outside the federated area), by a three-wire continuous-current  $2 \times 220$  volt distribution system. The output of the station was about 1,700,000 units per annum; the peak load attained to some 930 kw., and the annual revenue was under £11,000. The Hanley system was the oldest, and employs single-phase 2,000-volt distribution, and, with an output of over two million units and a peak load of 1,350 kw., earned nearly £20,000 a year. The two other undertakings were smaller; Stoke sold a little under 1,200,000 units, but its peak load was about 730 kw., and its annual income £7,700; Longton, with its 426,000 units and a peak load under 300 kw., had an income of £4,300. Both of these were three-wire continuous-current systems. We had thus at the time of the federation (in 1910) a continued demand for some  $5\frac{1}{2}$  million units and a peak load of over 3,300 kw. for the whole area of 235,000 inhabitants. The nominal plant capacity at Burslem was 1,250 kw., and at Hanley 2,000 kw., but not more than some two-thirds of these outputs could be dealt with on peak with a proper reserve of plant. The Stoke station, which also supplies Fenton, was loaded up still more heavily with its 800 kw. plant capacity already carrying 730 kw. The small station at Longton was the only one capable of dealing with increasing load, as its 600 kw. of plant were not called on to give half their output. It will thus be seen that extensions of some sort were essential in the district as a whole.

Two propositions were considered to deal with the increasing load. The first was to add plant to the existing stations at a cost of £25,000 to £30,000, and the second to build an entirely new three-phase station

adjoining the old Hanley works, to connect this by trunk mains to the old generating stations, and to provide them with converting plant. The actual cost of the complete new station, with its large units of turbine plant, worked out about the same as that of the additional small units of plant in the first scheme, but the cost of the necessary trunk mains and converting plant brought the cost of the whole scheme up to about £60,000. When the new works was once built, however, the next instalment of plant would cost much less than further additions of plant to the local stations, and again lower working costs, greater flexibility and reliability would be obtained with the inter-connected system. Mr. J. F. C. Snell was called in to advise, and confirmed the Engineer's proposal to adopt the second scheme. The plan was to equip the station in the first instance with two 1,500 kw. sets, to enable it with one running and one as a spare, to supplement the local stations to the extent of dealing easily with the probable increase to the peak load of 3,300 kw. mentioned above, and to provide space and switchgear for further plant to bring the installed capacity up to 9,000 kw., which, considering the local conditions, was estimated to be the "saturation" value of the load.

The amount of power taken in the pottery trade is not very large, and the accession to the lighting load in the straggling districts of which the area is composed should not be difficult to estimate. The position of the station and of the new trunk mains can be seen from Fig. 1. Two 0.10 sq. in. Callender cables, following the same route, lead to Burslem, and the equivalent of a ring main connects the new power-house with the stations at Stoke and Longton.

As will be seen below, the station is equipped with three Stirling boilers and two 1,500 kw. Howden-Siemens three-phase, 6,000–6,600 volt, 50-cycle turbo-alternators, running at 3,000 r.p.m., and Westinghouse switchgear to deal with 9,000 kw. The following sub-station plant also forms part of the new scheme. In the new power-house itself are two 600 kw. motor-generators converting to single phase to add to the supply in the Hanley district. At Burslem two 600 kw. rotary converters have been put in; at Stoke two 500 kw. La Cour motor converters are provided; while

FIG. 2.—EXTERIOR VIEW OF NEW POWER HOUSE.

at the Longton station a pair of 300 kw. rotary converters have been installed. It is the general intention to run the new power-house continuously to take the light load, and only to start up the local plants when the peaks come on.

A view of the new power house is given in Fig. 2. It may be said at once that its main characteristics are

# BROWN-BOVERI

## AUTOMATIC PRESSURE REGULATORS

RAPID AND ACCURATE REGULATION.  
NO SPARKING.  
NO "TOUCHING UP" OF CONTACTS.

CAXTON HOUSE  
LONDON S.W.

straightforward simplicity and absence of "fads" and elaborations. What may be described as standard plant is used throughout, and the general lay-out is well thought out and bears distinct evidences of originality and careful study of the conditions. The building itself is of brick, with an

struction is only employed very sparingly, and there is practically no woodwork anywhere. The Borough Surveyor, Mr. A. Burton, acted as architect. His architectural assistant, Mr. P. H. Solon, attended to details and collaborated with the engineer, Mr. C. H. Yeaman. The cost of the building itself did not exceed £7,500.

Coal will be obtained usually by carting, but a short roadway has been made leading up from the adjoining canal, and conveying plant could be arranged to take coal direct from barges if desired later on. The present coal-conveying plant from the hopper to the overhead storage bunker is shown in Fig. 3. The arrangement enables a well-lighted firing floor right opposite the windows to be obtained. The Stirling boilers, three in number, are fitted with the Underfeed Stoker Co.'s platform type of chain-grate stoker. Forced draught is employed, and each boiler has its own short steel chimney. The feed pumps are in a pump room at the far end of the boiler house. A Weir steam pump is provided, as well as an electrically-driven Westinghouse multi-stage turbine pump. In like manner the forced-draught fans can be driven either by steam or electrically.

The engine room, of which a view is shown in the photograph reproduced in Fig. 4, is also extremely light, and a fine effect is obtained by the large windows over the switchboard, the white glazed brick, relieved with green bands, carried half-way up the walls, and the neat tiled floor. The two main sets stand over their condensing plant in the usual way, and there is ample space for future extension. The pump pits between the sets are spacious and well lighted. The turbines are of the Howden Zoelly impulse type. It may be mentioned that they have nine rows of blades and that the full- and half-load steam consumption calculated on delivery of current to the external circuit are 16.8 and 19.42 lb. per kw.-hour respectively. An overload capacity of 25 per cent. continuously and 50 per cent. for ten minutes is guaranteed. The alternators, by Siemens Bros. Dynamo Works, Ltd., are of their standard type with forced ventilation, with 8,280 cub. ft. of air passing per minute axially through the machine from the cubicle chambers beneath the floor through holes actually in the stator plates. Each rotor, which weighs  $4\frac{1}{2}$  tons and is 25 ins. in diameter, consists of a solid forging in one with the shaft, and the winding is embedded in slots accurately machined on the periphery. The exciting coils are of thin, flat copper strip, arranged on the flat both in the slot and beneath the end covers. The capacity of each exciter is 14.5 kw. The net weight of each alternator is approximately 16 tons. The machines are designed to give their rated outputs with a temperature rise not exceeding  $40^{\circ}\text{C}$ . after continuous running. The condensers have 2,150

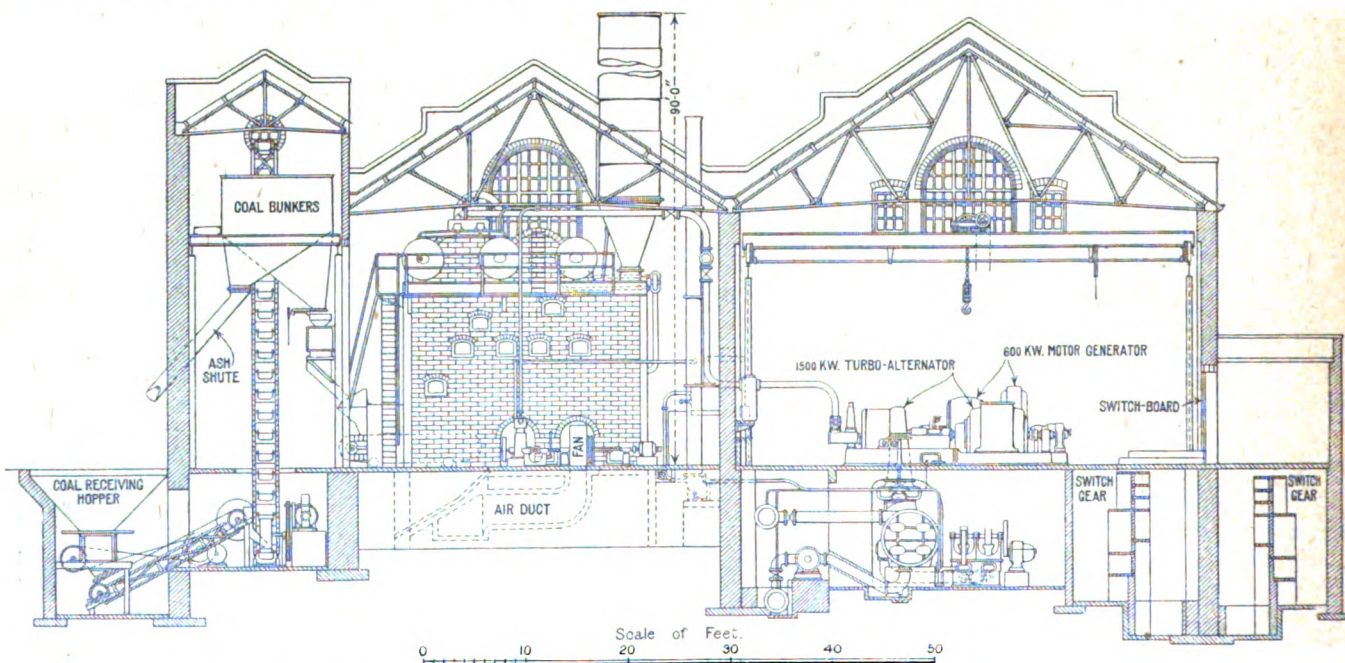

FIG. 3.—SECTION OF NEW POWER HOUSE THROUGH BOILER HOUSE AND ENGINE ROOM.

elevation devoid equally of superfluous ornament and ugliness, and extensive use is made of ferro-concrete in the engine-room floor. Weight-carrying structures are kept as far as possible clear of the walls, even to the length of carrying the traveller gantry on separate columns. Steel con-

tubes each, and are capable of condensing 25,000 lb. of steam per hour with a vacuum of  $27\frac{1}{2}$  ins., with circulating water at  $80^{\circ}\text{F}$ . The pumps are driven by alternating-current motors.

The only other plant is the pair of 600-kw. single-phase

# COUNTY BOROUGH OF STOKE-ON-TRENT

## ELECTRICITY SUPPLY DEPARTMENT.

The whole of the switchgear required for linking up the various stations in the County Borough of Stoke-on-Trent, including new switchboards and extensions to existing switchboards.

Two 600-kw. rotaries, complete with A.C. boosters, exciters, and starting motors.

Two 300-kw. rotaries.

Field rheostats and starting rheostats in connection with these rotaries.

Two 750-k.v.a. OISC transformers and switchgear.

Two 360-k.v.a. OISC transformers and switchgear.

SUPPLIED BY

## THE BRITISH WESTINGHOUSE

— ELECTRIC & MANUFACTURING CO., LTD., —

TRAFFORD PARK,

MANCHESTER.

alternators, running at 600 r.p.m., driven by induction motors, which form the sub-station plant already referred to, and were also made by Siemens Bros. Dynamo Works, Ltd., and a small motor-generator for battery charging purposes made by Bruce Peebles and Co., Ltd. The battery in question has a capacity of 270 ampere-hours and was supplied by the D.P. Battery Co., Ltd. It is placed in a room over the office and lavatories at the far end of the building, and is used for operating the switchgear trips and supplying the station lighting and certain motors in case of emergency.

The appearance of the switchboard is one of the most striking

basement under the switchboard, which is not really underground and can thus be well lighted by windows. The position of the switchcells is shown in the section. The basement also contains the air filters for the generators, the transformers for works service already mentioned, and the bank of resistances through which the neutrals of the generators are earthed. Switches are provided in connection with this so that only one machine is earthed at a time.

Behind the power house on the side further down the hill is placed the cooling tower (by the Davenport Engineering Co.) One will be provided for each generating set. The con-

FIG. 4.—VIEW OF ENGINE ROOM SHOWING POSITION OF SWITCHBOARD; THE MOTOR GENERATORS WITH THEIR LIQUID STARTERS ARE IN THE FOREGROUND, AND ONE TURBO-GENERATOR ON EXTREME RIGHT.

features of the engine room. The vertical slate control panels are let into openings under the windows so as to be flush with the wall, and the switchboard platform, instead of being in a high gallery, is only raised 15 in. above the main floor by two steps. It has no rail, and access can be had to any part of it immediately from the engine room. The familiar high switchboard gallery was perhaps originally due to the use of tall reciprocating engines, with which it was necessary to ensure a commanding view of the engine room, but there is no reason why it should survive in turbine stations. The whole of the switchgear was supplied by the British Westinghouse Electric and Manufacturing Co. The actual switchgear is contained in cells below the engine-room floor level, and only instruments and control gear are mounted on the board. The sets of panels are five in number, arranged in the following order from left to right: generator panels, bar coupling and summation panel, H.T. feeder panels, motor-generator and works panels and L.T. battery and motor panels. Of individual panels there are twenty-five. A Brown-Boveri automatic voltage regulator is provided for the main generators, and it may be mentioned here that the generator protection will be on the Merz-Price system, but the pilot cables have not yet been provided. There is an ample passage-way behind the board, and the connections are arranged in a neater and more accessible way than we can remember having seen elsewhere. The works switchboard is situated in this space behind the main board immediately above the transformers, to which it is connected. Owing to the situation of the building on a hill it has been possible to obtain a deeper basement under the engine room than under the boiler house without much excavation, which is convenient for the accommodation of the condensing plant, and a still deeper

condensing water is drawn from the adjoining canal, and very complete straining arrangements with Bracket screens are provided in a screen house on the bank.

In concluding the description of this interesting station, we wish to express our thanks to Mr. C. H. Yeaman, Electrical Engineer to the Borough of Stoke-on-Trent, who is responsible for the design of the station, for facilities afforded to our representative on the occasion of his visit to the works, and for putting drawings of the station at our disposal.

**The Institution Council Election.**—We regret that the name of Mr. E. Russell Clarke, who is nominated for the new Council of the Institution of Electrical Engineers, was given in error as Mr. E. Clarke Russell, on page 183 of our last issue.

**Standard Street Lighting Specification.**—A Paper on the work done by the Joint Committee of the Institution of Electrical Engineers, the Institution of Gas Engineers, the Institution of Municipal and County Engineers, and the Illuminating Engineering Society, in connection with a standard specification for street lighting, will be read by Mr. A. P. Trotter at the Society of Arts on Tuesday next, at 8 p.m. It is intended to stimulate and to continue the discussion of the general principles on which the specification should be based. We understand that the Paper will be frankly controversial, and it has been decided that, in order to allow time for the fullest discussion, the Paper will not be read. Those who desire to attend the meeting should therefore obtain copies in advance; they may be obtained from Mr. L. Gaster (Hon. Secretary of the Illuminating Engineering Society), 32 Victoria Street, S.W.

## PARIS MEETING OF THE INSTITUTION OF ELECTRICAL ENGINEERS

THE provisional programme of the visit to be paid by the Institution of Electrical Engineers to Paris at the invitation of the Société Internationale des Electriciens on May 20th to 24th, has now been issued. Ladies are invited to take part in the meeting.

The party will travel on Tuesday, May 20th, by the 11 o'clock service via Calais, and the inaugural meeting will take place on the following morning at the Conservatoire des Arts et Métiers, where there will be a discussion on the electrification of railways, and opportunity will be given to inspect the exhibits at the Conservatoire. For the afternoon two alternative visits have been arranged: one party will be taken by motor omnibuses to the generating stations at St. Denis and Asnières of the "Electricité" and "Triphasé" companies, while the other will take steamboat to St. Cloud and visit the Sèvres Porcelain Factory. In the evening a reception will be given by the Société Internationale des Electriciens, at which a cinematograph demonstration will be conducted by M. Gaumont.

At Thursday morning's meeting there will be a discussion on long-distance transmission of electrical energy by (a) continuous current, Thury system (Paper by Mr. J. S. Highfield), and (b) three-phase current (Paper by M. Maurice Leblanc). For those not attending the meeting a visit to the Aerodynamical Laboratory of Mr. Eiffel, at Auteuil, under the guidance of M. Eiffel, has been arranged, and alternative visits to the Louvre, the conciergeries, Notre-Dame, the Sainte Chapelle and other places of interest, are suggested. In the afternoon, M. Eiffel will receive the visitors at the highest platform of the Eiffel Tower, and an inspection of the wireless installation will be made. A visit to the Invalides will also be made. An alternative visit will be to the electrical installations of the Metropolitan, the Nord-Sud and the Compagnie des Omnibus. On Friday the discussion on long-distance transmission will be continued, and alternative visits to the Louvre, the Panthéon, the Luxembourg and the Musée de Cluny; the Conciergerie, Notre Dame and the Sainte Chapelle, or to other places of interest, are suggested.

On Saturday a Paper will be read by M. Claude on "Lighting by means of Vapour Tube Lamps," with experiments, and a lecture will be given by Commandant Ferrié on "Wireless Telegraphy." The alternatives for the morning will be visits to the Louvre or to the Panthéon, the Metropolitan and the Musée de Cluny. The afternoon excursion will be by motor-omnibus to Versailles, where the palaces and the park will be visited, and tea will be taken at the Trianon. Afterwards a visit will be paid to the Aerodrome at Buc, and at the Gare de Versailles, before the return to Paris, an inspection will be made of the new electrical rolling stock of the Ouest-Etat Railway. The official visit will terminate on Saturday evening, but doubtless many will remain in Paris over the week-end. Special railway arrangements have been made, and the fee for those taking part will be £5 5s., which will include 1st-class return fare from London to Paris and the expenses of the excursions and visits. Members will make their own hotel arrangements and are advised to book their rooms well in advance. The reception bureau of the Société Internationale des Electriciens will be at the Hôtel Continental.

**Diesel Engines.**—A Paper entitled "Some Notes on the Design and Economy of Diesel Oil Engines" was read by Captain H. Riall Sankey before the Association of Engineers-in-Charge on April 9th. Comparing the cost of running Diesel engines with other prime movers, the Author pointed out that the condensing steam engine can for short periods give as much as 50 per cent. above the rated power, while non-condensing steam engines and the Diesel engine can give 10 per cent., but the gas engine can usually only do its rated power for short periods, and about 85 per cent. continuously. Taking the case where an average load of 200 h.p. and a maximum of 300 for short periods is required, and the total running hours 3,000 per year, the following total annual costs were given:—non-condensing steam plant, £1,445; condensing steam plant, £1,056; oil engine, £1,055; gas-engine suction producer, £1,006; gas-engine pressure producer, £996; Diesel engine, £932; overtype superheated condensing plant, £879. In this connection interest on capital was taken at 5 per cent., and stores, labour, maintenance, repairs, and depreciation and fuel cost were taken into account. The latter costs per ton were taken as: oil, 42s.; coal for pressure producers, 18s.; coal for suction producers, 28s.; coal for steam boilers, 18s. Only 120 tons of fuel are required for the Diesel engine, while 1,022 tons are required for the non-condensing steam plant.

## THE NEW EXAMINATION SCHEME OF THE INSTITUTION OF ELECTRICAL ENGINEERS

ON and after June 1st, candidates for election or transfer to the class of Associate Member will (unless they hold a British University engineering degree or a diploma from certain technical colleges) be required to pass a written examination or to present a thesis upon which they may be orally examined. The examinations will be held twice a year, in April and October, in London, and possibly in other centres. The entrance fee for the examination will be £2 2s. for the first entry (except for students who have paid at least three annual subscriptions, who will be charged £1 1s.), and £1 1s. for any subsequent entry. Applications must be sent in not later than March 1st for the April examination, or not later than September 1st for the October examination. The first part of the examination will consist of an English essay or a translation into English of passages in French, German, Italian or Spanish, and papers on applied mechanics and either elementary physics or chemistry. The second part will consist of two papers on one of the following subjects: electricity supply, electric lighting and power, electric traction, telegraphy, telephony, application of electricity to mines, electro-chemistry and electrometallurgy, manufacture of electric machinery (including works management), or design of electric machinery and apparatus. The papers in Part II. will include optional questions on administrative and economic matters. A British University Science degree will exempt from Part I.

## RECENT DEVELOPMENTS IN THE STREET LIGHTING OF MANCHESTER

THE Paper on this subject by Mr. S. L. Pearce and Mr. H. A. Ratcliffe, read at the London meeting of the Institution of Electrical Engineers on March 6th, and already discussed in Manchester and Birmingham (see ELECTRICAL ENGINEERING, March 13th, p. 141, and March 20th, p. 162), was discussed by the Scottish Local Section at Glasgow on March 18th.

Mr. R. B. Mitchell spoke in favour of lowering gear and automatic switching as adopted in Glasgow as minimising the attendance required, and referred to the falling off in candle-power of high-pressure gas mantles. He did not think that the effect of glare with clear glass globes was as serious as had been made out, but regarded clear globes with the lower surface only obscured as inevitable in view of the competition to be faced. With dioptric inner globes fumes condensed on the cold surface of the outer globe, and in a very short time obscured it.

Mr. A. Wilson (General Manager, Glasgow Corporation Gas Department) said that the falling off in candle-power of gas mantles had been greatly overrated. In arc lighting the candle-power also varied a great deal. Apparently the poorer results with the gas lighting in Manchester were due to excessive leakage, and to the lamps not having been adjusted to suit the Manchester conditions. They were not satisfied in Glasgow with 60 c.p. per cub. ft. per hour. In several ways, the costs at Manchester seemed high.

Mr. J. S. Roberston (Burgh Electrical Engineer, Greenock) referred to the want of a standard street lighting specification. Arc lamps were better adapted to lowering gear than gas. He was not sure, after all, that centre suspension was best from the point of view of the traffic. He thought that, if anything, the authors had overstated the cost of current.

Mr. S. B. Langlands (Inspector of Lighting, Glasgow) put the deterioration of gas mantles at 17 to 19 per cent., and expressed a preference for laboratory rather than street tests of lamps.

Both Mr. Pearce and Mr. Ratcliffe were present, and replied briefly. An interesting point brought out by Mr. Pearce was that the life of the gas mantles depended largely on the nature of the traffic and the vibration arising therefrom.

**The Strength of Metal Filament Lamps.**—The General Electric Co., Ltd. (67 Queen Victoria Street), send us an illustration of a lantern containing a 100-volt, 20-watt Osram lamp which met with an accident and dropped from its position on to a stone floor, a distance of 17 ft. The framework of the lantern was bent out of shape and badly damaged, but the Osram drawn-wire lamp, which had fallen with it the entire distance of 17 ft., was found to be in perfect condition, and when tested instantly lit up. Another interesting case has been furnished to them by Messrs. Henry Wallwork and Co., of Manchester. In their lighting installation they use 200-watt Osram drawn-wire lamps suspended from special fittings. Through some defect in the holder of one of the fittings, arcing set up, which burned away the barrel of the holder, causing the Osram lamp to drop to the bottom of the glass globe. The lower portion of the globe was broken, but sufficient glass remained to keep the lamp from falling further. On examination this lamp has also been found to be intact, with the exception of a slight defect in the cap.

### WITTON-KRAMER TUBE CLEANERS

FOR some years now the Witton-Kramer Electric Tool and Hoist Co., of Witton, Birmingham, for whom the General Electric Co., of 67 Queen Victoria Street, London, are the sole selling agents, has been turning out electrically-driven tube cleaners. A recent example, which was built to Admiralty specification, is shown in the accompanying illustration. In the Witton-Kramer tube cleaners the portable

WITTON-KRAMER TUBE CLEANER, SHOWING WATER-CARRYING TUBE ALONG SHAFT.

motor may either be accommodated on a small truck or be equipped with eyebolts for chain or rope suspension. In the present example the latter design was specified. The motor and starter are combined, the starter being found at the back of the motor shell. The motor is of 1.5 h.p. 110 volts, and works at 1,500 r.p.m., but the speed of the flexible shaft is reduced to the required working speed by machine-cut, case-hardened steel gearing running in oil. To the slow-speed spindle of this gearing is attached the flexible shaft, which consists of a central core of steel wire wound in alternate directions. Special end-bearings to the shaft are provided. As to the cleaner head, this is of the George and Dormoy patent type, and consists of three groups of cutters arranged conically, sloping away from the shaft. The cutters are held in a frame, and successive cutters have teeth of unequal pitch. The scale is attacked gradually along the conical surface, so that the work is evenly distributed amongst the cutters. Springs press the cutters against the scale and permit them to pass round curves and to do their work, in spite of the tube being flat or oval. It is important to distinguish between a cutter head of this pattern and one which relies on centrifugal force for its cutting action.

### DIMMERS FOR CINEMATOGRAPH THEATRES

THE effect on the eyes of the sudden turning up of the auditorium lights after the comparative darkness during the entertainment is most trying, and the special type of "dimmer" which the Adams Manufacturing Co., Ltd., have produced to enable the change from darkness to light to be made gradually should be very welcome. They can be arranged so that the same movement which gradually brightens the white light will also gradually dim the red light, or vice versa. The dimmers occupy very little space and can be mounted within the operator's cabin.

Each dimmer consists simply of a resistance plate on a soapstone base in an iron housing, with a large number of contacts, and an operating handle arranged with an "off" as well as a "full on" position. The resistance material (which consists of wire or tape of various alloys, according to the ampere capacity and ohmic resistance required) is placed in slots cut in the soapstone and connected at various points to contacts attached to the soapstone base. The whole of the resistance is then hermetically sealed by filling the slots in which it is placed with a patent fireproof cement, which, when set, practically amalgamates with the soapstone. The terminals are bolted into the soapstone and attached to

the resistance material by means of conductors embedded in the soapstone like the resistance material itself. The contact lever is carried on a hub post bolted into a central hole in the soapstone. It will be seen that the soapstone forms an insulating and protecting base, and further mechanical protection is provided by the iron housing, which is further insulated from the soapstone base by means of mica. This housing has ventilating slots so as to permit a current of air to pass over the soapstone base and carry away any heat that may be generated in the resistance. This construction is not only exceedingly robust mechanically, but it is also absolutely fireproof. We are informed that a burn-out of the resistance in one of these dimmers has never yet occurred, but should such a thing happen, there could be no external fire or spark. The rating of the resistance allows ten seconds to dim (or switch off) and ten seconds to raise (or switch on), with an interval of not less than one minute between each of these operations.

### CAST-IRON DISTRIBUTION BOXES

AMONG new designs of apparatus recently brought out by A. Reyrolle and Co., Ltd. (Hebburn-on-Tyne), is the special form of dustproof distribution box illustrated here. This is contained in a cast-iron case and is provided with the Company's patent self-aligning fuse handles, such as have already been described in our columns (ELECTRICAL ENGINEERING, Oct. 5th, 1911, Exhibition Supplement, p. 56). The arrangement of these is such that they are guided by the

shape of the porcelain handle block carrying the fuse clip direct into the contacts, and by their construction thorough ventilation is secured. These boxes can be equipped for S.P., D.P., or T.P. circuits, and in all cases where fuses of different polarity are put into the same box, substantial insulating fillets are interposed between the poles or phases.

DUST-PROOF DISTRIBUTION BOX.

Insulating screens, as shown in the figure, can be fitted if required, and form an excellent safeguard against accidental shocks and burns. The boxes thus meet all the requirements of the Home Office. A watertight form of this box is also made, and simpler forms of interior, with or without switches inside the box, have been standardised as well. Specially arranged bolts draw up the cover in the watertight pattern, and two patterns of gland are used according as the incoming cable is armoured or not. In the former case provision is made for gripping the armouring so as to ensure electrical continuity for the earth connection.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelopes.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,334.

I should be glad if any of your readers would give their experiences of the various kinds of "burglar alarms"—not necessarily confined to the ultimate test—as suited to an occupied house, i.e., where communication with a police station or boy messengers' office is not important. I am aware of the system of "treads" in the floor, working bells and lights by clock-work, which has been satisfactorily tried, but desire to know of any other efficient methods.—"B."

(Replies must be received not later than first post April 17th.)

### ANSWERS TO No. 1,332.

The switch of a 3-phase alternator fitted with discriminating fault protection of the Merz-Price balanced type has been giving considerable trouble by opening repeatedly owing to the action of the relay without apparent cause, as no fault can be discovered in the generator. The relay connections and pilot connections are quite sound and unbroken, and the balance of the current transformers proved sufficiently good right up to short-circuit current, and, indeed, the plant often runs satisfactorily for days without trouble of any kind. The neutral of the alternator, which is in parallel with others, is earthed. "Current" balancing is utilised with a relay across the mid-point of the pilot. The current transformer secondaries are both star-connected and their neutrals earthed, and there are no overload or time-limit fuses. What is the cause of the trouble?—"KINK."

The first award (10s.) is made to "S.F." for the following reply:—

The trouble experienced is doubtless due to the fact that the neutrals of both sets of current-transformer secondaries are earthed instead of one set only, consequently the relay circuit will pick up stray earth currents and operate the oil-switch. The neutral point of one set of transformers will doubtless be connected to the main earth plate, to which all the fault currents of the system will flow, whilst the neutral point of the other set of transformers may be earthed some distance away. There will therefore be a difference of potential between these two points, which will upset the balance in the relay circuit. It must be remembered that the relay is set very light and will operate with a fraction of an ampere, so that even feeble stray currents are sufficient to cause the trouble. Merz-Price relays have also been known to operate when a machine is being synchronised, provided the neutral points of the incoming and running machines are both earthed. Earth cross-currents pass under these conditions, and have the same effect as "fault" currents mentioned above. Fig. 1 shows how the connections should be made with the neutral of the secondaries earthed at one point only, and an insulated copper connection coupling up the neutrals of the two sets of transformers. The latter connection is important, as, if it is deleted, the relay is liable to operate when faults occur external to the generator for the following reasons. (1) In

the event of a fault developing on some part of the system, current will return to the generator by a fourth path, i.e., via the earth connection. (2) With no fourth wire in the secondary circuit the secondary currents are no longer fac-similes of those in the primary, since the sum total of the secondary currents in either direction must be zero at every

FIG. 1.

FIG. 2.

instant, whilst this is obviously not the case with the primary currents. As the primary and secondary currents no longer balance, it follows that considerable differences of potential exist at the transformer secondary terminals and consequently between the secondary leads, with the result that the relay operates. Fig. 2 shows single-phase connections with one terminal of each current transformer earthed. It is at once obvious that a portion of the "earth" current would pass through the relay.

The second award (5s.) is made to "M.P.," who writes as follows:—

Your correspondent's trouble is due to the fact that he has the star points of the secondaries of both sets of series transformers earthed. A path is thus laid open for stray earth currents to pass in at one earth connection and out at the other via the series transformers, pilot wires and relays. The effect is more pronounced if the two sets of series transformers are far apart. The earth currents may be due to the system itself or to any other whose route lies across the path of the protective gear. If, therefore, your correspondent will disconnect the earth wire on one of the sets of series transformers, leaving the star point of the other set still earthed, the path will be broken and the trouble overcome. The writer had an almost parallel case with a feeder in the early days of Merz-Price gear.

**The Association of Consulting Engineers.**—We have received a copy of the report of the committee of this association for the year ended December 31st, 1912. The history of the inception of the association, which is familiar to our readers, is outlined, and a list of the committee elected at the first meeting of duly enrolled members, in July, 1912, is given, together with extracts from the draft memorandum and articles of association defining the qualifications and duties of members. The formalities connected with the registration of the association are, however, not yet complete. The Association has been invited to participate in an International Congress of Consulting Engineers and Engineering Experts at Ghent, where the formation of an International Federation of Association of Consulting Engineers will be considered. Up to the present, between eighty and ninety eligible candidates have applied for membership. The committee has already taken action with reference to one or two competitive tenders where the conditions were thought unsatisfactory, and has been giving consideration to the standard clauses of contract prepared by the B.E.A.M.A., but report that they are of opinion that "it is not possible to frame one set of conditions applicable to all contracts, and that it must be left to the independent judgment of individual engineers and their legal advisers to decide what conditions are best suited to any particular contract." With reference to requests that a standard scale of professional fees should be drawn up, the committee express the opinion that "it would not be advisable to attempt to stereotype rates of remuneration." Other matters referred to in the report are the question of Government officials acting as consulting engineers, and the taxing of engineers' fees in law cases. "It cannot," says the report, "be too widely known that the decision of a taxing master is only as between party and party, and that he has no authority to say what the parties shall pay their engineering advisers." A separate pamphlet, entitled "The Professional Rules and Practice of Members of the Association of Consulting Engineers," is being issued.

# "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

## Specifications Published April 3, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

6,212/12. **Pressure Regulation of Distributing Systems.** B.T.-H. (*G.E.C., U.S.A.*). As applied to a three-wire system each dynamo or balancer has in the field circuit a resistance which is short circuited through a relay controlled by another relay with two balanced windings, one across each outer and the neutral. It is thus arranged that one resistance is in circuit while the other is out, so that rapid following of load variations is possible. One figure.

6,599/12. **Automatic Attachment for Motor Starters.** W. A. CLATWORTHY. To a pivotted lever is attached a weight or spring, and a movable detent. A pivotted quadrant has a notch or projection for engaging the detent, and is attached to the motor-starter, of the ordinary non-automatic kind, by a flexible coupling. A pivotted tripping arm is also provided for tripping and maintaining the detent in its non-engaging position. The pivotted lever and tripping arm are manually operated in one direction only. It is suggested that a suitable application of this gear would be to a hoist operated through fast and loose pulleys, and where the starter may be operated for starting and stopping by unskilled persons from different floors by a rope. Four figures.

10,427/12. **Adjustable Frequency Alternator.** J. G. SHAW and C. R. SHAW (Crypto Elec. Co.) and H. G. SHARP. The windings on adjacent poles are connected in a number of groups. One at least is connected with the energising source through a multiple pole change-over switch, so as to form a number of magnetic fields equal to the number of pole pieces, or to the number of pole pieces divided by the number of groups. The armature winding is also wound after the same manner, together with coils having a larger span connected to a change-over switch, so that they may be connected to the main coils. One figure.

10,996/12. **Starter for Internal Combustion Engines.** B. BROOKS and W. HOLZ. To keep the electric starting motor small it drives a flywheel which is connected to the engine, when this is desired to be started, by a suitable clutch. The flywheel itself may form one member of this. Three figures.

12,594/12. **Laundry Irons.** C. KENRICK. A pair of insulated metal plates (cast iron) clamp the leads in contact with the resistor, which is wound on insulating (mica) formers, and inserted between the plates. This element may be inserted in an ordinary design of iron. Five figures.

17,761/12. **High Pressure Insulators.** W. FELLEBERG. To protect insulators of overhead lines from pressure surges and atmospheric discharges occurring simultaneously metallic rings are embedded in the surface of the insulating material so that arcs are prevented from passing inwardly through the insulator body. Their distances apart are such that arcing across will take place before the insulator is submitted to destructive stress. Six figures.

19,787/12. **Rotary Engine and Electro-magnetic Transmission.** A. BELDIMAN. Radial cylinders rotate about a fixed crankshaft. The support connecting the cylinders together forms the armature core of a dynamo, while the motor field magnet is common to that of the dynamo. Two figures.

486/13. **Railway Track Point Working.** J. S. HOLLIDAY (*U.S.A.*). An A.C. repulsion motor is used to work the points. It has two field windings, both of which are connected to a single-phase supply, but one is disconnected when the movement and locking of the gear have been accomplished, and is then connected to an indicator which is operated by current generated by the continued rotation of the motor running as a single-phase induction motor. One figure.

## Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad. Summaries of some of the more important of these patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** HANDCOCK, DYKES and DUDDELL [Control of apparatus and signalling over distributing systems] 6,716/12 and 5,307/13; SCHMID [Selectively operating apparatus] 14,121/12; B.T.-H. (*G.E.C., U.S.A.*) [Circuit protection] 16,708/12.

**Dynamos, Motors, and Transformers:** LEBLANC [Vapour apparatus] 6,655/12; DENNY and EDGEcombe [Collectors for slip-rings] 8,640/12; TATTERSALL [Regulating the output of dynamos] 1,205/13; KETTERING [Differential compound dynamos] 5,545/13.

**Electrometallurgy and Electrochemistry:** MORGAN CRUCIBLE CO., DAVISON and HARVEY [Furnaces] 6,808/12; HELFENSTEIN [Induction furnace] 14,164/12.

**Heating:** MANN [Vacuum electric water-heater] 12,367/12.

**Ignition:** THOMPSON [Spark plugs] 20,248/12.

**Switchgear, Fuses and Fittings:** HATFIELD [Time switches] 6,404/12; MOLLER [Automatic circuit-breakers] 6,990/12; TROOD and DALE [Cable connectors] 9,909/12.

**Telephony and Telegraphy:** CHAMBERS [Wireless] 7,242/12; SCHIESSLER [Production of undulatory currents] 18,655/12; THOMPSON (*Cie Universelle de Telegr. & de Teleph. Sans Fil.*) [Production of high-frequency currents] 24,957/12; EVANS [Transmitting orders, &c.] 26,694/12.

**Traction:** MERZ and REDMAN [Protecting railway conductor rails] 7,591/12; WEENEN, STOFFELS and VAN DER SPENKEL [Controlling tramway points and signals] 19,160/12; SIEMENS BROS. & CO. and FERREIRA [Railway-point detectors] 25,159/12.

**Miscellaneous:** RUMOLINO [Transmitting mechanism for marine engine governors] 6,828/12; HALDEN [Photo-copying frames] 10,183/12; IVINSON and BRYANT [Medical apparatus] 12,757/12; FIELDING [Friction clutch gear for boat hoists] 12,892/12; WILSON [Therapeutics] 16,758/12; EDELMANN [Alarm thermometers] 20,342/12; STIMSON [Automatic fans] 23,576/12; LILJEBLAD and ART. ELEVATOR [Automatic lifts] 23,918/12.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** ENTZ [Automobile engine starting and lighting systems] 25,386/12; SIEMENS SCHUCKERT [Circuit protection] 6,164/13.

**Dynamos, Motors, and Transformers:** HARTMANN [Metal vapour rectifiers] 15,937/12; BERGMANN A.-G. [Reversing polyphase commutator motors] 4,691/13.

**Ignition:** BOSCH [Time adjusting] 4,692/13 and 4,693/13.

**Incandescent Lamps:** JUST [Filament manufacture] 4,034/13.

**Storage Batteries:** SABLON [Tight reversible case] 6,066/13.

**Switchgear:** KRUPP A.-G. [Time switches] 3,825/13.

**Telephony and Telegraphy:** CLAUSEN [Telephony] 15,057/12; TELEPHON APPARAT FABRIK ZWIETUSCH [Automatic switch control] 2,700/13.

**Miscellaneous:** KRUPP A.-G. GRUSONWERK [Magnetic separator] 4,595/13; DES ORDONS [Clock synchronising by wireless] 6,192/13; KRAUS [Electrostatic separators] 6,336/13.

## Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

7,525 of April 10th, 1899. **Submarine Telegraphy.** A. MUIRHEAD. The specification states that the invention is for means for re-transmitting signals without local transmitters. Means are also provided to preserve the zero of the organisation and to improve the character of the local contacts. The signal coil or some part of the receiving circuit is automatically "curbed." The means which impart directive force to the recorder coil of a siphon recorder or other part of the receiver actuated by the cable current are utilised to effect the re-translation. A second coil is mounted in connection with the usual coil of a siphon recorder, and supported by it is a loosely mounted contact tongue which plays between the terminals of a split battery, connected to the second cable. Nineteen figures.

7,892 of April 14th, 1899. **Secondary Batteries.** E. W. JUNGER. The active materials remain the same on charge or discharge. The active material of both electrodes consists of finely divided metals insoluble in the electrolyte (alkaline), or oxides of metals which do not give up free hydrogen when the battery is active. Sodium or potassium hydrates and silver and copper are mentioned. The E.M.F. is 0.95 to 1 volt.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Arc Lamps:** SIEMENS & Co., GEB. [Feeding negative electrode in search lamps] 15,338/07.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** J. W. GREENWOOD and D. E. BROWN [Tell-tale for use in vehicle lighting systems] 28,941/06; E. WEIDINGER and H. KAHN [Insulating material] 23,117/07.

**Dynamos and Motors:** B.T.-H. (*G.E.C., U.S.A.*) [Treating carbon for brushes] 28,062/04; [Squirrel-cage induction motor rotors] 26,137/07.

**Ignition:** J. L. LE PONTOIS [System using inductor alternator and transformer] 26,590/05.

**Instruments and Meters:** CIE. POUR LA FABRICATION DES COMPTEURS ET MATERIEL D'USINES A GAZ [Single-phase induction motor meters] 21,208/03; H. A. JONES and A. FARNELL [Speed indicators and revolution counters] 28,139/07.

**Traction:** B.T.-H. (*P. E. Case, U.S.A.*) [Dead man's handle motor controller] 25,448/99.

**Miscellaneous:** A. DENNY and C. H. JOHNSON [Electro-magnetic torsion dynamometer] 27,842/03.

## DISPUTE BETWEEN SUPPLY COMPANIES

**T**HE appeal by the London Electric Supply Corporation, in the House of Lords, against the Westminster Electric Supply Corporation relating to supply in the Westminster area, has been successful.

In this appeal the London Company sought an injunction to restrain the Westminster Company from conducting the management of the London Company's business in the Westminster area in a way whereby the London Company's business is decreasing in that area. The London Company had deputed the Westminster Company their managers in the Westminster area, under certain conditions, under the powers of the Act of 1909. The first part of the present hearing was reported in *ELECTRICAL ENGINEERING* for Feb. 27th, p. 117, and the process of the case through the Lower Courts may be traced from *ELECTRICAL ENGINEERING*, Vol. VII., pp. 63, 132, 190, and 404.

Sir Robert Finlay, in the course of his speech for the Westminster Company, submitted that under the agreement all old customers of the London Company were secure, but he maintained that no new customer was entitled to demand any special supply of electricity. His contention was that the Westminster Company had become managers, of a very special kind, of the London Company's business in the Westminster area. The London Company supplied alternating current from its mains, and by a Provisional Order obtained in 1908 it could supply direct current, though it had, in effect, only put down machinery for this purpose south of the Thames. By entering into this agreement with the Westminster Company, they were enabled to supply direct current, by purchase from the Westminster Company, as well as alternating current, and since by the same agreement they handed over the management of their business in the Westminster area to the Westminster Company, the latter could supply any consumer in that area, asking the London Company for a supply, with either direct or alternating current as they chose. On his reading of the Act of 1909, a company could take a supply in bulk from another company, who would at the same time act as the distributors of that supply. He also argued that by the Electric Lighting Acts any one resident within 50 yards of a main has a right to apply for a supply, but whether he is supplied from that main or from another rests with the company. On this interpretation the Westminster Company, as representatives of the London Company, were refusing to supply alternating current to consumers demanding it. The Westminster Company admitted that they must fulfil all statutory obligations to the public. They believed that they were doing so at the present time, but if anyone thought otherwise it would be necessary to bring an action against the company through the Public Trustee. The rights of the public did not enter into the present case at all. Mr. Younger, K.C., carried on the argument for the Westminster Company, and Mr. Buckmaster, K.C., replied briefly for the London Company. He confined himself practically to refuting the suggestion made by Sir Robert Finlay that a resident within 50 yards of a main was not entitled to a supply from that main.

The Lord Chancellor, Lord Shaw, and Lord Moulton read judgments in which they traced the progress of the Law on Electric Supply, and showed that the contentions of the Westminster Company were wrong and those of the London Company were right. It was a pity that some of the arguments used in the appeal had not been made in the Lower Courts. It would not, however, be necessary to grant an injunction, as there was no reason to think that the Westminster Company would fail to act in accordance with their obligations now that these were determined. The following were suggested by Lord Moulton:—

(1) That it may be declared that the defendants in managing and working the plaintiffs' undertaking in the Westminster area are bound to do the same with reasonable care and skill and with due regard to the interests of the London company therein.  
(2) That it may be declared that, according to the true construction of the said agreement of May 4th, 1910, the defendants are as between themselves and the plaintiffs bound, if required so to do by the plaintiffs, to supply electric energy by means of the plaintiffs' alternating current to any consumer or proposing consumer in the Westminster area who applies to the plaintiffs for a supply of electric energy and is entitled to receive from them a supply of the same, and whose application is duly forwarded by the plaintiffs to the defendants for execution, and to do and permit to be done all acts and things necessary for furnishing such customer with the plaintiffs' alternating current.

Lord Atkinson concurred.

## PENDING ELECTRICAL LAW SUITS

**D**URING the Easter law sittings, which began on Tuesday last week, a number of cases of considerable interest to the electrical industry will come on for hearing. There is no lamp patent action set down for trial, although several are pending, and will come on later in the year if not settled previously; in the meantime, there are certain to be a number of "interlocutory motions" with regard to evidence, procedure, &c. One of these is Osram Lamp Works, Ltd., v. Gabriel Lamp Co.

An extremely interesting wireless telegraph patent action is likely to be heard shortly; although it is not down on the first list for the Easter sittings, it may come on later, and, at all events, should be down for hearing during the Trinity sittings. It is brought by the Marconi Co. against the Helsby Wireless Telegraph Co., Ltd., alleging infringement of the famous patent 7777/1900. The Helsby Co. are employing the "quenched spark" method (the Lodge-Chambers system), and it appears that the Marconi Co. claim that this infringes their fundamental patent. The defendants will plead that they do not infringe, and will also claim that the patent is invalid for want of novelty, subject-matter and insufficiency of specification. The Council retained in the action are Mr. J. M. Astbury, K.C., Mr. A. J. Walter, K.C., and Mr. J. Hunter Gray for the Marconi Co.; whilst Mr. H. A. Colefax, K.C., Mr. Courtney Terrell and Lord Tiverton will appear for the Helsby Co.

Application is to be made before Mr. Justice Sargant for an extension of term beyond the usual maximum life of fourteen years of patent No. 8961/99, granted to Valdemar Poulsen and assigned to the Telephonograph Corporation (of New York). The patent is for the "telegraphone," which is an instrument for storing telephone or other messages or signals by subjecting moving steel wire to magnetic influences controlled through an electro-magnet by the signalling currents. To reproduce the signals the instrument is put in connection with a telephone receiver, and when the wire is set in motion the message is reproduced by the receiver. The action will not come on before April 14th.

As mentioned in *ELECTRICAL ENGINEERING* for March 20th, p. 165, both the National Telephone Co. and the Post Office are appealing against the award of the Railway and Canal Commissioners as to the value of the former's undertaking taken over by the Post Office. The Post Office are appealing against the cost of obtaining subscribers' agreements and the cost of raising capital being allowed. The National Co. are appealing against the whole award, and in particular against the method adopted in the award of calculating depreciation. Tuesday, April 15th, has been fixed for the hearing of the appeal.

Before the Divisional Court there will be some questions of law argued, arising out of the recent arbitration between the London United Tramways and the London County Council Tramways, for the acquisition of the short length of the Company's lines in the County of London at Hammersmith.

Among other actions likely to be of interest to our readers may be mentioned one by the Western Electric Co. against the Great Eastern Railway Co., which raises an interesting question as regards the insurance of goods carried by railway companies. The Brimsdown Lamp Works are suing Messrs. Halle and Co. for goods sold, and the action *Hurlston v. London Electric Railway Co.* is for personal injuries.

**The Iron and Steel Institute.**—The annual meeting is to be held at the Institution of Mechanical Engineers on May 1st and 2nd, and the annual dinner will take place on May 2nd. Among the papers to be discussed is one on "A new form of electrically-driven, two high continuous-current, reversing mill," by Mr. A. Lamberton. The autumn meeting will be held at Brussels from September 1st to September 5th.

## PHENIX ASSURANCE COMPANY, LIMITED.

ESTABLISHED 1782.

Head Offices: 19 & 70, LOMBARD STREET, LONDON, E.C.

TOTAL FUNDS EXCEED

### TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The first issue of the *Wireless World*, which is our old friend the *Marconigraph* in altered form, has been sent us. The magazine will be devoted to the advances of the Marconi system throughout the world, and to wireless telegraphy in general, as was its predecessor, but will also make a special feature of encouraging wireless telegraphy for national defence, and, in particular, the training of boy scouts and other boys' brigades, in wireless telegraphy, to further which the Marconi Co. are organising a system of special instruction. Special articles of an elementary nature will appear in connection with this scheme month by month, and the interests of the amateur as well as the professional radio-telegraphist will be studied. In the present issue we may call attention to a special article by Mr. J. S. Stone on "The Practical Aspects of the Propagation of High Frequency Electric Waves along Wires," one by Mr. H. Smith on "The Use of a Condenser as a Shunt to a Telephone," and an illustrated description of the Aden-Berbera wireless stations. The equipment of the iceberg patrol boat *Scotia* is also described. An excellent portrait of Mr. G. Marconi forms the frontispiece.

The New York-San Francisco telephone line referred to in *ELECTRICAL ENGINEERING*, Jan. 23rd, p. 53, will, says the *Hamburger Nachrichten*, run via Denver and then along the Central Pacific Railway. The total cost is estimated at £420,000, and the charge for a one-minute's conversation will be eighteen dollars, or about £3 15s.

The Technical Committee appointed by the Select Committee of the House of Commons in connection with the Imperial wireless telegraph scheme, inspected the Poulsen station at Copenhagen on Friday.

Following the withdrawal of Mr. Harold Smith from the Select Committee of the House of Commons which is inquiring into the Imperial wireless telegraph contract, Mr. Henry Terrell and Mr. Gordon Harvey have also resigned. In the case of Mr. Terrell, however, business reasons have compelled

him to take this step. Sir Frederick Banbury, Mr. J. G. Butcher, K.C., and Sir W. Essex have been nominated to fill the vacancies. Since our last issue evidence has been given before the Committee by stockbrokers. It is expected that the report of the Expert Committee will be presented by the beginning of next month.

In an article in the *General Electric Review* (New York) examples are given of disturbances on residence lighting circuits fed from overhead wires due to induction from neighbouring wireless stations. A number of tests have been made to determine the value of the induced potentials, which in some instances taken from practice amounted to over 500 volts. A number of wires connecting up with fittings, &c., were fused. It was found that by entirely enclosing the wiring in metallic sheathing, earthed at frequent intervals, the trouble was prevented. Alternatively the aluminium cell lightning protector placed across the terminals of the apparatus to be protected, and having short earth connections, was found to be admirable for D.C. circuits, but owing to its short life in A.C. circuits its use is not warranted unless the apparatus to be protected is of considerable value and the arrester is capable of frequent inspection. High non-inductive resistances connected between the line and earth were also tried with some success, but for satisfactory working it was found that the energy loss was considerable. The recently developed vacuum-tube lightning arrester was also successfully used. These arresters consist of a  $\frac{3}{4}$ -in. gap between a disc electrode and the inner wall of an exhausted metal tube. The spark potential is 300 to 550 volts D.C. or 200 to 400 A.C., and on A.C. circuits gives entirely satisfactory protection. A low series resistance should be used or the line fuses between the arrester and source of energy should be omitted, as the dynamic current sometimes follows heavy static discharges for half a cycle.

The Chio-Tenedos cable was down on 1st April, and telegrams for Tenedos and Lemnos, Salonika and district could only be accepted "via Eastern" at sender's risk, and with delay. The Bagdad-Bassorah line was down on the 3rd inst. and up again on the 4th inst., and on the following day the Chio-Tenedos cable was put through again.—Offices have been opened at Adrianople and Baba Eski, and telegrams

are transmitted via Bulgaria. The Djedda-Souakim cable was repaired on the 7th inst., and on the 8th communication was down with Bucio, Balombo, Quimbale, Bailundo and Bihé in Angola.—The Direct United States cable, which has been down some time, is now engaging the attention of a London repairing ship, the *Dacia*, of Silvertown. The break is understood to be in deep water.

## ELECTRIC TRACTION NOTES

Two petrol-electric motor-cars have recently been put in service on the Chicago, Milwaukee & Puget Sound Railway. The cars, 27 ft. 5 in. long, do 70 and 124 miles per day respectively, though much greater distances were covered on test. An eight-cylinder, four-cycle "V" type engine is direct-connected to a 600 volt commutating pole generator. An auxiliary hand-started equipment is also provided to start the main engine, and to run the lighting generator. The petrol tank under the car stores 150 gallons.

The annual report of the Liverpool Corporation Tramways Manager for 1912 shows that, after meeting interest and sinking fund charges, a sum of £66,929 is available for reserve, renewal, and depreciation, and a similar amount has been handed over in relief of rates. The net profit shows an increase of £19,126 over 1911. Satisfaction is expressed in the report on the working of the Stevens petrol-electric omnibuses, which are being used on some of the outlying routes.

The Bournemouth Tramway Manager proposes to run a service of trolley omnibuses along the front from Bournemouth to Boscombe. The estimated cost is £13,800, and a profit of £1,500 per annum is anticipated.

The Chief Railway Commissioner to the Victorian Government has been granted a five months' leave of absence to tour Europe and America to study electric railway work.

It is proposed to substitute storage battery for horse-drawn cars on the Belt Line Railroad of New York.

## LOCAL NOTES

**Aberdeen: Power Supply.**—Mr. J. A. Bell, the City Electrical Engineer, has recommended that a supply of electrical energy for power purposes be given to the Broadford works at the flat rate of  $\frac{1}{4}$ d. per unit. There was considerable discussion at the last meeting of the Electricity Committee when this proposal came up, and eventually a resolution to refer the matter to a sub-committee, with power to call in advice, was carried by 5 votes to 4.

**Accrington: Supply in Rishton.**—The Corporation having received an application for a supply of electrical energy to the works of Messrs. Peebles and Sons in Rishton, it has been decided, owing to the District Council having refused their consent, to apply to the Board of Trade for a license under their Electric Lighting Act of 1909.

**Banbridge: Electricity Supply.**—A Board of Trade inquiry was held last week with regard to an application by the Council for an electric lighting provisional order.

**Coventry: Electricity Extensions.**—In the Corporation's Omnibus Bill, which was before the House of Commons last week, powers were sought to extend the area of electricity supply into a number of surrounding districts. There was, however, opposition by the Warwickshire County Council and the Leicestershire and Warwickshire Electric Power Co., the former in respect of the interference with roads, and the latter on the ground of competition in an area where Parliament had already granted them powers. Eventually the Corporation withdrew a number of the areas, but wished to retain the parish of Stoneleigh, but this concession did not remove the opposition of the Power Co., which, by the way, has recently been taken over by the Tramways, Light and Power Co., the promoters of which are Messrs. Balfour Beatty and Co. The case for the Corporation in reply to this opposition was that the Power Co. have only powers to supply in bulk in this area, and that their power station is many miles away from it, the inference being that it would be many years before the district would receive a supply from the Power Co. The Committee, however, granted the extension to the Corporation with the reservation that the Power Co.

should not have to seek the consent of the Corporation, as is the case in the City of Coventry, before it can make any arrangement to supply in the added area.

**Dublin: Electricity Profits.**—The Electricity Committee has recommended that £1,000 be transferred to the relief of rates from the electric lighting profits, and not £5,000, as was suggested by the Finance Committee.

**Leeds: Motor Hiring.**—At the last meeting of the Council the Tramways and Electricity Committee recommended that the further consideration of the recently proposed scheme for motor hiring should be deferred. An amendment to refer this back, however, was subsequently passed in order to give consideration to a certain letter which, it was stated, contained grave charges against the officials of the Electricity Department, in regard to pushing the sale of certain makes of motors to the prejudice of others. The sub-committee concerned with the question will now investigate these charges.

**Sheffield: Rateable Value System of Charging.**—Mr. S. E. Fedden, the Manager of the Electricity Department, has proposed the adoption of the rateable value system of charging for private house supplies on the basis of a fixed annual charge of 10 per cent. on the assessment, plus  $\frac{1}{4}$ d. per unit.

**Stockton: Bulk Supply.**—Terms have been arranged between the Cleveland and Durham Electric Power Co. for a supply of power between 10 p.m. and 6 a.m., or, alternatively, between 6 p.m. and 6 a.m. The Power Co. will lay the mains within 300 ft. of the Corporation works. The terms are said to be practically equivalent to the Corporation's own works costs, with the advantage that no new plant will have to be installed.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Accrington.**—A loan of £2,000 is to be applied for in connection with a supply to Messrs. Peebles' works in Rishton.

**Australia.**—The Melbourne Electric Supply Committee require high-tension alternating-current switchboards. Messrs. Mellwraith, McEachern and Co., Biliter Square, E.C.

**Bradford.**—Three-phase and continuous-current switchgear for two sub-stations. April 17th. City Electrical Engineer. (See advertisement on another page.)

**Bootle.**—A loan of £3,750 is to be applied for in connection with new generating plant.

**Dublin.**—High and low-tension switchgear, cables and accessories. City Electrical Engineer, April 24th. (See advertisement on another page.)

**Earlstown.**—Messrs. McCorquodale and Co. contemplate the installation of a private electricity generating plant.

**Halifax.**—A loan of £18,180 was required into last week. Of this, £5,000 is required for mains.

**Leeds.**—Sanction to a loan of £186,500 is to be applied for. Of this, £38,500 is for additional plant; £100,000 for mains; and £30,000 for sub-stations and equipment.

**Macclesfield.**—The New Macclesfield Electricity Co. has purchased a site for a generating station.

**Manchester.**—Extra high-tension switchgear; low-pressure steam and water pipes, &c.; two 50 h.p. three-phase motors for cooling towers. Chairman of Electricity Committee, April 23rd. (See advertisement on another page.)

**Mexborough.**—An inquiry was held last week concerning a loan of £11,500 for extensions at the electricity works.

**Newcastle-under-Lyme.**—An expenditure of £2,000 is contemplated for mains extensions.

**Newport (Mon.).**—An expenditure of £25,000 is to be incurred on new generating plant.

**Stockton.**—A new rotary-converter is required by the Corporation.

**Stoke-on-Trent.**—A loan of £8,000 is to be taken up for extensions of mains to Fenton.

FOR  
STEAM JOINTS  
USE

JOHN HUDSON & CO.'S SUCCESSORS, Mansell St., London, E.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Aberdeen.**—New buildings for Technical College, costing £60,000.

**Blackburn.**—New municipal buildings to cost £120,000.

**Coatbridge.**—Cinematograph theatres in Main Street and Bank Street.

**Greenock.**—Cinematograph theatre in Rue End Street.

**Knotty Ash.**—Clerk to Vestry, Brownlow Hill.

**Liverpool.**—Electrical installation at Highfield infirmary.

New public baths costing £70,000.

**London.**—Alterations to Devonshire Club, St. James's Street, costing £7,000.

**Newcastle-on-Tyne.**—Public baths at Benwell, Walker and Heaton. Town Clerk.

**York.**—Elementary school in Campleson Lane. Secretary, Education Offices.

### Miscellaneous

**Bedford.**—A twelve months' supply of carbon and metallic filament lamps. Borough Electrical Engineer. April 23rd. (See advertisement on another page.)

**Tasmania.**—The Post Office authorities require large quantities of telephone material. Specification may be seen at 73 Basinghall Street, E.C.

**York.**—The Local Government Board have sanctioned a loan of £500 for the wiring of premises, repayable in ten years.

### TENDERS RECEIVED AND ACCEPTED

**Colchester.**—The tender of Messrs. Chamberlain and Hookham has been accepted for ordinary and prepayment meters.

**London: Battersea.**—The tender of Messrs. Babcock and Wilcox for a water-tube boiler, superheater, chain-grate stoker, &c., at £1,920, is recommended for acceptance.

**Newport (Mon.).**—An order for the supply of carbon-filament lamps and radiator lamps for the next twelve months has been placed with Siemens Bros. Dynamo Works.

**Walthamstow.**—Orders for meters during the next twelve months have been placed with Messrs. Chamberlain and Hookham and Messrs. Ferranti.

**York.**—The following tenders have been received: two water-tube boilers, superheaters and chain-grate stokers. Messrs. Babcock and Wilcox, £4,219; a 3,500-kw. turbo-alternator with condensing plant, Oerlikon Co., £9,967; storage battery and reversible booster, Tudor Accumulator Co., £3,899, with a maintenance charge of £188 per annum for fifteen years.

Orders have been received by the Mirrlees Watson Co., of Glasgow, for surface condensing plants with Mirrlees-Leblanc or Mirrlees-Edwards' air pumps, from the following: County of London Electric Supply; Aberdeen Corporation; Fleetwood Urban District Council; Lancashire Electric Power Co. A large number of orders have also been received for multi-jet and other forms of condensing plant.

Messrs. Siemens Bros. Dynamo Works have received contracts from Messrs. Balfour Beatty and Co. for a twelve months' supply of Tantalum and Wotan traction lamps for the tramways of Luton, Llanelly, Dartford, Carlisle, Leamington and Warwick, and Nottingham and Derbyshire.

### APPOINTMENTS AND PERSONAL NOTES

Mr. F. W. Purse, Chief Electrical Engineer to the Watford Corporation, has been appointed to a similar post with the Carlisle Corporation in succession to Mr. S. T. Allen, recently appointed to Wolverhampton. In addition to Mr. Furness, the short list of candidates included Mr. T. C. Parsons, late Chief Electrical Engineer, Govan; Mr. H. A. Neville, Chief Electrical Engineer, Wakefield; and Mr. B. Sankey, Borough Electrical Engineer, Whitehaven. The commencing salary is £500 per annum. There were 148 applications.

Mr. W. R. May, at present Chief Assistant Electrical Engineer to the Lowestoft Corporation, has been appointed Borough Electrical and Mechanical Engineer, at a commencing salary of £250 per annum, rising to £280. Mr. H. H. Saunders has been appointed General Manager of the undertaking at a salary of £220, rising to £250 per annum.

Mr. G. A. Bruce, who recently resigned the position of Electrical Engineer and Manager to the Lowestoft Corporation, has been presented with an illuminated address by the staff. Mrs. Bruce has also been presented with a pair of silver vases.

Mr. Thomas D'Arcy Nassau, who is at present Resident Engineer to the Honiton and District Electric Supply Co., Ltd., has been appointed Resident Engineer and Manager to the County of Dorset Electric Supply Co., Ltd.

Mr. H. Gray, Borough Electrical Engineer at Accrington, has been granted £50 in respect of extra services in connection with the recent extensions at the electricity works.—Mr. A. W. Clegg, Chief Assistant Electrical Engineer, has been granted an increase in salary of from £200 to £225, with a further increase of £25 per annum.

Mr. W. Baxter, who, as mentioned in our Business Notes, has left A. Reyrolle and Co., was presented before leaving by Mr. Reyrolle with a handsome filing cabinet, which had been subscribed for by members of the staff.

A sub-station shift engineer is required by the Bristol Corporation. (See advertisement on another page.)

Man required for motor-car electric lighting equipments. (See an advertisement on another page.)

Experienced stores clerk required. (See advertisement on another page.)

### MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith and Sons, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £71 10s. to £72. (Last week, £70 to £70 10s.)

**Anderson and Munro.**—We are informed that for the future Mr. Donald Smeaton Munro will carry on the electrical branch of the business, formerly carried on by Anderson and Munro in Edinburgh, under his own name at 11 Randolph Place, Edinburgh.

**Agencies.**—Mr. W. Baxter has resigned his position with A. Reyrolle and Co. and has opened an office at 90 Pilgrim Street, Newcastle-on-Tyne, where he will represent Daniel Adamson and Co.; Eckstein, Heap and Co.; Newton Bros. (Derby), and the St. Helens Cable and Rubber Co.

**Change of Address.**—The Electric Battery Co., of 180 High Holborn, are moving to 62 Eagle Street, High Holborn, W.C., where the manufacture of E.B.C. dynamos for car lighting, accumulators, &c., will be carried on.

**Foster Engineering Co., Ltd.**—Application was made on Tuesday, before Mr. Justice Swinfen Eady, to appoint a liquidator for the Foster Engineering Co., Ltd. It was urged, however, that the Company could meet its liabilities, and stay of execution for a fortnight was granted.

**Lancashire Dynamo and Motor Co.**—There was a net profit of £15,150 for 1912, and a final dividend, making 7½ per cent. for the year, is declared on the ordinary shares, after adding £6,000 to reserve. The Company is issuing the balance of the ordinary capital, amounting to £15,000.

**Large D.C. Generators.**—According to *Power* (New York), the largest D.C. generators ever built have just been installed by the Cleveland Electric Illuminating Co. There are two 275-volt, 3,750-kw. shunt machines driven at 180 r.p.m. through 10 to 1 reduction gears by steam turbines. The gear wheels have 259 and 26 teeth, and the larger is over 8 ft. in diameter.

**Institution of Mechanical Engineers.**—The provisional programme of the arrangements for the Summer Meeting, to be held from July 28th to August 1st at Cambridge, has just been issued. Besides the reading and discussion of Papers, to be announced later, a number of visits have been arranged to the laboratories, works, and other places of interest in Cambridge and Ipswich, as well as to the Queen's Engineering Works (W. H. Allen, Son and Co., Ltd.) at Bedford. Numerous social functions have also been arranged.

## SUMMARY

THE provisions of the draft street lighting specification which has been drawn up by a joint committee of electrical engineers, gas engineers, surveyors, and others were dealt with in a Paper by Mr. A. P. Trotter discussed on Tuesday at a meeting of the Illuminating Engineering Society. The proposals involve the stipulation of minimum illumination on a horizontal plane 3 ft. from the ground. The representatives of the gas industry argued that direct ray candle-power measurements were preferable. (Page 213.)

THE present position of electric supply in London was dealt with in a recent Paper before the Royal Society of Arts by Mr. Frank Bailey, who advocated

the development of the generating stations already in existence, as he believed that this would be cheaper than the establishment of large stations down the River Thames or in the coalfields. (Page 215.)

ELECTRIC lifts and a few other applications of electric power are exemplified at the Building Exhibition at Olympia, where a series of lectures on illumination has been arranged by the Holophane Co. (Page 215.)

GLASGOW policemen are being provided with electric hot plates in special signal boxes, and electric lanterns in place of "bull's-eyes." The signal boxes are arranged to enable the policemen on duty to telephone to the police office, and also to be summoned to speak to the office on the telephone by means of a system of signalling lamps. (Page 216.)

THE best and safest way to earth an extensive system of electrical distribution in a mine so as to obtain maximum safety is discussed in our "Questions and Answers" columns. (Page 217.)

A TUNGSTEN focus lamp and some stage lighting appliances are referred to on page 218.

AN ingenious train lighting dynamo is described and illustrated. (Page 219.)

A SOMEWHAT serious interruption to the L.C.C. tramway service occurred on Monday, owing to an accident at the Greenwich generating station. (Page 219.)

THE appeal in regard to the Telephone Arbitration is referred to under "Telephony and Telegraphy." The Telephone Co. objected to any appeal being made, but the Court held by a majority that it was allowable. The Telephone Co. are going to the House of Lords on this point. (Page 219.)

THE Specifications published by the Patent Office on Thursday last include one by E. O. Möller, of the British Westinghouse Co., for circuit connections to obtain the quick and certain operation of a circuit-breaker under all conditions. Others by T. W. Tattersall and C. F. Kettering deal with the application of iron wire resistances to variable-speed constant-pressure dynamos. A self-cleaning spark plug is described by J. J. Thompson, of America. The patent for a testing instrument for primers by G. C. Fraser and G. K. B. Elphinstone expires during the current week after a full life. (Page 220.)

SYSTEMS of charging based on rateable value are being adopted at Sheffield and Accrington.—A reduced scale of charges for the hiring of arc lamps is proposed at Hammersmith.—An experimental installation of electric street lighting is to be put down at St. Anne's-on-Sea. (Page 221.)

EXTENSIONS are to be made to the generating station at Swansea; and extensions to the generating plant at Newport (£10,600) are reported as necessary.—Local Government Board inquiries are to be held at Wolverhampton (£22,000); Carlisle (£7,500); and Dundalk (£5,000); and a loan of £1,565 has been sanctioned at Whitehaven. (Page 221.)

## ARRANGEMENTS FOR THE WEEK

FRIDAY, APRIL 18TH.

*Batti-Wallahs Society.*

8 p.m. Smoking Concert at Holborn Restaurant.

MONDAY, APRIL 21ST.

*Institution of Electrical Engineers: Newcastle Section.*

7 p.m. At Armstrong College. "Notes on Gas Engines," by A. P. Pyne.

*Institution of Post Office Electrical Engineers.*

5 p.m. At Institution of Electrical Engineers. Annual general meeting.

WEDNESDAY, APRIL 23RD.

*Institution of Electrical Engineers: Yorkshire Section.*

7 p.m. At the University, Sheffield.

*The 25 Club.*

7.15 p.m. Dinner at Connaught Rooms, Great Queen Street.

THURSDAY, APRIL 24TH

*Institution of Electrical Engineers.*

8 p.m. "On Phase Advancing," by Dr. G. Kapp.

FRIDAY, APRIL 25TH.

*Finsbury Technical College Old Students' Association.*

8 p.m. Smoking Concert at Waldorf Hotel.

## The London Electrical Engineers.

(To-Day) THURSDAY, APRIL 17TH. *C. Company.*—Recruit and Co. Training, 7 to 10 p.m.FRIDAY, APRIL 18TH. *D. Company.*—Co. Training, 7 to 10 p.m.SATURDAY, APRIL 19TH. *Headquarters* open from 10 a.m. till noonMONDAY, APRIL 21ST. *A. Company.*—Recruit Training, 7 to 8 p.m. Hopkinson Cup Competition, 7 to 10 p.m.TUESDAY, APRIL 22ND. *B. Company.*—Recruit Training, 7 to 8 p.m. Hopkinson Cup Competition, 7 to 10 p.m.THURSDAY, APRIL 24TH. *C. Company.*—Recruit Training, 7 to 8 p.m. Hopkinson Cup Competition, 7 to 10 p.m.FRIDAY, APRIL 25TH. *D. Company.*—Recruit Training, 7 to 8 p.m. Hopkinson Cup Competition, 7 to 10 p.m.SATURDAY, APRIL 26TH *Headquarters* open from 10 a.m. till noon.

**Linking up Supply Areas under the Act of 1908.**—Mr. Justice Joyce had before him on April 9th a motion by the Battersea Borough Council to restrain the County of London Electric Lighting Co. from laying mains in the Borough of Battersea to connect up their authorised areas of Southwark and Wandsworth. The Company supplies in Wandsworth, Lambeth, Camberwell, Southwark and Bermondsey, south of the Thames, all of which districts are connected, and in Clerkenwell, north of the Thames. There are generating stations in Clerkenwell and Wandsworth, which are connected by mains

over London Bridge through a sub-station in Southwark. The Company wished to lay further connecting mains between the generating station in Wandsworth and Southwark through Battersea. The Battersea Borough Council objected, and argued that under sec. 4 sub-sec. 2 of the Act of 1908, only one linking-up connection was provided for, and this the Company already had. The section reads as follows: "A Company may also by means of electric mains make a connection between any two or more areas which that Company is authorised to supply or between any such area and a generating station of that Company." The motion was, however, refused. There will probably be an appeal.

**Aberdeen Electrical Wiremen.**—The electrical wiremen in Aberdeen, having asked for a revision of their rates of pay, a conference between the masters and men has resulted in an agreement for the former to pay 8½d. per hour from May 1st, with an increase to 9d. per hour in three months. Foremen will be paid not less than ½d. per hour more than the ordinary rate from May 1st, with a probable increase to 9½d. in three months. Men engaged upon accumulators are to receive one shilling per day extra.

**Johnson Billington Electricity Meters, Ltd., Sued.**—On April 9th and 10th an action was before Mr. Justice Horridge and a common jury in the King's Bench Division by Mr. W. H. Johnson, the inventor and patentee of a meter, against Johnson Billington Electricity Meters, Ltd., to recover about £143 as balance of salary. It appears that Mr. Johnson had an agreement with the company as manager for a period of five years, by which the company could get rid of Mr. Johnson, while on the other hand he was bound to give his whole time and attention to the business of the company. The Meter Company contracted with the Beck Flame Lamp Company to make the meters, but these were never made, and considerable sums of money paid to the Beck Company by the Meter Company were used for other purposes. Some of the directors of the Meter Company were directors of the Beck Company, but it was alleged, among other things, that Mr. Johnson had been negligent in not informing the directors of the Meter Company that the Beck Company was insolvent, though he did not have access to their books. It was also alleged that he had been devoting a large amount of his time to the Beck Company, though it appears he was never paid anything for this and that he did it in his spare time to help that Company to fulfil its lamp contracts with the Sydney and Dublin Corporations. The jury found for Mr. Johnson for the full amount claimed.

## STREET LIGHTING SPECIFICATIONS

A Paper entitled "Standard Clauses for Inclusion in a Specification of Street Lighting," by Mr. A. P. Trotter, formed the basis of a discussion on Tuesday evening at a meeting of the Illuminating Engineering Society. The author referred to the formation of the Joint Committee of four bodies interested in the subject, and outlined the work they had done on the subject. This Committee was constituted as follows:—

*Institution of Electrical Engineers.*—Messrs. W. H. Patchell, Frank Baily, K. Edgecumbe, S. Z. de Ferranti, Haydn T. Harrison, S. L. Pearce, H. Faraday Proctor, A. P. Trotter, and Prof. J. T. Morris.

*Institution of Gas Engineers.*—Messrs. W. Doig Gibb, S. Y. Shoubridge, and R. Watson.

*Institution of Municipal and County Engineers.*—Messrs. E. J. Elford, G. F. Carter, T. W. A. Hayward, E. B. B. Newton, and N. Scorgie.

*Illuminating Engineering Society.*—Prof. S. P. Thompson, Messrs. L. Gaster, F. W. Goodenough, J. W. Ife, and A. H. Seabrook.

Mr. Gibb and Mr. Seabrook afterwards resigned, and Mr. J. W. Bradley was co-opted as an independent member.

This Committee agreed provisionally:—(1) The specification to be based on illumination, the unit to be the foot-candle. (2) The standard of comparison to be the minimum horizontal illumination at a height of 3 ft. 3 in. above the ground level. (3) The maximum horizontal illumination at a height of 3 ft. 3 in. above the ground level shall not be more than — times the minimum. (4) When the horizontal illumination cannot be conveniently measured, or is below the useful range of the instrument available, it may be calculated from observed data.

There was some opposition to the first of these points, and Mr. Trotter devoted a considerable portion of his Paper to the *pros* and *cons* of the illumination rather than the candle-power basis. One of the chief objections from the contractor's point of view to a specified illumination was that it gave a little more trouble in working out the scheme, and this led to the question of how the work of design was to be apportioned between the lighting authority and contractor. Mr. Trotter remarked that: "It seems better that the lighting authorities should settle what it is they want to buy, and, having specified it, to leave details to the competitive skill and wider experience of contractors. What, then, are these authorities 'out to buy'? Not lamps, not candle-power, but illumination."

Another objection to the illumination basis arose from the impression that it was easier to measure candle power than illumination. There were difficulties in direct measurement of very low illuminations and therefore candle-power measurements are proposed in the draft specification where the illumination is under 0.01 candle-foot. In the extreme case of country roads, where the lamps serve really as beacons, candle power must obviously be the basis. For the more brilliant lighting there was no difficulty in measuring the illumination direct; there were several instruments suitable for the purpose, and a more truthful result was obtained as to the resultant effect of several lamps near together; also, less calculation was necessary than with candle-power measurements, and especially where, as is recommended, minimum illumination is to be measured, the labour is much reduced.

With regard to the vexed question of horizontal, vertical or direct-ray measurements, Mr. Trotter sums up the main advantages of the horizontal plane as follows:—

"(1) If the illumination on it is sufficient, that on the other planes must be better; and (2) the illuminations received from all neighbouring lights add themselves together and give one single quantity which may be measured by one single observation. The economy of time and saving of calculation is enormous."

The question of specifying average, maximum or minimum illumination is then discussed. Not only was the average illumination difficult to ascertain with accuracy, but a little consideration shows, writes the author, that, while the mean illumination of a street may be up to a reasonable standard, it may have alternations of dazzling brilliance and dismal darkness. This proposal might, therefore, be discarded.

The most satisfactory test, he continued, appears to be the simple minimum illumination. Any excess of light may be regarded as a voluntary benefaction from the lighting authority or an unavoidable concession by the contractor.

The Paper then deals with the classification of streets. The surveyor members of the Committee drew up a scheme,

dividing them into special thoroughfares, first-rate main lines of thoroughfare, auxiliary roads and relief main roads, and side and unimportant streets. This purely qualitative classification was checked by quantitative measurements made by Mr. K. Edgecumbe, Prof. J. T. Morris and Mr. Trotter, who made a long series of photometric observations, of which most interesting details are given in the Paper. The agreement with the surveyors' classification was wonderfully close, and it was finally recommended to classify all ordinary thoroughfares (that is, excluding those where specially brilliant illumination is required) as follows: Minimum illumination at least (a) 0.01 ft. candle, (b) 0.025 ft. candle, (c) 0.04 ft. candle, (d) 0.06 ft. candle and (e) 0.1 ft. candle. In connection with the first class, a table calculated by Mr. Haydn T. Harrison is given to show the candle power required to produce a minimum illumination of 0.01 ft. candle on a horizontal plane 3 ft. from the ground midway between two lamps of a given distance apart.

The Committee then proceeded to discuss various alternative forms of draft standard clauses and other matters, and finally the draft clauses given below were put forward. These were accepted by the Council of the Institution of Electrical Engineers, and with slight modifications in drafting by the Institution of Municipal and County Engineers. The Illuminating Engineering Society accepted them as a tentative specification and suggested the addition of a supplementary specification defining the conditions to be complied with by street photometers. The Institution of Gas Engineers, however, still refuse to agree to the fundamental principle of stipulation of minimum illumination on a horizontal plane.

### DRAFT STANDARD CLAUSES.

(1) *Intent of Tender.*—The form of tender headed "Lighting of" includes the provision, fixing, connection and maintenance of all lamps necessary for obtaining the illumination specified as Class . . . in and according to the conditions of the standard specification.

(2) *Unit of Measurement.*—This specification is based on illumination, the unit of measurement being one foot-candle.

(3) *Classification of Streets.*—For convenient reference the streets are classified as having a minimum illumination as follows:—

Class A	...	...	...	0.01	foot-candle
" B	...	...	...	0.025	"
" C	...	...	...	0.04	"
" D	...	...	...	0.06	"
" E	...	...	...	0.10	"

Street lighting at a lower minimum illumination than 0.01 candle-power may be specified by the height and distance apart of the lighting units, and the candle-power as measured in the direction of the thoroughfare, at an angle of ten degrees below the horizontal.

(4) *Minimum Illumination.*—The "minimum illumination" of a street means the minimum illumination on a horizontal plane at a height of 3 ft. 3 in. above the ground level, and may be measured by means of:—(a) Any suitable illumination photometer, or (b) Any suitable photometer adapted for use in the street which will measure the candle-power of the lamps in those directions which meet at the point of minimum illuminations. In this case the minimum illumination will be calculated by adding together the values of the illumination received from each lamp that materially contributes to the result.

(5) *Special Illumination.*—The special illumination of certain points indicated on the map, such as the corners of cross streets, may be dealt with by specifying the positions and height of lamps and illumination at those points.

(6) *Type of Photometer.*—The photometer shall be of the . . . type, or of such other type as may be agreed between the parties.

(7) *Position of Lighting Units.*—The approximate positions of the lighting units are indicated on the accompanying map, and are correct within the limits of deviation marked thereon. The contractor shall indicate the positions of all the lighting units, either by completing the said map or by a descriptive schedule accompanying his tender.

(8) *Particulars of Lighting Units.*—Detailed particulars of each type of lighting unit included in the tender must be inserted in the space provided for that purpose in the specification, and must include a statement of the height at which it is proposed to place the centre of light of each type of unit above the street surface, subject to a declared minimum.

(9) *Drawings.*—Drawings of all details as required by the specification shall accompany the tender.

(10) *Samples.*—Samples shall be submitted if required before the acceptance of the tender.

(11) *Number of Lighting Units.*—The number of each type of lighting unit required must be inserted in the tender, with,

## SMALL INDUCTION MOTORS FOR ALL CLASSES OF WORKSHOP DRIVING.

PROMPT DELIVERY IN SIZES FROM  
1/2 TO 10 H.P. AT ALL THE USUAL  
SPEEDS AND PRESSURES.

OPEN, PROTECTED & ENCLOSED TYPES.

HIGHEST GRADE MATERIAL and  
WORKMANSHIP.

**BROWN, BOVERI & CO., Limited**

CAXTON HOUSE, WESTMINSTER, LONDON, S.W.

And at MANCHESTER, GLASGOW,  
and NEWCASTLE.

if called for, a quotation for the provision, fixing, and connection of the necessary apparatus, and the price per annum for maintenance and for . . . hours' lighting, on which the tender is based.

(12) *Additional Lighting Units.*—The contract will provide for additional lighting units if required, such increase not to exceed . . . per cent., and to be paid for at the quoted rate per lighting unit.

(13) *Tests.*—A test of the illumination shall be made under such normal atmospheric conditions as will not appreciably affect the accuracy of the result, and at a fairly selected point not being in the shadow of a mantle, lamp, electrode, lantern bar, post, tree, or other obstruction. When a minimum illumination or candle-power of lighting unit is specified, it shall be held that such minimum is obtained if the average of the measurements of any three minima between consecutive lighting units of the same type does not fall below it.

(14) *Contract to be Signed.*—The tender contains the usual clause that the provisions, conditions, and prices named therein shall form the basis of a contract containing the necessary legal provisions to ensure its fulfilment.

(15) *Heads of Clauses for Contract.*—The contract will also include provisions for:—Ensuring the lighting of all lamps during fog at prices to be quoted. Execution of work in such manner as may be necessary for the convenience and safety of the public. Indemnifying the Council against claims arising out of the execution or maintenance of the work or failure of the lighting. Payment of moneys due for work done. Defining the responsibilities of the contractor, and to enforce the conditions of the specification and tender with due regard to practical difficulties.

Mr. Trotter commenced the meeting with a few remarks, emphasising some of the most important points in his Paper, after which a vote of thanks to the author was proposed by Mr. W. H. Patchell, and seconded by Mr. F. W. Goodenough from the chair.

This discussion was opened by Mr. HAYDN T. HARRISON, who said that the main object was for lighting authorities to settle what it was they wanted to buy, and to reduce its definition to a definite basis. He did not himself object to illumination as illumination being the basis, but objected to minimum horizontal illumination because of the difficulty of its direct measurement when of low value, but as regards the lowest class of street, the objection had been met in the proposed specification by allowing a candle-power measurement at such an angle as would reach the point of minimum illumination. Actually

the amount of illumination of a street often depended really on the expenditure that could be afforded from the rates to pay for it, and the specification facilitated the best results being obtained for the money. The main thing that drivers of motor-vehicles objected to was transition from dark to bright spaces, and the minimum specification helped to get over this difficulty. The matter had been dealt with in some other countries on similar lines. The metre was a very suitable height for making the measurements, and was roughly half-way between the ground level and the pedestrians' faces. If the illumination was satisfactory at that height, it would be even better on the ground. He declared himself perfectly satisfied with the specification, although he had himself been in the habit of making candle-power tests, especially with street lamps of moderate size.

Mr. R. WATSON (Gas Manager, Doncaster), in representing the views of the Institution of Gas Engineers, said that they did not consider that minimum horizontal illumination afforded a true guide in comparing effects of lamps with very different polar distribution curves. He defended specifications of normal or direct-ray candle-power at the point of minimum candle-power, and contended that in enabling us to see objects and avoid collisions, it was the direct-ray illumination. The measurements could be made more accurate where there was diffused and stray light, and he pointed out that the author admitted that with the lowest class of streets, which amounted to 80 per cent. of the whole, illumination could not be used as a basis at all. "Horizontal illumination tests exaggerated the diversity factor."

Mr. J. J. CLARKE (Testing Department, Gas Light and Coke Co.) also defended the candle-power basis as being capable of much more exact definitions. He held that the minimum position was difficult to find, and that a definite position ought to be specified. He was of opinion that the height of the test flame from the ground should have some relation to the height of the lamp if it was to be equally fair to all classes of lighting.

Mr. FRANKLIN T. THORPE, speaking as a gas engineer, also considered the direct-ray test fairer to all classes of lamps, and wished that the character of the spectrum of the light could be taken into account in some way. He thought that Mr. Haydn Harrison's table showing the candle-powers necessary to produce the desired illumination for various heights and distances of lamps was in itself a powerful argument against the minimum horizontal illumination basis, and took examples to show how what he considered an equal effect as measured on the direct-ray basis could be obtained with smaller lamps.

Mr. K. EDGECUMBE (Everett, Edgcombe & Co.) declared himself a "whole-hogger" in favour of minimum horizontal illumination, and said that the close agreement between the surveyors and photometric reports was striking testimony of the minimum horizontal illumination basis; it gave the same result as the physiological effect, and was thus an excellent measure of what was required. Direct measurement of illumination was not insisted upon by the specification, although both Mr. Trotter and he thought that it was much easier than deduction from candle-power observations. He contrasted the complexity of the Westminster specification with that before them.

Mr. J. DARCH regretted that the harmful effects of glare, which often vitiated the effect of illumination, had not been taken into account in the specification, and looked forward to a Utopia where streets would be lighted by indirect illumination reflected from the house fronts.

The discussion was adjourned till April 29th.

**Institution of Electrical Engineers.**—The following is the result of the ballot for new members and transfers from one class to another at the meeting on Thursday:—*Members:* J. F. Martins-Guimarães, S. W. Newington, J. Wayne-Morgan, R. O. Wright. *Associate Members:* P. B. Addison, A. J. Bousfield, J. Braby, H. Bridges, J. R. Brookman, S. Delany, W. H. Duncan, C. D. Falcke, U. A. Farrell, J. Firth, H. V. Hart-Davis, T. H. M. Harvey, E. W. Jackson, T. J. Kendrew, T. E. Lewis, D. McKinlay, S. C. Midwinter, P. W. Milne, G. D. Rogers, H. W. Schilbach, D. S. Strang, R. G. Tolley, A. C. Wampach, W. Weekes, J. White, W. E. Wilde, E. Williams, C. R. M. Young. *Graduates:* H. M. Bamford, T. H. Barr, F. S. Beamish, E. A. Belcher, G. L. Birch, F. Farrar, W. L. Gray, F. G. Heymerdingner, W. G. Kimber, F. E. Lewis, J. H. McClay, T. C. Roberts, R. C. Roy, H. Tabossi, H. C. Turner, G. Verghese, E. Wolf. *Students:* A. G. Akehurst, G. M. Burnand, T. R. Evans, W. E. Gardner, R. E. James, L. B. Maulson, J. D. Ross, P. J. Ryle, C. A. Sutcliffe, A. E. W. Wemyss. *Candidates Transferred:*—*Associate Member to Member:* E. Barrs, J. R. Blaikie, H. L. Dixon, E. Harlow, L. Johnston, G. A. Pearson, P. M. Robinson. *Associate to Member:* J. D. L. Bradwell, F. C. E. Burnett, J. N. A. Houblon. *Associate to Associate Member:* J. Y. Fletcher, J. Murray, J. Scott, T. F. Tate. *Graduate to Associate Member:* W. J. I. Casewell. *Student to Associate Member:* H. Bedson, E. Crawshaw, W. Eccles, P. Furness, S. Johnson, A. Monkhouse, P. Smith, A. M. Willmore. *Student to Graduate:* G. E. Bairsto, A. M. Faulkner, A. V. Ferguson, W. E. Hatfield, H. C. Healey, D. W. McIntyre, A. A. Maytham, A. W. Miller.

## ELECTRIC SUPPLY IN LONDON

MR. FRANK BAILEY read a Paper with this title before the Royal Society of Arts on April 9th, in which, after detailing the progress that has been made since his original Paper on the same subject in 1890, he gives the following figures for the fourteen local authorities who work their own Provisional Orders, for the years ending March 31st, 1912 and 1913:—Capital expended, £6,602,055; units sold, 94,445,100 and 114,708,000; Maximum load (winter, 1912-13), 59,130 units. For the thirteen London companies, in this case up to Dec. 31st., the capital expended is £14,613,196; the units sold, 163,203,264 and 177,323,258; and the maximum load, 103,980 units. The capital expended in both water and gas undertakings is approximately double that expended in electricity supply undertakings. This output includes some supplies given for railway and tramway purposes within the County of London. The total amount of electrical energy used for all purposes may be estimated for the year 1912 as follows:—Railways, 271,600,000 units; tramways, 130,000,000 units; and general supply, 277,500,000 units, making a total of 679,000,000 units. In the year 1906 the electric supply authorities combined to make an exhaustive canvass of all factory power users in London, and ascertained that the total power required in all districts within the County of London was 156,000 kw. The total connection for electric power now amounts to about 135,000 kw., or 86 per cent. of the power required. The average cost per kw. is about £2 15s. 8d. per annum, or £2 1s. 6d. per h.p. per annum. Since 1884, when Sir Charles Parsons constructed his first turbine—in 1888 a turbo-generator giving 75 kw. with a steam consumption of 58 lb. per kw.-hour was considered an achievement—to the present time progress has been rapid, until now Dr. Ferranti anticipates a consumption of 8.5 lb. per kw.-hour with highly superheated steam, and oil-immersed toothed gearing between turbine and generator is being used on a number of plants under construction.

The author then said that it had been suggested that large electric generating stations in the coalfields or down the river would, by superseding all the existing stations, secure some economy in the costs of generation. Such economies could easily be shown on paper, and it could with equal ease be demonstrated that the additional cost of mains and losses in transmission more than counterbalanced any hypothetical economy in generation. London is at present supplied from thirty-eight generating stations. Many of these were equipped with plant of the latest design and had facilities for extension at low capital cost. It would appear to be wiser to convey coal to them rather than to provide expensive copper mains from distant works. Some of the existing works had sites of the utmost value to the future supply of London, and, so long as the centre of gravity of the whole demand fell at a hypothetical point not far from the south side of Blackfriars Bridge, it was clear there was greater economy in developing works on all sides of this point rather than the concentration of the load in a distant region. All the existing works had still some useful life in them, and by a comparatively small expenditure they could be maintained in a high state of efficiency; but many of them were limited in their ultimate resources, and when these were exhausted it might be better to concentrate development on more advantageous sites. Owing to the chance of purchase of the London companies by the L.C.C. in 1931, further works of development would require strict economy, coupled with immediate return of some profit to avoid a loss of capital to those who had encouraged and practically founded a new industry. The system of mains, including design, material and workmanship, adopted throughout London was one of the most perfect examples to be found in any city, although it was not cheapest. Lead-covered cables, insulated with oil-impregnated paper were generally employed, and these actually improved with age so long as the lead sheathing was undamaged.

After reminding his audience of the manifold uses of electricity for domestic purposes, Mr. Bailey urged the more general use of ozonisers—limiting the ozone to one part to a million parts of air, as then there is no unpleasant odour or respiratory irritation—for halls, buildings and houses. At present the health of the workers in our factories received more attention than that of our national representatives and judges. No large city in other countries entrusted its electrical supply to municipal enterprise, and the final question of municipal trading v. controlled monopoly had been settled, with advantage to the municipalities, by allowing them some return on the profits, by limitation of dividends on a sliding scale, and by conditions of tenure. As regards rates of charge,

the average in London for 1910 was 3.42d. for lighting and 1.16d. for power, including meter rents, while in Chicago in 1912 the average prices were about 3d. and 2d., and in Berlin about 4.7d. and 1.88d. plus charges for fixing and hire of meter, cost of house connection, and 4 per cent. on the cost of the installation for the cost of the compulsory inspection of wiring. In Paris the authorised rates of charge are 4.8d. for lighting and 2.9d. for power.

The Discussion was opened by the Chairman (Mr. A. A. Campbell Swinton), who thought that people would cease to find money for investment in a concern liable to be bought up at a very low price in a few years, and in his opinion the last Electric Lighting Act had not adequately provided for this. Mr. J. H. Rosenthal (Babcock and Willcox) was not so pessimistic as Mr. Bailey on the subject of the acquisition of the present stations by the L.C.C. He thought that county councils and municipalities would find it no less difficult to raise money than the companies did, so that very likely the L.C.C. would not take advantage of their purchasing powers. Mr. W. C. P. Tapper (Borough Electrical Engineer, Stepney) did not agree with the view that the whole of the 38 stations should be further developed. A good many, having water facilities, might be so developed, but the six or seven of the better placed stations should be chosen for further development. The steam plant of existing stations could be run at peak load time until such time as it paid to scrap it. Such an arrangement would serve for many years to come, and could easily be handled by a central authority. Mr. A. H. Law (C. A. Parsons and Co.) was in favour of one central generating station carrying the load of 163,000 kw. required for the whole of London. Mr. W. M. Mordey, Mr. Leon Gaster, and Mr. G. W. Mascord also spoke, and the Author replied briefly.

## ELECTRICITY AT THE BUILDING EXHIBITION

ALTHOUGH it could hardly be expected that the Building Trades Exhibition, now being held at Olympia, would contain a very large proportion of exhibits of directly electrical nature, there are several firms connected with electrical engineering who have interesting exhibits, even if no very striking novelty is presented. Electric lighting is of course conspicuous on all the stands, and, especially in the beautiful temples dedicated to the decorators' art and the palaces of the paintmakers, there are some fine examples of up-to-date systems of electrical illumination. Some of the semi-indirect fittings are very handsome, and there are quite a number of examples of the "Indra" system (see ELECTRICAL ENGINEERING, Jan. 30th, p. 64), which was recently introduced by the Electrical Engineering and Equipment Co. (102 New Oxford Street, W.). Electric power is also made extensive use of on the stands, and motors are seen driving such apparatus as concrete mixers, brickmaking, woodworking and paint-grinding machinery.

Perhaps the best represented branch of electrical engineering is that of electric lifts. It almost goes without saying that R. Waygood and Co., Ltd. (Falmouth Road, S.E.), have a good display. On their stand they have erected a full-sized electric lift with car switch control, exemplifying some fine designs of metalwork, and with a beautiful car of light metalwork with glass panels. This is provided with an improved design of combined electrical and mechanical gate lock with several features to recommend it. A model of a push-button lift is also shown. A novelty, which the firm are showing is a system of control of vacuum-cleaner pumps, applicable to electric or hydraulic apparatus, in which a switch or valve is mounted on the actual tool or nozzle handle, so that the motor, even when permanently installed in the basement, need only be kept running when cleaning work is actually being done. Another conspicuous lift exhibit is that of Marryat and Place (28 Hatton Garden, E.C.), who have erected a sort of Eiffel Tower in the body of the hall, which contains an example of their push-button automatic electric passenger-lifts. Among the leading features of this are the arrangements for accurate floor levelling, a two-speed attachment and the gravity self-closing interlocked gates. Some notes on the Marryat and Place automatic lift, which will be remembered at the Electrical Exhibition of 1911, were given in ELECTRICAL ENGINEERING (Oct. 12th, Exhibition Supplement, p. 75). Another lift with several good points that has been described in our columns (see ELECTRICAL ENGINEERING, June 6th, 1912, p. 303) is the Graham lift, of which a beautiful working model is to be seen on the stand of Scholey and Co. (151 Queen Victoria Street, E.C.). A working electric lift is also shown by Medways Safety Lift Co. This, which is distinguished by the particularly fool-proof nature of the reversing gear, is generally similar to lifts previously exhibited by the same firm. Other applications of electric power represented are vacuum cleaning and ventilation. The

former is exemplified by a complete range of electrically-driven vacuum cleaners of all sizes shown by the British Vacuum Cleaner Co., and the latter by the well-arranged display of their well-known specialities by Ozonair, Ltd.

Electric lighting *per se* is not well represented. Here and there we find amongst other machinery an oil-engine driven generating set suitable for a country house, but nowhere a complete equipment. The best show of fittings is that of Osler and Co., but the most energetic exhibitors connected with lighting are the Holophane Co. Not only do they display all their latest designs of reflectors on their stand in the gallery, but through their enterprise lectures are being given at 8.30 every evening on "Illumination Based on Scientific Laws." The well-known "Tubolite" system of lighting is shown by the Linolite Co., who, amongst other things, also demonstrate the Woodhouse metal conduit wiring system.

Electric heating has a solitary exponent in the Carron Co., who not only show some artistic designs of radiators, but also have a complete electric cooking range on view. This is of substantial construction and comprises an enamel-lined oven with glowing heating elements top and bottom, a glass inner door, a well-lagged outer door and a thermometer; a grill, a hot-cupboard and several hot-plates on the top. The oven elements are open wire coils on fire-clay bases, but the heating wires of the hot-plates are of course concealed. Every element has three degrees of heat, and they are controlled by rows of switches on either side of the apparatus, all fitted with indicators to show which degree of heat is on, and with separate cartridge-type fuses.

Among other miscellaneous exhibits it will not be out of place to mention the stand of the India Rubber, Gutta Percha and Telegraph Works Co., Ltd. (Silvertown), who show their patent india-rubber flooring, as well as samples of cables and other of their manufactures. We should also refer to the fine display of varnishes of all kinds by Pinchin, Johnson and Co., Ltd. (26 Bevis Marks, E.C.), who are so well known for their insulating varnishes and compounds. Ladders, scaffolds, &c., in many useful varieties are shown by Heathman and Co. (10 Parsons Green, S.W.), and electric-light casing and other woodwork, joinery, &c., are to be seen in profusion on the stand of C. Jennings and Co. (Pennywell Road, Bristol).

## ELECTRIC SIGNAL BOXES, HOT PLATES, AND LANTERNS FOR THE GLASGOW POLICE

GLASGOW is probably the first city to provide electric heaters for warming food and tea for policemen on night duty. A number of signalling boxes of the latest pattern are being completed for the service of the police at various points in the city, and in addition to the interesting telephone and signalling equipment which is their *raison d'être*, these hot-plates are being provided.

The boxes are roomy structures, 8 ft. high, 3 ft. 4 in. long and 2 ft. 4 in. wide, made in cast-iron sections, bolted together and set on concrete bases placed 6 in. below the ground level, the floor being a couple of inches above to keep out surface-water. A small cast-iron lamp column 3 ft. high, surmounted by a wrought-iron pipe 2 ft. above it, is fixed on the top of the box to take the telephone insulators and in some cases the signal lamp.

Owing to traffic considerations it was not possible to choose the ideal site, viz., in the centre of street crossings, for these boxes, and consequently most of them were put in side streets, and sometimes in out-of-way corners, but all as near as conveniently possible to where two, three or more policemen's beats meet. When a box was hidden in this way the signalling lamp was not placed on the box, but on suitably situated trolley or lamp-posts, or on the corners of buildings, and in some cases two signal lamps were erected to ensure visibility from all the required directions.

Each box is fitted up with a standard post-office telephone, supplied with direct line to the nearest police office. A number of boxes connect two, and sometimes three, police offices. The operation of ringing up a box is effected in the usual way from the police office, and a branch circuit from the telephone in the box is coupled up to a specially constructed relay which switches on the signal lamp; at the same time, the closing of the lamp and relay circuit sends back current to the police office, which rings a bell there to indicate that the signal is given at the box. The official who has rung up the box then withdraws the telephone plug and inserts it into a specially constructed call-bell, which rings

immediately the policeman lifts the receiver off the switch-book.

The policeman, when answering a call, plugs into a jack, which, besides putting the telephone into circuit, disconnects the signal lamp, and the relay resets itself ready for the next call. By plugging through, it is also possible to put the signal boxes in telephonic communication with the post-office telephone system. No meters are fitted; the energy used for the lamp and heater is charged at a fixed rate per annum. A specially designed cut-off switch is operated by the door-sneek, connected so that the electric heater can only be in circuit when the box is occupied and the door is closed by the sneek. In this way the hot-plate cannot be left in circuit even if the policeman omits to turn off the switch when he leaves the box. The hot-plates at present employed are Ferranti's 850-watt make, of the standard design shown in the illustration; these have replaceable heating elements in accordance with Messrs. Ferranti's standard practice.

The total number of police signalling boxes that will be employed in the city area is sixty-nine, including some boxes of older patterns.

Another luxury for the Glasgow policemen is an electric lantern of moderate weight to replace the hot and uncomfortable bulls-eye lantern. It weighs 1 lb. 13 oz. complete with accumulator, and gives light from a 0.6 amp. bulb lamp for about six hours continuous burning. A good bi-convex lens is used, and the circle illuminated is even throughout.

The weight of the lantern is distributed in the best possible manner, and, being carried close to the body, is not appreciable to the same extent as the old type of lamp. In the manufacture of the case projections are reduced to a minimum, the lens, handles and switch being practically flush with the case. The latter is recessed, the object being to guard against accidental switching-on of the lamp when being replaced on the belt. It is so situated that the lamp may be held and the switch operated by the use of one hand only.

The door is hinged at the bottom and is locked to the case proper by two projecting tongues fixed to the back of the lens bezel to prevent unauthorised persons tampering with the interior.

By means of a special key (kept by the lamp-room attendant) these tongues are made to turn in a circle and to lock on to a strip of metal inside the case.

The reflector, which is of spun soft iron and coated with hard, white, washable enamel, is mounted on the metal strip which acts as a hasp to the locking-tongues.

The features of the accumulator are a non-spilling vent plug and non-corrosive terminal connections, which enable repairs to be effected with a minimum of labour. The vent plug is made of two parts, and has a hollow recess filled with cotton-wool. This gives freedom to the exit of any gas generated, and effectually checks the acid from spraying.

We have to thank Mr. W. W. Lackie, the Glasgow City Electrical Engineer, for kindly responding to our request for the information contained in this article.

**The Forthcoming Electrical Exhibition at Glasgow.**—Some further particulars are now available of the Electrical Exhibition which is to be held by the Corporation of Glasgow from October 23rd to November 15th at the Zoo Buildings, New City Road, and applications for space may now be made to Mr. J. A. Freer, General Manager, 38 Bath Street, Glasgow. Arrangements are being made to supply exhibitors, to a reasonable extent, with electricity for power and lighting free. There will be a special cinematograph display demonstrating the latest applications of electricity, and manufacturers are invited to send particulars of any suitable films which they may have. The Corporation will erect the stands and the cost will be included in the charge for space. The exhibits will exemplify electric heating, cooking, and laundry work, generating plant transmission and utilisation of electric power, lifts, fans, smoke-prevention, and shop-window lighting, and the arrangements include lectures and demonstrations.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelopes.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,335.

It is proposed to make a purchase of six booster rotary converters and transformers operating from A.C. to D.C. Describe the necessary tests, stating points which should be watched.—"MET."

(Replies must be received not later than first post, April 24th.)

### ANSWERS TO No. 1,333.

In connection with a group of collieries there is a power plant generating about 4,000 kw., voltage 2,500, periodicity 40. At the different pits there are transformers, 2,500 to 500 volts, for supplying current to several motors, also some of the motors are driven direct from the 2,500-volt circuit. At one pit about half a mile from the power station there are several 150-kw. 2,500 to 500 volt transformers. At the generator end the neutral point is not earthed; the electrical rules in mines require all transformers fitted with some arrangement to prevent the low-tension side being charged with H.T. through any leakage, &c. This can be done, of course, by earthing the neutral point of the low-tension side of the transformer. Will it be a suitable and safe arrangement in the circumstances to earth the neutral points on the low-tension side of all the transformers and to connect all the neutrals to two common earth-plates? Supposing also that the neutral points of the generators are connected to earth, are there any objections to connecting the low-tension neutrals from the transformers to the same two earth-plates as the generator neutrals would be connected to? In addition to earthing all neutral points, is it also advisable to connect up all ironwork in connection with plant to the common neutral earth-wires?—ELECTRIC.

The first award (10s.) is made to "ALPH" for this reply:—

If the transformers are not connected in parallel on the low-tension side, the secondary of each transformer with its load forms a separate system, and the neutral points of all the transformers should be earthed. It will be quite satisfactory to do this by connecting the neutrals of all the transformers together and to two common earth plates as suggested. If two or more of the transformers are permanently connected together on the L.T. side and operated as one unit, it will be sufficient to earth the L.T. neutral of only one of these, since the whole will form one 500-volt system, and the Home Office Rules definitely state (Rule 7, c. i.) that "the neutral point of a polyphase system may be earthed at one point only." If two or more transformers are connected so that they may be run either in parallel or separately on the secondary side, the L.T. neutral of each transformer should be connected to the earthing system through an isolating switch, so that while any transformer may be run separately with earthed neutral, one only may be earthed if all are run in parallel. This is contrary to the strict letter of the rules, which forbid the insertion of a switch in the earth conductor, but under the circumstances it will usually be passed as satisfactory. Approval should, however, be obtained from H.M. Inspector of Mines before such an arrangement is installed, as it is possible that, owing to local conditions, it would be preferable to leave the neutrals of all the transformers permanently earthed, whether running

in parallel or not. With modern transformers it is very unlikely that any serious circulating currents would flow between the neutral points under these conditions. Of course, if the transformers are not running in parallel on the L.T. side, there is no possibility of circulating neutral currents.

There is no objection to connecting the generator neutrals to the same earthing system as the L.T. transformer neutrals; in fact, this would be advisable, particularly if the transformer cases were connected, by means of the cable sheathing or otherwise, to the generator earthing system. The following points should, however, be noted: (1) The transformer H.T. neutrals must not be earthed if the generator neutral is earthed. Not only would there be a danger of heavy circulating currents, but also Rule 7, c. i., cited above, would be infringed. (2) Owing to the likelihood of circulating currents (particularly if the generators are not of similar design) and to Rule 7, c. i., the neutral of only one generator should be earthed if two or more are running in parallel. As in the similar case of transformers mentioned above, it will be necessary to obtain approval of the use of isolating switches in the neutral connections to permit of any one machine being earthed when running alone. (3) In the case of a sub-station half a mile distant from the power station, it would certainly be advisable to have a reliable "earth" at both places, even if a common earthing system is used for the two. (4) In order to limit the current rush on a heavy fault, which would otherwise form practically a short-circuit on the phase on which it occurred, it is usual to insert a resistance in the earth connection of a generator or transformer, this resistance being designed to pass sufficient current to operate the overload release of the heaviest feeder with certainty on a fault. All the interconnections of the common earthing system must be on the earth side of these resistances, otherwise there is a danger of a heavy fault causing a dangerous rise of potential on the earth connections, since, under certain conditions, practically the full-phase voltage may exist across the earthing resistance until the automatic switch clears the fault. In reply to the last query, it is advisable to connect the neutral points to the same earthing system as is used for the ironwork, &c., in connection with the plant; in fact, in the official memorandum attached to the Home Office code of rules, it is stated that "the connection (of the neutral) should be made to the earthing system . . . to which the metallic sheathing (if any) of the cables is connected . . . and not to a separate earth plate." The frames of the machines, &c., will, of course, be bonded to the cable sheathing.

The second award (5s.) goes to "POLYPHASE" for the following:—

There is no doubt that in the particular installation cited by "Electric," to conform to the rules for Electricity in Mines in connection with the prevention of an accumulation of high potential on the low-voltage windings of transformers, &c., the very best thing to do is to earth the L.T. neutrals of all the transformers to one or more earth plates depending on the location of the plant; the number of earth plates makes no difference at all, provided a good earth is obtained. This is so because there is always a possibility of the L.T. windings being raised to a high potential by a breakdown between H.T. and L.T., or by a ground on the H.T. line. (In some recent tests as much as normal H.T. volts on L.T. winding.) Thus, earthing the L.T. neutrals will therefore be a safe and practical arrangement, which is cheaper and in many respects better than the use of earth shields between H.T. and L.T. winding or other static earthing devices connected on the L.T. winding. If the motors, &c., operated off the L.T. windings of the transformers are some distance from the transformers, it would seem advisable to earth the neutrals through a resistance so as to limit the current rush in the event of a fault between motor and transformer. There is no objection in connecting the generator neutrals to the same earth plates as the L.T. neutrals of the transformers are connected. No triple frequency current can flow because there is no continuous electrical connection between generator and transformer.

If the 2,500-volt supply is transmitted to the different pits by overhead wire, there seems to be no reason for earthing

the generator neutrals, since they (the generators) must be designed to withstand the strains due to static disturbances on the overhead line, and the only advantage gained by grounding is the limitation of voltage above earth to 58 per cent. of line volts. Should, however, the supply be by underground cables, it might be advisable to earth the neutral to limit the static capacity to ground, and the fault current by earthing through a resistance. If it is decided to earth the generator neutrals they should preferably be earthed separately through a resistance to the common earth plates, so as to limit any circulating currents between generators due to differences in design of generators and prime movers. It should be noted that when the generator neutrals are earthed the 2,500-volt motors, if star connected, must not have their neutrals earthed, otherwise it is likely trouble may be experienced, due to triple-frequency currents between motor and generator.

It is always advisable and safer to connect up to the common "earth" all metalwork in connection with the plant, as it is quite possible under certain circumstances to detect appreciable electrostatic charges on adjacent metalwork.

With reference to "ALPH's" remarks on the bearing of rules 7 (c, i) and 8 (c), as to switches in earth conductors, it may be pointed out that in reality the difficulty does not exist. Though an earth conductor may not have a "switch, fuse or circuit breaker" (8, c), it may be provided with a link bolted to eyes on the cable, which may be removed when it is desired to disconnect the neutral because the transformers are in parallel for any reason.—[Ed. E.E.]

### A TUNGSTEN FOCUS LAMP

THE British Thomson-Houston Co. (Mazda House, Upper Thames Street, E.C.) have brought out a new concentrated filament Mazda lamp with the object of approximating as closely as possible to a point source of light for focus work.

MAZDA CONCENTRATED FILAMENT FOR FOCUS LAMPS. (Full size.)

The arrangement of the filament is shown in the illustration. The lamp is made in three sizes—50 watts, 100 watts and 200 watts—and for pressures of 12 volts upwards, but we understand that the 200-volt sizes are not yet stocked. The filament is of drawn tungsten wire wound in a very narrow spiral which is formed into a series of loops bunched closely together. By this means it is possible to get a very high candle-power filament in a small compass. For example, the 100-volt 100-watt lamp (giving approximately 100 c.p.) has a filament which could be contained in a space measuring  $\frac{1}{2}$ -in.  $\times$   $\frac{3}{4}$ -in.  $\times$   $\frac{3}{4}$ -in. This lamp has been designed for use with parabolic reflectors in motor headlights and searchlights, and in magic lanterns, photographic enlarging lanterns and small cinematograph projectors. For these purposes it has all the advantages of the ordinary incandescent electric lamp in regard to cleanliness and safety, in addition to the concentrated light source. Neither gas nor oil lamps, owing to the necessity for ventilation, can be set back in deep reflectors as can be done with the new Mazda lamp with consequent gain in efficiency. The lamp thus provides a very effective light source for all purposes where it is desired to throw a powerful beam of light in one direction.

### STAGE AND THEATRE LIGHTING APPLIANCES

A VERY complete new catalogue of stage and theatre lighting appliances has been issued by the General Electric Co. (67 Queen Victoria Street, E.C.). The firm were about the first to realise the necessity of specialising in theatrical requirements. They were the originators of Lyons' liquid resistance dimmers, they were one of the earliest makers of stage arc lamps, and they manufacture and sell the only arc-lamp carbons made in this country.

Among other appliances described in the list are the following: stage arc lamps and accessories; liquid and metallic dimmers and other resistances; Osram drawn-wire lamps and Robertson lamps; cinematograph arc lamps and projectors; small motors for cinematograph machine work; various types of batten, electric fixtures, motor-generators, &c. An interesting appliance is the "Applebee" patent screen or "Spotlight" shutter, which can be fitted to any stage arc lamp. It is attached to the inside of the lamp and operates

from the back. By its use strong shadows can be avoided and a gradually diminishing light obtained. A clear mica slide which is provided prevents the projection of prismatic colouring upon the focussed object. All the gradation is under perfect control. Attention may also be called to the "Hawkins" and "Morehen" plugs. The feature of the former, which is illustrated, is that by means of detachable pins male or female contact can be made. The latter is

HAWKINS PLUG WITH REMOVABLE PINS.

intended to be fixed under the stage level and provides an easy and safe method of taking temporary leads to portable stage properties. The "Morehen" plug has no projecting pins, and if used as the live end, may even be dropped on a metal floor without danger of short-circuiting. Everything in the new list has been designed to meet the regulations of the London County Council. We also understand that the G.E.C. maintain a special Despatch Dept. to facilitate the prompt delivery of all theatrical material ordered from them.

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**FEED-WATER HEATING AND SOFTENING.**—A booklet from Erith's Engineering Co., Ltd. (70 Gracechurch Street, E.C.). The "recording heater" there described shows the water in fine particles over a series of cataracts, through an oil free steam bath, thus driving off carbonic acid, &c., through a vent pipe, which also provides a free escape of steam when a surplus is admitted. A special weir box is used in connection with the recorder, which works with a float. The apparatus is also combined with softening plant.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**MAGNETIC TESTING.**—A pamphlet from Siemens Brothers & Co., Ltd. (Woolwich), contains a reprint of an article on magnetic measurements in iron and steel works, and describes apparatus for carrying out tests of bars, bundles of strips, complete uncut sheets by various methods, as well as for testing permanent magnets.

**VACUUM CLEANERS.**—An illustrated booklet from Scholey & Co., Ltd. (151 Queen Victoria Street), draws attention to the Frantz electric suction cleaner, which, although of the self-contained class with motor suction-fan, dust-collector and nozzle all attached to the handle, only weighs 9 lb. complete. A special feature is the revolving brush within the nozzle, which is worked entirely by the passage of the air, and the blast of compressed air from an outlet in front of the nozzle. The apparatus can also be used as a stationary machine, with flexible suction or blowing hose if required.

**Scottish Local Section of the Institution of Electrical Engineers.**—The annual report refers to six meetings that have been held during the session in addition to the summer meeting of the Institution at Glasgow last June, the annual dinner and a smoking concert. The membership of the Section (including forty students and nineteen graduates) is 390. The following are the office-bearers for next session.—Chairman: Mr. J. A. Robertson (Burgh Electrical Engineer, Greenock); Vice-Chairmen: Mr. J. Lowson and Mr. T. B. Murray (Albion Motor Car Co.); Past Chairman (ex-officio members of Committee): Mr. S. Mavor (Mavor & Coulson), Mr. F. A. Newington (City Electrical Engineer, Edinburgh), and Mr. W. M'Whirter; Chairman of Students' Section: Mr. A. Page (Glasgow Electricity Supply Dept.); ordinary members of Committee: Mr. D. A. Starr (General Manager, Clyde Valley Electrical Power Co.), Mr. J. K. Stothert (Babcock & Wilcox), Mr. J. F. Nielson, Mr. W. L. Spence, Mr. M. B. Field (Kelvin & White), Mr. J. H. Bunting (Bruce Peebles & Co.), Mr. J. S. Nicholson (Glasgow University), Mr. E. T. Goslin (Glasgow Corporation Tramways), and Mr. G. Stevenson; Hon. Sec. and Treasurer: Mr. J. E. Sayers (Sayers & Caldwell); Assistant Hon. Sec.: Mr. W. F. Mitchell (Edinburgh Electricity Supply Dept.). It is mentioned in the report that the fortnightly publication of the Institution Journal will commence in January, 1914.

## A NEW CONSTANT PRESSURE VARIABLE SPEED TRAIN LIGHTING DYNAMO

THE latest train or automobile lighting equipment using a single battery is that due to Gavan Inrig, Ltd. (154 Bishopsgate, E.C.4.), and known as the "Carléon" system, an experimental set which we had the pleasure of witnessing in operation on Tuesday last. However, until the equipment is given a thorough test under the onerous conditions of railway service it is difficult to say exactly how far the system will be able to compete with those already giving satisfactory results. The construction of the dynamo itself is very ingenious. Briefly, one may say the armature winding is supported on an iron tube fixed to one end of the field magnet casting, while a cone-shaped laminated core can slide in and out under the coils. One end of this is attached to a Pickering governor co-axial with the armature shaft. The other end of the governor is attached to a projection which, as the speed of the armature increases, is drawn in by the governor, and at a predetermined time closes the dynamo

circuit through a very ingenious Q.B. switch. This end of the governor then comes in contact with a stop on the shaft and the other end acts on the coned core, drawing it out of the armature and thereby increasing the armature reluctance, so that the dynamo pressure is kept constant. On the speed decreasing, the same operations are reversed. The illustration shows a section through the dynamo, which weighs about 135 lb. for an output of 30 amperes at 25 volts. It should be mentioned, however, that the switch there shown was not satisfactory, and is not now used. It is proposed to adopt a short chain drive, except for automobile work, in certain cases. Over a speed range of 6 to 1, or 500 r.p.m. to 3,000 r.p.m., the pressure of the system appears to vary about 3 volts or so, but, as stated above, a more complete test under service conditions must be made, when it will be seen whether the dynamo can keep the battery in good condition. There are no external switches or regulators, so that the connections are as simple as possible. The design of the dynamo is covered by Patents noticed in the ELECTRICAL ENGINEERING Patent Record, Vol. VIII., p. 390, July 4th, 1912, and p. 724, Dec. 26th, 1912.

**Finsbury Technical College O.S.A.**—The seventh annual smoking concert will be held at the Waldorf Hotel (Aldwych, W.C.) on Friday, April 25th, at 8 p.m., when the Chair will be taken by the President, Mr. Julian L. Baker. Early application for tickets, price 1s. each is requested to Mr. R. W. Clarke (Avon House, Prince's Road, Buckhurst Hill, Essex).

**Claim for Payment for Metal Filaments.**—On April 10th a King's Bench action by the Brimsdown Lamp Works, Ltd., to recover about £113 for tungsten colloid filaments supplied to the firm of Halé & Co. was heard by Mr. Justice Rowlatt and a common jury. The chief point in the action was whether the filaments were supplied by Mr. Scharrer, late general manager to the Brimsdown Company, in a private capacity or in his capacity as representative of the Brimsdown Company. None of the correspondence, including invoices, &c., apparently bore the Brimsdown Company's address nor contained any reference to that company, but it was proved that Mr. Halé had been on several occasions to the works. Judgment was given for the Brimsdown Company.

## ELECTRIC TRACTION NOTES

Another, and we trust the last, of an unfortunate series of breakdowns occurred at the Greenwich power-house of the L.C.C. tramways at about 9 a.m. on Monday. The piston of one of the vertical cylinders of one of the large reciprocating sets was forced through the cylinder cover, and one of the pieces fell on to the alternator. Fortunately no one was injured. The resultant short-circuit burst a trifurcating box on one of the switchboard circuits. All the machines were running, and the damage done by the arc (which was nearly 12 ft. long) was serious. It took about two hours to clear up and get the station running again.—At the meeting of the London County Council on Tuesday evening a report was presented on the previous accidents, full particulars of which were published in our columns at the time, and a brief statement was also made as to last Monday's breakdown. In the course of the debate, Sir Edward White, Chairman of the Highways Committee, said that in addition to their resources at Greenwich, they had a contract with the Metropolitan Electric Tramways, Ltd., to supply them with a certain amount of power, and under that contract power was being supplied to them now. They had also a contract with one of the public authorities, and cables were being laid down in order to give them a third string to their bow.

A tramway collision occurred early on Tuesday morning in Seven Sisters Road, in which four persons were injured. It appears that one car for some reason got out of control and, gaining speed, crashed into the back of another car and, becoming derailed, mounted the pavement and dashed into a shop-front.

It is stated that in order to meet, to some extent, the reduced traffic receipts on the L.C.C. tramways, the Council is making an application to the various authorities through whose areas their tramways run to reduce the assessments.

A House of Commons Committee has passed that portion of the Southport Corporation Bill which gives powers to run trolley omnibuses along the esplanade and promenade.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The appeals by the Post Office and the cross-appeals by the National Telephone Co. against the award of the Railway and Canal Commissioners as to the purchase-price of the Company's undertaking, came before the Master of the Rolls and Lords Justices Buckley and Kennedy on Tuesday and Wednesday last. Mr. Danckwerts, K.C., for the Company, took a preliminary objection that there was no appeal from the award of the Railway and Canal Commissioners, who were acting as "contractual arbitrators" between the parties. The Attorney-General, for the Post Office, argued that the award was made under the "jurisdiction of the Court of the Railway and Canal Commission," and therefore points of law arising from the award were appealable. The Master of the Rolls and Lord Justice Kennedy read the law as giving a right of appeal in this case, but Lord Justice Buckley took the opposite view. Right to appeal was therefore given by a majority of the Court. Sir Alfred Cripps, K.C., then asked for the appeal to be held over till this point was decided by the House of Lords, and the Attorney-General agreed. The appeal to the House of Lords will be made at once, and may be quickly decided, but it is hardly probable that, in the event of their upholding the decision of the Court of Appeal, the points of law on the award will be argued until after Whitsun.

The week's "sensation" in the Marconi Inquiry was a reference, in the course of the evidence of Mr. Godfrey Isaacs (Managing Director of the Marconi Co.), to "rumours" that the attack on Cabinet Ministers had been organised by a group of people with the definite object of promoting the Poulsen

# "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

## Specifications Published April 10, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

6,404/12. **Time Switches.** H. S. HATFIELD (Germany). To make or break a circuit after fixed intervals a fluid is enclosed in a tube of special shape, in which is a porous plug through which the fluid can escape from one part to another. This action may cause the tube to move, and so control a circuit, or a conducting fluid may be used which will short-circuit the terminals of a circuit inserted in the tube, or this may be effected by a liquid like mercury, which is acted on by the fluid. Various means may be used to reset the switches. Their use in prepayment meters, where they are reset by the insertion of a coin, is contemplated. Five figures.

6,990/12. **Circuit Breakers.** E. O. MÖLLER (British Westinghouse). To ensure that the circuit shall be opened under any of the usual conditions certain connections through resistances and shunts are made. For overload and reverse there is a shunt in the main circuit. The trip coil in series with a comparatively big resistance is connected from one end of the shunt to the opposite pole, while another resistance is connected to this pole from the other end of the shunt. Resistances and a hot wire relay, controlling the circuit-breaker coil and the main shunt from the secondary of a transformer, whose primary is in the main circuit, and from the secondary of another transformer whose primary is in shunt to the main circuit, may be used for A.C. circuits. Modifications are made for other forms of protection. Seven figures.

7,242/12. **Wireless.** F. J. CHAMBERS. Polarised waves of audible frequency are emitted from long conductors laid parallel to, and insulated from, the earth. A parallel conductor may also be embedded in the earth, laid on its surface, or insulated from it. Condensers connect the two conductors, by which the natural frequency is adjusted. Inductances may also be inserted. If continuous radiation is employed a Morse key can be used for transmitting, but if impulsive excitation is used two different frequencies are used. Five figures.

8,640/12. **Instrument and Machine Slip-ring Collectors.** A. DENNY and F. T. EDGEcombe. A spring-controlled plunger is connected to a semi-elliptic conducting leaf spring by an adjustable catch. Two figures.

12,367/12. **Vacuum Electric Water-Heaters.** T. MANN. The resistor is carried on the water tubes, and is surrounded by a vacuum. (See ELECTRICAL ENGINEERING, Vol. VIII., p. 480, August 29th, 1912.)

16,708/12. **Telephone Lightning Protectors.** B. T.-H. (G.E.C., U.S.A.). Metal and oxidised non-metal blocks are arranged alternately, separated by spark-gaps. Alternatively oxidised metal blocks and refractory blocks may be used. Aluminium and graphite are proposed. Three figures.

20,248/12. **Self-Cleaning Spark Plugs.** J. J. THOMPSON (U.S.A.). The insulating material is inserted from the bottom to prevent escape of gas, and to adjust the gap one terminal is provided by the bushing nut, which is threaded on the lower end of the plug. To prevent it getting fouled by oil or carbon the lower electrode is made in the form of a cage, within which is a free metal ball. Six figures.

1,205/13. **Variable Speed Dynamos.** T. W. TATTERSALL. To regulate the output of an automobile axle-driven dynamo three field windings are provided, viz.: shunt and series windings and a balancing series winding, which is in series with an iron wire or other resistance having a high positive temperature coefficient. One figure.

5,545/13. **Variable Speed Differential Dynamos.** C. F. KETTERING (U.S.A.). So that the machine may build up rapidly there is in parallel with the series winding an iron wire resistance so that initially the series field is short-circuited, but as the current increases so does the resistance of the iron, and more current passes through the series coil. One figure.

## Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad. Summaries of some of the more important of these patents will appear in our next issue.

**Arc Lamps:** B.T.-H. (G.E.C., U.S.A.) [Electrodes] 13,375/12.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** B.T.-H. and WEDMORE [Distributing] 28,868/11; DUBILIER [Utilisation of transformed and primary currents] 6,909/12; SUNDERLAND and PILLINGER [Automatic control of engines, dynamos, and batteries] 7,375/12; HEPBURN [Continuity joint for cable armouring] 13,171/12; WINSCH [Contact box for motor-mains connection] 18,992/12.

**Dynamos and Motors:** BROWN, BOVERI [Brush-holders] 7,577/12.

**Electrometallurgy and Electrochemistry:** KENNEDY and BRITISH ARC WELDING Co. [Welding] 8,987/12; DU PONT [Obtaining oxides of nitrogen from the air] 17,038/12.

**Ignition:** KETTERING, 29,091/12.

**Instruments and Meters:** WHITIE and LANGLEY [Recording coal supplied to boilers] 7,885/12; BAUER [H.P. electrometers] 25,101/12.

**Storage Batteries:** CLARK [Corrugated boxes] 10,766/12.

**Switchgear, Fuses, and Fittings:** B.T.-H. (G.E.C., U.S.A.) [Relays for control systems] 7,014/12; [Motor control] 8,611/12; BEUTTELL and MANNERS-SMITH [Reflectors for linear light sources] 14,719/12; KLING and HORTON [Switches] 16,229/12; MOFFETT & ROSHER [Motor-starters and controllers] 20,113/12; TASSO [Fuse] 21,540/12.

**Telephony and Telegraphy:** MELLINGER [Telephony] 7,100/12; GRISSINGER [Telephony] 7,482/12; [Repeater circuits] 2,929/13; [Lines] 2,931/13; [Receivers] 3,587/13; [Substation circuits] 3,780/12; LAGUS [Telephones] 11,578/12; POPE [Telegraph apparatus] 11,605/12; THOMPSON (Ges. für Drahtlose Telegr.) [Producing oscillations] 16,827/12; SIEMENS BROS. & Co. (Siemens & Halske) [Electro-magnetic telegraphic perforator] 26,306/12.

**Traction:** KETTERING [Starting systems for internal combustion engines] 28,903/11 and 29,071/12; CROMPTON & Co., MACFARLANE and BURGE [Motor control] 4,995/12.

**Miscellaneous:** JAMES and SMITH [Protecting submerged structures from barnacles, &c.] 7,317/12; SIBLEY [Piano-players] 7,370/12; B.T.-H. (G.E.C., U.S.A.) [Dash-pots] 15,070/12; WORTMANN [Tilling machines] 15,638/12; SOU [Blasting detonators] 16,963/12; BATES, KELLY and CORBIN [Cinematograph targets] 17,536/12; "VULKAN" MASCHINENFABRIKS [Clutches] 20,922/12; BIGGE and BUTTE [X-ray photography] 28,677/12.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Distributing Systems, Insulating Materials, Cables and Wires, &c.:** BROWN, BOVERI [Conductors] 6,036/13.

**Electrometallurgy and Electrochemistry:** PERREUR, LLOYD [Electrolytic production of copper] 6,897/13.

**Ignition:** RUYSSENAERS [Regulating] 6,544/13.

**Incandescent Lamps:** KREMENEZKY [Manufacture of ductile tungsten filaments] 3,112/13.

**Switchgear, Fuses and Fittings:** SIEMENS, SCHUCKERT [Sockets] 5,903/13; [Fuse] 6,880/13; POLLAK [Interrupters] 6,122/13.

**Telephony and Telegraphy:** HILL [Selective signalling] 2,612/13; SOLDATENCOW [Electro-magnetic perforator] 5,352/13; BETULANDER [Selectors for automatic telephony] 6,465/13; SIEMENS & HALSKE [Semi-automatic telephony] 6,664/13; [Registering subscribers' calls] 6,936/13.

**Miscellaneous:** MARELLI & Co. [Oscillating fans] 6,496/13; HARTMANN & BRAUN [Gyro-compasses] 6,570/13; A.E.G. [Clock control] 6,934/13.

The following Amended Specification may now be obtained.

**Traction:** S. ARNOLD [Luggage transporter] 22,406/11.

## Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

8,223 of April 19th, 1899. **Testing Primers and Batteries.** G. C. FRASER and G. K. B. ELPHINSTONE. To test firing primers and batteries, a dead-beat ammeter movement and an adjustable rheostat of about 50 ohms are contained in a portable case. Marking the dial to obtain direct readings for resistance values is claimed.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Distributing Systems, &c.:** ATELIERS THOMSON-HOUSTON [Induction motor control with subsidiary motor] 25,979/06.

**Dynamos, Motors and Transformers:** R. H. BARBOUR [Flexible copper brushes wholly or partly encircling the collector ring] 28,482/07; MATHER & PLATT (E. Rosenberg, Berlin) [Motor-generators and rotary converters] 28,530/07.

**Electrochemistry:** J. Y. JOHNSON (Badische Anilin und Soda Fabrik, Germany) [Chromic acid by electrolysis] 27,009/05; M. RUTHENBURG [Electrolysis of brine] 29,655/06.

**Incandescent Lamps:** A. G. BLOXAM (J. Luz, Vienna) [Manufacture of tungsten filaments] 27,002/05.

**Storage Batteries:** A. J. BOULT (E. F. Stebbins, U.S.A.) [Adding barium or strontium sulphate to active material] 26,876/05.

**Switchgear, Fuses and Fittings:** J. GUNNING [Time switch] 25,567/99; A. P. and G. C. LUNDBERG [Fixing tumbler switch covers to base] 25,622/99; W. W. STRODE and G. H. WHITE [Flush pattern tumbler switches, wall plugs, &c.] 28,252/04.

interests by preventing the ratification of the Marconi agreement. No evidence was given, however, to prove that these rumours were founded on fact. Mr. Isaacs also showed a draft prospectus of a Poulsen system, containing a report by Mr. A. A. Campbell Swinton; he maintained that, if Sir Henry Norman knew that Mr. Swinton had reported in a prospectus in favour of the Poulsen system, he should not have recommended him to the Committee as an independent expert. A large blue-book is now available containing the full report of the proceedings before the Committee up to February 12th last.

Communication between Pahang and Malacca was restored some time ago, as well as with Bucoio, Quimball, Bailundo, Balombo and Bihé, in Angola, on the 10th inst.—The Compagnie Francaise des Cables Télégraphiques has again suffered a breakdown of their cable between Paramaribo and Cayenne, thus cutting off their route to French Guiana and Brazil.—Also all communication was cut off between Saigon and Bangkok from the 11th to 12th inst.—The cable between Tokio and Guam was repaired on the 13th inst.—Some repairs are also being undertaken to cables between Key West and Havana.

### LOCAL NOTES

**Accrington: Rateable Value System of Charging.**—The Council has approved a proposal of the Electricity Committee to have an optional tariff on the basis of 12½ per cent. on the net rateable value of the house, plus ½d. per unit for all energy consumed.

**Colwyn Bay: Supply in Bulk.**—The North Wales Power Co. have suggested a supply in bulk to the Council as a possible way to obviate the need for an expenditure of £5,000 upon enlarging the municipal electricity works. The matter has been referred to a special committee.

**London: Hammersmith: Hiring of Arc Lamps.**—A reduced scale of charges for the hiring out of arc lamps is recommended by the Electricity Committee. Considerable reductions will be obtainable on a four years' contract.

**Lytham: Electric Supply.**—The Board of Trade has granted an electric lighting provisional order to the Council. At the recent local inquiry, the St. Anne's-on-Sea Council also made an application for an order for Lytham.

**Portrush: Electric Lighting Scheme.**—A Board of Trade inquiry is being held in regard to an electric lighting scheme for this district.

**Reading: Change of Frequency.**—For many years the Reading Electric Supply Co. has been generating single-phase alternating current at the unusual periodicity of 67 periods per second, which obviously has made it more difficult for their consumers to obtain electrical apparatus. The Company now proposes to adopt the standard frequency of 50 periods per second, and a favourable report upon the proposal has been made by the General Manager and Engineer of the Corporation Tramways Department.

**St. Andrews: Street Lighting.**—The Council has approved of the Electric Supply Corporation putting down an experimental installation of street electric lighting.

**Scarborough: Purchase of Local Supply Co.**—The Corporation having under consideration the possibility of purchasing the undertaking of the Scarborough Electric Supply Co., permission has been asked of the Company to an examination of its plant by a consulting electrical engineer.

**Sheffield: Rateable Value System of Charging.**—The proposal of Mr. S. F. Fedden, Manager of the Electricity Department, to adopt the rateable value system of charging on the basis of a fixed annual charge of 10 per cent. on the assessment, plus ½d. per unit for all consumption, has been passed by the Corporation.

**Stoke-on-Trent: The New Power House.**—The new power house, which was described in last week's ELECTRICAL ENGINEERING, was formally inaugurated on Thursday last by Alder-

man Leese, Chairman of the Electricity Committee, in the presence of a large gathering.

**Waterford: Electric Supply.**—As we recently announced, the Waterford Gas Co. has received a report from Mr. C. H. Wordingham upon the question of an electric supply undertaking in the town, and, acting upon the advice in this report, notice has now been given to the Corporation of the Gas Company's intention of applying for an electric lighting provisional order.

### TENDERS INVITED AND PROSPECTIVE BUSINESS

#### Generating Stations, Sub-Stations, Mains, &c.

**Birmingham.**—After careful consideration, the Electric Supply Committee have decided not to instal gas engines for the first portion of the large extension scheme, but to adopt steam turbines. This decision has been come to on the advice of Mr. R. A. Chattock, the City Electrical Engineer, and a detailed report will now be presented to the Corporation.

**Carlisle.**—A loan of £7,500 for additional plant is to be applied for.

**Dublin.**—E.H.T. sub-station switchboard and accessories. Also alteration to existing E.H.T. switchboard. (Chairman, Electricity Committee, Cork Hill. May 1st. (See an advertisement on another page.)

**Dundalk.**—A Local Government Board inquiry is to be held into an application for a loan of £5,000 for electric light extensions.

**Grimsby.**—The Council have decided to make application to the Local Government Board for sanction for the following loans: turbine and condensing plant, £7,500; switchboard and cable, £300; pipework, £600; foundations, £250; additional feeder panel, £100; extension of cooling tower, £200; oil separator, £150; and contingencies, £200.

**King's Lynn.**—Tenders are invited for one 400-kw. steam dynamo with condensing plant and pipework. May 5th. (See advertisement on another page.)

**London: Bermondsey.**—A loan of £1,500 for the electricity undertaking has been sanctioned by the London County Council.

**Newport (Mon.).**—At the last meeting of the Council the Chairman of the Electricity Committee stated that in order to keep the capacity of the power station up sufficiently to meet the prospective demand, an expenditure of £10,600 would be necessary.

**Swansea.**—The Electrical Engineer has prepared plans and specifications for extensions at the generating station.

**Whitehaven.**—The Local Government Board has sanctioned loans of £665, £300 and £600 for excess expenditure on plant, mains extensions and house services respectively.

**Wolverhampton.**—The Electricity Committee recommend that application be made to the Local Government Board for a further loan of £15,000 for mains extensions; £5,000 for sub-station equipment; and £2,000 for E.H.T. switchgear.

#### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Batley.**—Villa residence, Grange Estate. Architects, W. Hanstock and Sons. April 8th.

**Hull.**—Electric lighting of Saner Street school. Chairman, Education Committee, Town Hall. April 24th.—Electric lighting of Stepney Lane and Cleveland Street workshops and stables. City Engineer, April 23rd.

**London.**—New fire station at St. John's Wood.

**Sheffield.**—Institution for crippled children. A. W. Kenyon, 8A George Street.

**Swansea.**—Cinematograph theatre, Oxford Street. Architect, C. T. Ruthen, Bank Chambers, Heathfield.

**York.**—Knavesmire elementary school. Education Offices.

#### Miscellaneous

**Australia.**—1,600 incandescent lamps. Specification, 72 Victoria Street, S.W., or 73 Basinghall Street, E.C.

**Durban.**—The Corporation require a complete electric meter-testing equipment. Town Clerk. May 28th. Specification, &c., at 73 Basinghall Street, E.C.

## TENDERS RECEIVED AND ACCEPTED

**Dublin.**—The Electricity Committee recommend the acceptance of the following tenders, which are the lowest in each case received:—Babcock & Wilcox, boiler plant, £11,024; Worthington Pump Co., circulating water pipes, £1,346; British Reinforced Concrete Engineering Co., £5,929; The New Conveyor Co., £6,302.

**Halifax.**—The tender of Chamberlain and Hookham for meters has been accepted.

**London: L.C.C. Tramways.**—The tender of the British Electric Transformer Co. for transformers for the Shoreditch tramway sub-station has been accepted at £4,380. Three other tenders were received, and the accepted tender was not the lowest.

**Battersea.**—The tender of Babcock and Wilcox for a water-tube boiler, &c. (£1,920), has been accepted, and that of Callender's Cable and Construction Co. for troughing and bends for cables, &c.

**Manchester.**—The following tenders have been accepted by the Electricity Committee:—Callender's Cable & Construction Co. for twelve-months' requirements of low-tension distribution cables; Electrical Engineering & Equipment Co. for paper insulated cable; and Liverpool Electric Cable Co. for rubber insulated cable. The Education Department have accepted the tender of Messrs. T. Anderson, Ltd., for the electric wiring and fitting of the new municipal school in George Leigh Street.

**Southend.**—Venner Time Switches, Ltd., have been awarded a two years' contract for demand limiters.

**West Hartlepool.**—The Bastian Meter Company's tender has been accepted for the supply of 2½ and 5 ampere meters.

**Wolverhampton.**—A contract for a twelve-months' supply of traction-type Tantalum lamps has been placed with Messrs. Siemens Bros. Dynamo Works.

Messrs. Siemens Bros. Dynamo Works have received further contracts for the supply of Tantalum traction lamps from two of the largest Corporation tramway undertakings in Yorkshire. In addition, they have also received a contract for the supply of Wotan lamps for shed and general tramway lighting other than cars.

## APPOINTMENTS AND PERSONAL NOTES

The following were selected for the first short list for the appointment of Chief Engineer and Manager of the Hampstead Council's electricity undertaking: H. Richardson, Chief Electrical Engineer, Dundee; T. C. Parsons, late Chief Engineer, Govan; W. Wyld, Chief Electrical Engineer, Birkenhead; G. R. Spurr, Electrical and Tramways Engineer, Walthamstow; F. W. Purse, Chief Electrical Engineer, Watford (who has since been appointed to the vacancy at Carlisle); and J. H. Bolam, Chief Electrical Engineer, Weymouth. The Electricity Committee selected the first four of the above-named for the Council to make its final selection this (Thursday) evening, but we learn that Mr. Richardson has withdrawn his application, so that Mr. Parsons, Mr. Wyld, and Mr. Spurr are the final candidates.

Mr. C. M. Davis, of Bristol, has been recommended by the Hampstead Committee for the vacancy of Consumers' Engineer recently advertised. The recommendation will come formally before the Council to-day fortnight.

In consequence of Mr. H. H. Saunders, who, as we announced last week, has been appointed General Manager to the Lowestoft Corporation, having to relinquish certain private work under the new arrangement, his salary is to commence at £250 per annum instead of £220, and will rise to £280 by yearly increments of £10.

Mr. E. J. Cochrane, Chief Assistant Engineer to the Sydney Corporation, is to be sent on a trip to Europe and America in order to study methods of electric generation.

The Dublin Port and Docks Board are recommended to appoint an electrical engineer in view of the growing importance of the electrical equipment of the Port.

A shift engineer is required at Heywood, at a salary of 26s. per week.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith and Son, of 5 Philpot Lane, E.C. inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £72 to £72 10s. (Last week, £71 10s. to £72.)

**Simplex Heating and Cooking Apparatus.**—In order to differentiate their various electrically-heated appliances from their other manufactures, Simplex Conduits, Ltd. (116 Charing Cross Road, W.C.), have registered as a descriptive mark the

name *jeleXaim*

**Concert.**—The Fourth Annual Bohemian Concert of the Athletic Club of Electrical Installations, Ltd. (27 Martin's Lane, Cannon Street), was held at the Oval Hall, Kennington, on April 9th. Mr. S. C. Russ opened the proceedings with a short speech, and an excellent programme was given.

**The Adams Manufacturing Co.**—An order was made on Saturday last by Mr. Justice Swinfen Eady, appointing Mr. Lewis Hardy Receiver and Manager on behalf of the debenture holders of this Company. No interruption will be caused in carrying on the business, as the Receiver, under leave of the judge, is to continue its business. Arrangements for the reconstruction of the Company are in process of being made.

**Van Horse Parade.**—Siemens Bros. Dynamo Works, Ltd., Tyssen Street, Dalston, have been given both first and second prizes at the recent London Van Horse Parade in Regent's Park.

**Plant for Sale.**—The whole of the machinery and plant, including Diesel engines and generators, at the Yardley generating station of the Birmingham Tramways Department, is for sale on account of the closing down of this station. (See advertisement on another page.)

**Liquidations.**—The Directors recommend the winding-up of the Electrolytic Alkali Co., and that Mr. W. H. Alexander be appointed liquidator.

## COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &amp;c.

**South Wales Electrical Power Distribution Co.**—At the annual meeting last week it was stated that in order to meet the increased demand, an additional 5,000 kw. generating set, with boilers, &c., has had to be installed. The chairman expressed the opinion that at no very distant date the company would be able to resume payment of the interest on the old debenture stock.

**Bromley Electric Light Co.**—At the meeting last week a dividend at the rate of 8 per cent. for the second half-year, making a total of 6 per cent. for the year, was declared, with £4,000 carried to reserve, and £1,544 carried forward. Although there had been a very fair increase in the lamp connections, the revenue had hardly gone up in proportion.

**A New Osram Lamp.**—As will be seen from an announcement in our advertisement columns, the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.) are putting on the market a smaller size of 200/260-volt, drawn-wire Osram lamp than they have produced before. The new lamp, which should have a considerable field of utility on account of its economy in current consumption, takes only 15 watts, and is rated at 11 British candle power.

**Obituary.**—The death, on April 6th, of Prof. A. Slaby, at the age of sixty-four, is announced from Charlottenburg. Prof. Slaby, who will be chiefly remembered in connection with his pioneer work in wireless telegraphy, was one of the chief lecturers at the Technische Hochschule, Berlin.

We regret to record the death of Mr. E. B. Bright on Monday last, at the age of eighty-two. Mr. Bright did a considerable amount of pioneering work in telegraphy, and in particular he will be remembered in connection with the laying of some 5,000 miles of submarine cables in the West Indies during 1869-1872. He was a brother of the late Sir Charles Bright.

## SUMMARY

MONDAY was the last day for nominating candidates for the Institution of Electrical Engineers' Council election. Only one has been added to the nominations published in our issue of April 3rd, viz., Mr. R. A. Chattock, of Birmingham. (Page 224.)

A LETTER from M. Latour refers to the patent position regarding single-phase motors in Germany. (Page 224.)

In a Paper by Dr. E. Rosenberg, read and discussed before the Institution of Electrical Engineers in London, Birmingham, and Manchester, on self-

synchronising machines, the various methods of starting were dealt with, and a new method, using a small A.C. motor in series with the synchronous motor or rotary, due to the author, in which rapid starting is obtained, while sparking and current rushes are avoided, was described. (Page 225.)

It was held on Appeal at the Middlesex Quarter Sessions on Monday that the North Metropolitan Electric Power Supply Co. had not infringed the Home Office Regulations by employing a youth under 21 for cleaning work in a sub-station; as he was properly trained and competent he was an "authorised person" under Regulation 28. The youth in question had been killed by touching a live conductor on a section of the switchboard adjacent to the dead one, upon which he had been working, but separated from it by a 2 ft. 6 in. gangway. This gangway, however, was not considered by the magistrates to be a "division" under Regulation 18, but the fine for infringement of this regulation was reduced from £25 to £10 10s. (Page 227.)

A PAPER by Mr. W. E. Milns, read recently before the Birmingham Local Section of the Institution of Electrical Engineers, dealt with a number of points tending towards the successful installation of electric power equipments in works. (Page 228.)

A PAPER by Mr. R. G. Allen on interpoles was read at a recent meeting of the Dublin Local Section of the Institution of Electrical Engineers. (Page 228.)

At the annual festival dinner of the Electrical Trades Benevolent Institution over £800 was collected, and we hope that many more will add their help when they realise the good work the Institution is doing. (Page 228.)

The arrangement of burglar alarms is discussed in our Questions and Answers columns. (Page 229.)

THE "Brighton" series system of incandescent street lighting is briefly described on page 230.

SOME additional notes on the Carléon train lighting equipment are given on page 230.

Two new forms of electric sealing-wax heaters are described and illustrated. (Page 230.)

THE annual report of the Comptroller-General of Patents for the year 1912 states that there was an increase in the total number of applications for patents during that year. The tendency to file Complete specifications with the application is becoming very marked. (Page 231.)

THE evidence before the Marconi Inquiry Committee during the week has dealt mainly with personal matters. A demonstration of the Poulsen system has been made before their Technical Committee. The Postmaster-General has announced that certain privileges are to be granted to the electrical staff taken over from the National Telephone Co. (Page 231.)

THE Telegraph Patent taken out by V. Poulsen in 1899 would expire on the 28th of this month if the petition for prolongation were not granted. The

petition is in the lists for to-day, and we understand that it is practically unopposed. Among the specifications published by the Patent Office on Thursday last is one for a system of keeping the power developed by a motor constant by automatically varying the torque inversely as the speed, this specification being in the names of Crompton & Co., J. C. Macfarlane, and H. Burge. Some mechanical details of a motor controller are also protected by F. J. Moffett and N. B. Rosher. (Page 232.)

A NUMBER of Bills relating to electric traction matters have been before Committees of Parliament during the week.—The proposal of the Hastings Tramways Co. to abandon the Dolter surface contact system along the sea front has been rejected.—The question of contributions towards the maintenance of roads in respect of the running of trolley 'buses and motor 'buses has been discussed before a House of Commons Committee, which is considering a number of these bills, and the principle has been laid down that at the end of three years an arbitration shall be held to determine whether there has been "extraordinary" traffic, if so, an amount of compensation payable by the traffic authority is to be fixed.—An extension of time has been granted for the construction of the Wimbledon and Sutton electric railway. (Page 233.)

THE Dundee Corporation have a Bill in Parliament for the annexation of Broughty Ferry.—An electrical exhibition is to be held in Southampton.—The Walthamstow Council are to supply in Woodford.—Mr. H. R. Hooper, a Local Government Board inspector, made some strong comments at Coventry last week with regard to the application of profits to relief of rates. (Page 235.)

EXTENSIONS are contemplated at Grimsby, £17,800; Lincoln, £12,500; Bridlington, £5,000; and Long Eaton, £10,000.—Two 6,000 kw. turbines are required at Christiania, and two 5,000 kw. three-phase generators and water turbines are required at Winnipeg. (Page 235.)

A DIVIDEND of 9 per cent. is declared on the ordinary shares of Babcock & Wilcox, and a satisfactory year's working is reported by the Lancashire Electric Power Co.; North Metropolitan Electric Power Supply Co. (on the ordinary shares of which 6 per cent. is paid with a bonus of 8s.), and the Midland Electric Corporation for Power Distribution.—Messrs. Johnson & Phillips show a balance of £3,315 after meeting depreciation, &c., but no dividend is paid on the ordinary shares. (Page 236.)

## CORRESPONDENCE

### SINGLE-PHASE MOTOR PATENTS.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—Referring to your statement in your issue of April 3rd inst. (page 113) concerning the German patent No. 153,730/01, I trust you will allow me to observe that the E.T.Z. has pointed out nothing whatever as regards the validity or purport of the said patent. The E.T.Z. has simply published in its issue No. 12 of the current year both a letter addressed to them by Mr. F. Eichberg, and at the same time my own answer to that very letter of Mr. Eichberg's.

I am not acquainted with the decision of the German Patent Office to which Mr. Eichberg referred in his letter to the E.T.Z.; but I do know that there is no patent of Messrs. Winter & Eichberg allowing them to confiscate for their own benefit my essential work on the compensation and commutation of commutator motors, which works have become the basis of the modern conception of such machines.

Believe me, Sir, yours truly,

MARIUS LATOUR.

22 Rue de Toqueville, Paris,  
April 21st, 1913.

## THE INSTITUTION COUNCIL ELECTION

BALLOTING papers for the election of members to fill vacancies on the Council of the Institution of Electrical Engineers will probably be sent out to-morrow. A list of the nominations made by the Council itself appeared in our issue of April 3rd, and other nominations by the membership could be made up to Monday last. Only one other candidate has been proposed, however, namely, Mr. R. A. Chattock (City Electrical Engineer, Birmingham), who, we understand, is being supported by a number of municipal electrical engineers.

There is only one vacancy for ordinary members of Council, and there are now three candidates, Mr. A. L. C. Fell and Mr. G. S. Ram, proposed by the Council, and Mr. Chattock.

Mr. Duddell as President, and Sir Charles Parsons and Mr. J. F. C. Snell to fill the two vacancies as Vice-Presidents, are unopposed.

For the three associate members of Council choice will have to be made from four names, Mr. F. E. Berry, Captain Henrici, Mr. A. W. Martin, and Mr. S. W. Melsom. And for the two vacancies as associates on the Council, there are three candidates, namely, Mr. E. Russel Clarke, Mr. Francis Ince, and Mr. A. M. J. Ogilvie.

We have received the following letter from Mr. W. B. Woodhouse, Manager and Chief Engineer of the Yorkshire Electric Power Co.:—

TO THE EDITOR OF "ELECTRICAL ENGINEERING."

SIR,—Many members of the Institution will, I believe, be disappointed with the Council's nominations to fill the vacancies on the Council. This for two reasons: that the constitution of the Council seems tending to become official rather than commercial; that the local sections have insufficient representation.

The renewed interest in the affairs of the Institution which has shown itself since Dr. Ferranti's presidency, has been due, I think, to the feeling that the programme of development which he outlined would be followed, and that the Institution would become of real practical assistance to the industry. To this end should we not have a greater proportion of business men on the Council?

On the present Council the local sections have, in addition to their special representatives, Messrs. Dickinson, Faraday Proctor, Pearce, and R. K. Morcom. All these gentlemen retire, and the Council's nominees, worthy of the highest honour though they may be, do not represent the provinces in the same direct manner. The local sections want binding closer to headquarters. I believe this can be attained by fuller representation.

Yours faithfully,

W. B. WOODHOUSE.

Thornhill, Dewsbury.

April 15th, 1913.

## ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, APRIL 24TH.

*Institution of Electrical Engineers.*

8 p.m. "On Phase Advancing," by Dr. G. Kapp.

FRIDAY, APRIL 25TH.

*Finsbury Technical College Old Students' Association.*

8 p.m. Smoking Concert at Waldorf Hotel.

SATURDAY, APRIL 26TH.

*Association of Mining Electrical Engineers.*

5.30 p.m. Warwickshire and S. Staffs Branch. At Imperial Hotel, Temple Street, Birmingham. "Automatic Voltage Regulation," by W. J. Belsey.

MONDAY, APRIL 28TH.

*Institution of Electrical Engineers: Newcastle Students' Section.*

7.30 p.m. At Armstrong College. "Cascade Connections," by H. V. Henniker.

*Institution of Civil Engineers: Students' Section.*

8 p.m. At Institution of Mechanical Engineers. Special Lecture on "Law Relating to Engineering."

TUESDAY, APRIL 29TH.

*Illuminating Engineering Society.*

7.30 p.m. At Royal Society of Arts. Resumed discussion on Mr. A. P. Trotter's Paper on "The Specification of Street Lighting."

*Institution of Civil Engineers.*

8 p.m. Annual General Meeting at Institution of Mechanical Engineers.

## The London Electrical Engineers.

(TO-DAY) THURSDAY, APRIL 24TH. *C. Company.*—Recruit Training, 7 to 8 p.m. Hopkinson Cup Competition, 7 to 10 p.m.

FRIDAY, APRIL 25TH. *D. Company.*—Recruit Training, 7 to 8 p.m. Hopkinson Cup Competition, 7 to 10 p.m.

SATURDAY, APRIL 26TH. *Headquarters* open from 10 a.m. till noon.

MONDAY, APRIL 28TH. *A. Company.*—Recruit Training, 7 to 8 p.m. Co. Training, 7 to 10 p.m.

TUESDAY, APRIL 29TH. *B. Company.*—Recruit Training, 7 to 8 p.m. Co. Training, 7 to 10 p.m.

## SELF-SYNCHRONISING MACHINES

A Paper by Dr. E. Rosenberg (British Westinghouse Electric and Manufacturing Co.), bearing the above title and dealing with self-starting synchronous motors and rotary converters, was read and discussed at the Institution of Electrical Engineers on Thursday last, at the Manchester Section on April 1st, and at the Birmingham Section on April 9th.

It is far cheaper, from the point of view of general economy, said the author, to make the machines in the power station and the cables big enough to carry the magnetising current in addition to the watt current, and to let the power factor look after itself. If, however, opportunity arises of replacing large motors of bad power factor by synchronous motors, which may be made to take a leading current, then it may be a decided gain and far outweigh the additional complication involved. One of the most useful applications of the self-starting synchronous motor is for motor-generators, as the starting torque is usually only small. The synchronous motor works as an induction motor during starting, but in order to obtain stability and overload capacity the motor must be primarily a synchronous machine, though modified induction motors may be used; but in any case heavy damping windings, to prevent hunting, must be used. These should be either squirrel-cage or at least two-phase closed windings. Instances are given in the Paper of two 800-kw. frequency changers, built by the British Westinghouse Electric and Manufacturing Co., Ltd., each consisting of a 14-pole motor for 60 cycles, coupled to a 6-pole generator for 25.7 cycles. The rotor of the 60-cycle motor has laminated poles fitted with a squirrel-cage, while the 25.7-cycle generator has solid cast-steel poles and no other damper. Tests have shown, however, that the set can be readily started up from either side with the field coils open or short-circuited, the action of the dampers reducing the open-circuited field pressure as low as a fourth of that calculated on the ratio of the number of turns, but a quicker start can be obtained with the field coils open-circuited. Due to the heavy pulsations of speed immediately before synchronism and to the nearly momentary reversal of the magnetism of each pole when one is slipped just before slipping into synchronism, violent oscillations can be seen on an ammeter in the field circuit.

The short-circuited field winding represents practically a second squirrel-cage, incomplete because it is a "single axis" (single-phase) winding, and because it is shaded to a great extent and only traversed by a part of the flux. But it will reduce the starting torque in the same way as a reduction in the resistance of the main squirrel cage, and also a reduction of torque when passing through half synchronous speed. On the other hand, the machine can approach nearer to synchronous speed as an induction motor, though the theory of the induction motor is no longer applicable; but the squirrel cage must bring the rotor up to a speed near enough to synchronous to enable the synchronising power of the machine to accelerate the rotor from this point to synchronous speed. It is then shown that for a smooth, cylindrical, laminated rotor with distributed winding, and excited with direct current, the limiting condition for pulling into synchronism is that the amplitude of the superimposed speed oscillation  $s_1$  should be equal to the average slip  $s$ , or the limiting value of  $s_1 = s = \frac{L_{sc}}{L_{sc} + (89.2 \times n \cdot s \cdot M r^2)}$ , where  $L_{sc}$  is the average value of the synchronising power in kilowatts,  $n$  is the supply frequency,  $M$  is the mass of the flywheel in kilograms, and  $r$  the linear speed of its radius of gyration at synchronous speed in metres per second. This calculation is based on the assumption that the machine is not loaded at all, when it is only theoretically necessary to pull the rotor up just before it actually gets into direct opposition to the supply. If, however, the machine is loaded and is brought up to speed by a squirrel cage, the limit of slip which still allows pulling into synchronism is nearly the same as in an unloaded machine with no squirrel cage, which is brought up to the same slip by an external motor. The limit of the starting torque for which a self-starting synchronous motor can be used is, as a rule, not the torque required for starting from rest, but the torque which can be overcome for pulling into synchronism.

For unexcited machines with salient poles, however, due to the very high reluctance of the gaps between the poles, the magnetic field in the rotor will be so tied to the pole pieces that the magnetic axis of each pole for the greater part of each half period will only move slightly to either side of the geometrical centre of the pole. If the residual

magnetism in the poles is small, the rotor will hang on to the stator field till it lags approximately half the length of one pole, then the lines of force snap and the rotor will slip into the field of the next stator pole and hang on to this. During the moment of snapping there is practically no rotor field to balance the pressure applied to the stator. The stator must therefore at this moment create its field outside. The wattless current in the stator will be very high, and the leakage field so increased as to keep the applied pressure balanced. If there is resistance or reactance in the machine circuit, this will at the moment reduce the terminal pressure. In a machine excited by direct current a considerable drop in terminal pressure may be caused by resistance or reactance in certain cases.

Rotary converters are frequently started, like squirrel-cage motors, from low voltageappings on transformers. In general, the procedure is the same as that described for synchronous motors, but there are two or three aggravating conditions. There is a commutator with brushes always short-circuiting a certain part of the armature, and the field winding is not excited from an outside source, but generally from the D.C. brushes of the rotary. Commutating poles are frequently added, and are not fitted with dampers like the main poles. The short-circuiting of one part of the armature winding will naturally reduce the torque for a given starting current. It also causes sparking during the starting period. To overcome the tendency of such a machine to run at half speed, the commutating pole windings are generally short-circuited during starting. To overcome the trouble of brush sparking during starting, as a rule brush lifting is resorted to, and only one + and one - brush are left on the commutator, so as to enable the operator to recognise the polarity to which the machine excites itself and to change it by pole slipping if necessary.

A new method introduced by the author allows self-synchronising of the rotary with small armature current, prevents sparking on the brushes, and prevents reversal of the field. A starting motor is connected in series with the slip-rings of the rotary. This motor generally is an ordinary squirrel-cage polyphase machine, but the explanation of the method is perhaps simplest by assuming a single-phase rotary and a single-phase commutator motor for starting, as in Fig. 1.

FIG. 1.—CONNECTIONS OF SELF-SYNCHRONISING SINGLE-PHASE ROTARY WITH STARTING MOTOR.

There are no starting tappings on the main transformer. The small switch in series with the single-phase motor is not essential. If the high-pressure switch of the transformer and the switch of the starting motor are closed, the main low-pressure switch being open, the current will flow through the starting motor into the rotary, but is limited to a fraction of the full-load current of the rotary. The rotary armature represents very little impedance. Assuming, for instance, that for full-load current in the rotary the pressure across the slip-rings would be 20 per cent. of the normal pressure, then, if the starting motor is designed to allow 30 per cent. of full-load current to pass through the rotary, the slip-ring pressure will be reduced to 6 per cent. of the full-load pressure. The starting motor takes practically the full transformer pressure, and as with a properly designed rotor this current of 80 per cent. can produce a torque far in excess of the starting friction, it will, without any barring, start and bring the rotary up to speed very quickly. A current of this value is, as experience has shown, not sufficient to destroy the residual magnetism of the rotary, which represents nearly 1 to 2 per cent. of the field ampere-turns. The field circuit of the rotary remains connected across the D.C. brushes, and the rheostat is preferably put into such a position as to reduce the inserted resistance slightly below the value required for normal no-load excitation, as is done with ordinary D.C. shunt-wound

## SMALL INDUCTION MOTORS FOR ALL CLASSES OF WORKSHOP DRIVING.

and NEWCASTLE.

machines to allow quick excitation. As soon as it approaches synchronism, the machine will therefore readily excite itself like any other D.C. machine. This gives on the slip-rings an alternating current of a frequency which at first is slightly different from the transformer frequency. Assuming that the rotary has excited itself to full pressure, then immediately before slipping into synchronism the pressure on the starting

FIG. 2.—DIAGRAM OF CONNECTIONS OF SELF-SYNCHRONISING HIGH-PRESSURE THREE-PHASE MOTOR, WITH STARTING MOTOR.

motor will vary from zero to double slip-ring pressure. Immediately the rotary has slipped into synchronism the voltmeter will be steady; the pressure can then be adjusted and the S.P. main switch short-circuiting the starting motor can be closed. This causes neither a heavy current rush nor sparking at the commutator. No reversal of field polarity takes place. The usual time for starting and synchronising is 30 to 50 seconds. Momentary pressure surges and current rushes occur in the end turns of the windings of the synchronous motor when the full pressure is switched on, but by the arrangement shown in Fig. 2 these can be taken up by the transformer windings.

If a rotary is fitted with an A.C. booster, it is possible to provide the booster with a separate starting winding of many turns of comparatively thin wire, and, leading these to separate slip-rings or terminals, use the booster like a squirrel-cage starting motor with the same number of poles as the rotary. This method can be used in special cases.

By adjusting the excitation of the synchronous machine

the losses and work done may be divided between it and the starting motor in almost any proportion. This is clearly shown in Fig. 3, which gives the test results of a six-phase

FIG. 3.—VARIATION OF CURRENT, PRESSURE DISTRIBUTION, AND INPUT, WITH CHANGE OF ROTARY EXCITATION. LINE PRESSURE CONSTANT AT 320 VOLTS.

1,000-kw. 12-pole 500-volt rotary coupled to a 10-pole starting motor.

### DISCUSSION IN LONDON.

Mr. R. ORSETTICH (Chief Engineer, G.E.C. Witton Works) thought that the reason why rotary condensers had been so largely used for improving the power factor of a system was because they could then be run at very high speeds and the starting was easy. He was surprised that only two out of the five usual methods of starting had been mentioned. The A.C. method was used extensively in America, and no trouble was experienced. Brush raising presented no difficulty. He would like to ask the Author what would happen in his system if the starting motor got out of order, as there was no synchronising gear on the A.C. side, and if it had to be installed the simplicity claimed for the system would vanish. If in a six-phase rotary the neutral point was earthed, it would be necessary to provide a switch so that it could be disconnected during starting.

Mr. A. H. SEABROOK (Engineer and Manager, Marylebone Electricity Supply) said that the British Westinghouse Co. should be congratulated on the publicity they gave to new methods. It was his opinion that all substations should be operated by the cheapest-class of labour possible, and the new method set out in the Paper provided for this. He had just ordered four of these sets, of 1,000 kw. capacity, with power-factor correctors.

Professor MILES WALKER (Manchester Municipal School of Technology) pointed out that none of the ordinary methods of starting were satisfactory under all conditions. With a separate starting motor it was difficult to get started after a shut-down, while the A.C. method, using a low pressure on the slip rings, was not satisfactory for ordinary working, owing to the large current taken. He took great exception to the way some vector diagrams and symbols had been used in the Paper, complaining that the Author, in common with many others, did not explain his diagrams sufficiently, or even draw them correctly.

Mr. F. P. WHITTAKER (B.T.H. Design Department, Rugby) then read a long contribution, from which it appeared that certain investigations of his in general corroborated those of the Author with regard to the behaviour of rotaries during starting. Referring to the curves shown in Fig. 3, he pointed out that coincidence of phase and equality of voltage could not be obtained with the same field.

Mr. H. W. BOSWORTH (Lancashire Dynamo and Motor Co., Ltd.) was directly opposed to the Author as to the best type of winding for synchronous motors. He preferred the cylindrical rotor with distributed winding, which could run at very high speeds. His experience was that a single-phase winding was sufficient in almost all cases, and the additional expense of a three-phase rotor was not warranted. In the ordinary way of A.C. starting, if the machine, as is general, is to run at about 0.8 leading power factor, the air gap may be decreased sufficiently to allow starting without an auto-transformer. He did not think that, by using standard machines as Dr. Rosenberg did, it was possible to obtain the best results.

Dr. S. P. SMITH (City and Guilds Engineering College) thought the first part of the Paper the more valuable. Surging would still be obtained with the new method of starting, and the only way to avoid this was to synchronise properly. He had found that by closing the field switch very slowly when a rotary was up to speed the right polarity was always obtained.

Mr. W. E. BURNAND (Sheffield) wished to know if, by using the two windings, a large rotary could be started up as a repulsion motor. He described a spring clutch arrangement which acts as a mechanical damper.

Dr. E. ROSENBERG replied to some of the points raised.

### DISCUSSION IN BIRMINGHAM.

Mr. FORREST (Birmingham Corporation) considered that the phase advancer was more suitable for improving the power

factor of a system than was the synchronous motor. The trouble due to shock on the end coils of induction machines at starting did not occur with synchronous machines. He considered that the H.P. star-delta switch was an inherent weakness. In plant with which he had to deal all rotary converters could be started either by an induction motor or from the D.C. side by inserting a temporary resistance across one of the S.P. switches. He considered that the extra complications of the author's system were scarcely warranted by the advantages obtained, and if the motor failed the set could not be started.

Dr. M. L. KAHN (G.E.C., Witton Works) thought that, as the starting motor had a certain pressure at, say, 50 cycles impressed on it, while the frequency of the pressure induced in the synchronous motor had a different value, trouble would result. Further, wide variations in the pressure available at the starting motor terminals occurred, and the action of the latter would be thus much affected.

Mr. F. J. MOFFETT (Moffett & Rosher) said that a short time ago he had seen one of the self-starting, self-synchronising rotary converters in operation, and was struck by the simplicity obtained owing to the absence of starting motor, synchronising apparatus and exciter. The machine started up with 40 per cent. of the A.C. supply voltage, and the sparking during the starting period was reasonable. Twice the polarity built up wrongly, but at the third attempt came up correctly.

Dr. W. E. SUMPNER (Municipal Technical School, Birmingham) suggested combining the starting motor with the rotary so as to start up by means of induced eddy currents; in fact, synchronous machines had been known to start up and run their engines by being connected on to the mains in error.

Mr. W. E. MILNS (Supply Department, Birmingham Corporation) also spoke, and the Chairman, Mr. A. M. Taylor, added some remarks.

Dr. ROSENBERG, in reply, said that on the whole his system involved the use of rather less gear than those with ordinary synchronising apparatus. Operators' mistakes were likely to cause trouble with any system, and we must depend, to some extent, on automatic protective devices. It would not be a difficult matter for the station engineer to include a synchroscope and thus provide a second method of starting. In answer to Dr. Kahn, a large variation in the pressure on the starting motor was immaterial when the synchronous machine was near synchronism, since its power of pulling in was vastly in excess of the power developed by the small motor. In reply to a question by Mr. Bentham, he said that he advocated the use of the half pressure transformer tapping for machines up to 500 kw. on 25 cycles and 300 kw. on 50 cycles, the frequency being an important factor, since sparking was proportional to the ratio of brush thickness to arm pitch and the latter varied with the frequency.

#### DISCUSSION AT MANCHESTER.

Prof. MILES WALKER said that at the present time quite 60 per cent. of the D.C. converted from A.C. passed through rotaries, and he thought it would shortly be increased to at least 90 per cent. The importance of Dr. Rosenberg's development was the greater since the use of D.C. was rapidly increasing, while A.C. generation was the recognised thing.

Mr. A. E. MCKENZIE (Electricity Department, Manchester Corporation) spoke as to the practical success of the new methods outlined. He had seen large rotaries started and ready for switching on the 'bus-bars in 30 seconds, while in the ordinary way at least 5 to 15 minutes would be required.

Mr. K. M. FAYE-HANSEN (British Westinghouse Co.) pointed out the considerable increase in K.V.A. required to improve the power factor of a machine when nearly at unity. For instance, to improve a synchronous motor from 0.97 to unity required as many K.V.A. as to improve an induction motor from 0.7 to 0.8.

Mr. J. S. PECK (British Westinghouse Co.) thought that all new machines should be submitted to a council of engineers before being put on the market. As there was no such impartial body, he hoped that the new method described would be considered by station engineers to see if it was sufficiently an advance to justify its adoption generally. All the initial difficulties had been overcome, and the system was now, he thought, perfect.

Mr. E. M. HOLLINGWORTH thought the greatest field for the machines described was in the private sub-stations of works, &c.

Messrs. G. D. SEATON, R. G. CUNLIFFE, and WM. CRAMP also spoke.

Dr. E. ROSENBERG (in reply) said he considered that above 2,000-kw. A.C. turbo-generators and rotaries were more economical than D.C. turbos, but for small sizes the D.C. turbo was good. Dealing with the cost of the apparatus described, a 50-h.p. motor with apparatus cost approximately 50 per cent. more than the ordinary motors, but for motors of 300 h.p. and over there was practically no increase in cost.

**Batti-Wallahs' Society.**—At the last smoking concert of the season on Friday last there was an excellent muster. The oldest Batti-Wallah, in the person of Mr. Berry, late of Berry, Harrison & Co., now of California, was present, and at the request of the Chairman gave two songs.

## ELECTRICAL REGULATIONS FOR FACTORIES AN IMPORTANT DECISION

AN appeal to the Middlesex Quarter Sessions by the North Metropolitan Electric Power Supply Co. against a conviction for alleged infringement of the Home Office Regulations for the Use of Electricity in Factories, has been successful. Consequent upon a fatal accident in a sub-station, the Home Office prosecuted the company and obtained a verdict against them in the Highgate Police Court last June (*ELECTRICAL ENGINEERING*, Vol. VIII., p. 386, July 4th, 1912). A youth named A. R. Shapcott, about 18 years of age, had been killed by a 10,000 volt electric shock from a current transformer coupling while cleaning a Brazil excess pressure discharger in the North Finchley sub-station. The switchboard (a scale model of which was exhibited in court) can be made dead in sections, and one section is separated by a passage-way 2 ft. 6 in. wide from the next. The company's practice is not to box in all apparatus, but to teach the employees that "every main is alive unless known to be dead." Shapcott could have done the cleaning work in question without leaving the dead section, but must have crossed over deliberately, either by getting down from where he was, crossing over the 2 ft. 6 in. space, and getting up the other side, or else by crouching down to a height of 3 ft. 2 in. and stepping across. His arm then came in contact with a coupling insulated with Empire tape on a current transformer. This could have been made dead by opening a feeder isolating switch had it been considered necessary or expedient to do so.

Mr. J. Hunter-Gray represented the Home Office and Mr. Bodkin the company. Evidence was given for the Home Office by Mr. T. G. Styles (charge attendant to the company) and by Mr. G. Scott Ram (H.M. Electrical Inspector of Factories), while witnesses for the company included Mr. P. M. Hunt (one of the company's charge engineers), Mr. A. H. Pott (Chief Engineer, Metropolitan Electric Tramways), and Mr. E. T. Ruthven-Murray (Engineer-in-Chief to the Supply Co.). Mr. C. P. Sparks was present to give evidence on behalf of the company also, but was not called. The questions at issue arose only on Nos. 18 and 28 of the Electricity Regulations, which read as follows:—

(18) In every switchboard for high-pressure or extra high-pressure:— (d) When work has to be done on any switchboard, then, unless the switchboard be otherwise so arranged as to secure that the work may be carried out without danger, either (i) the switchboard shall be made dead, or (ii) if the said switchboard be so arranged that the conductors thereof can be made dead in sections, and so separated by permanent or removable divisions or screens from all adjoining sections of which the conductors are live, that work on any section may be carried out without danger, that section on which work has to be done shall be made dead.

(28) No person except an authorised person or a competent person acting under his immediate supervision shall undertake any work where technical knowledge or experience is required in order adequately to avoid danger; and no person shall work alone in any case in which the Secretary of State directs that he shall not. No person except an authorised person, or a competent person over 21 years of age acting under his immediate supervision, shall undertake any repair, alteration, extension, cleaning, or such work where technical knowledge or experience is required in order to avoid danger, and no one shall do such work unaccompanied.

The definition of an authorised person is:—

"Authorised person" means (a) the occupier, or (b) a contractor for the time being under contract with the occupier, or (c) a person employed, appointed, or selected by the occupier, or by a contractor as aforesaid, to carry out certain duties incidental to the generation, transformation, distribution, or use of electrical energy, such occupier, contractor, or person being a person who is competent for the purposes of the regulation in which the term is used.

The Company had been fined £25 for breach of Regulation 18, and £2 for breach of No. 28.

The Home Office contended that the whole switchboard should have been made dead under Regulation 18 (d), by means of the isolating switch; but the company contended that the alternative (ii.) applied as the passage-way was a "division." As regards Regulation 28, the Home Office contended that Shapcott was not an "authorised person," and that, as he was only about 18, he was not "a competent person over 21 years of age," so that they said the work should not have been entrusted to him. It appears that he had three terms of technical training at the Tottenham Polytechnic, and that he had worked in the company's sub-stations at Hendon and Edmonton for about ten months. He was considered by the company's officials as quite

competent for his job, and was designated by Mr. Styles, under whom he worked, as "very cute" and "keen on his work." It was contended by the company that it was quite an everyday practice to employ properly trained youths for work such as this and that he was quite competent to do it; there was, they submitted, nothing in the Regulations to prevent one authorised person working under another, and in fact every assistant in a sub-station who had been instructed in his duties was an "authorised person." If the Regulation was interpreted in the sense the Home Office claimed, it would be impossible to train the rising generation in the work.

After the hearing of evidence and addresses by counsel, the Bench deliberated for a few minutes, and the Chairman (Mr. Montague Sharpe) announced that they were unanimous in allowing the appeal as regards Regulation 28, as they considered Shapcott an "authorised person." They considered, however, that there had been an infringement of Regulation 18, but reduced the fine in this case to £10 10s.

### WORKS DRIVING

A PAPER entitled "Economies in the Use of Electric Power," by Mr. W. E. Milns, was recently read before the Birmingham Local Section of the Institution of Electrical Engineers. The author emphasised the necessity for technical knowledge for electric power canvassers, and pointed out that reduced cost of power was by no means the most powerful argument in favour of changing over to electric drive. Often the reduced cost of labour and increase of output formed the greater economy. He gave a warning that the most efficient mechanical arrangements should not be installed regardless of cost. It was sometimes cheaper in the end to consume a little more current and save capital outlay than to introduce expensive mechanical alterations. Each case must be decided on its own merits. Many comparisons of estimated costs of steam or gas and electric driving were quite incorrect, as they failed to take into account the variable nature of the load. Some examples of the magnitude of the load taken in various trades were given and an interesting series of actual results of savings by conversion to electric drive. Thus, in a 1,387-h.p. installation when driven by steam, conversion to electric driving reduced the annual power cost from £6,000 to £4,000, and for two other cases of 200 and 80 h.p. the reductions were from £1,680 to £1,476, and from £750 to £504 respectively. Similarly in a 25-h.p. town gas-driven plant the cost was reduced from £130 to £104, and in a 40-h.p. suction gas plant from £156 to £144. There are various other considerations that should be pointed out to the manufacturer who is asked to consider electric driving, such as the superior constancy of speed obtainable (in connection with which it should be pointed out that the steam engine falls to its lowest speed just at the money-earning period), the saving of floor space and the incidental convenience of electricity for small portable apparatus. Again, the conditions of labour and employment in electrically-equipped factories are usually far superior to those found in works utilising any other form of power.

In the discussion, Mr. Fennell said he thought a point of great importance in prospecting for customers was to offer a free trial wherever possible, even if only on a small scale. Mr. N. B. Rosher mentioned a method adopted by a certain firm for checking the power costs by taking them as a ratio of the total sales; thus in 1907, when the works were gas-engine driven, the ratio was 0.83, but in 1910, with electric motors, the ratio was 0.74, showing a saving due to electricity of approximately 12 per cent. A very striking instance of saving in a steam-driven rolling mill recently electrified was that the whole of the new plan will have paid for itself in two years. Mr. Foster (Siemens Bros. Dynamo Works) believed that, with the exception of flour milling, all trades in Birmingham were adaptable to the electric drive. The author, in the course of his reply, said, in reference to Mr. Fennell's remarks, that a trial was often not practicable, for the reason that a gas-engine bed-plate was frequently not the place to put an electric motor to secure an efficient drive.

**Investigation of the Cause of an Explosion.**—A curious explosion which occurred at Hebburn-on-Tyne on March 30th, causing the death of two persons, was inquired into at an inquest which was resumed in the presence of several gas and electrical experts last week. It appears that smoke was seen coming through the skirting board of the room in question shortly before the explosion, and a smell similar to that of burning insulation was reported, as well as a smell of gas. A failure of the electric lighting in adjoining premises also occurred just before the explosion. The inquest was further adjourned till to-day for examination of the cables and gas mains to be made.

### INTERPOLES

A PAPER on "Interpoles, Their Design and Use," was read by Mr. R. G. Allen, at the Dublin Local Section of the Institution of Electrical Engineers, on April 11th. The author stated that the use of interpoles had made the use of high speed D.C. machines possible, and there was a growing tendency on the part of some manufacturers to employ interpoles on low-speed generators and motors also. The chief functions of interpoles were: (1) to neutralise armature reactions upon the field, and (2) to effect straight-line commutation, i.e., to neutralise the inductive effect of that portion of the armature winding which was short-circuited at the moment of commutation.

In order to effect (1), the ampere-turns on the interpoles must be sufficient to counterbalance the distortion of the field due to the armature current. In a non-interpole machine extra ampere-turns had to be allowed to compensate for the demagnetisation and distortion due to armature reaction.

As a consequence, on interpole machines a smaller root-density could be used, thereby effecting an economy of ampere-turns in the main field. Also, and chiefly, a considerably smaller air-gap was possible. The practical effect was a saving of 35 per cent. of ampere-turns, against which, however, must be set the cost of the copper on the interpoles.

Summarising the advantages of interpoles, Mr. Allen claimed that a wave-winding could be used for almost any output; the number of turns per commutator-segment could be increased, and thus the number of segments required could be reduced; forced ventilation could be used, and thus greater densities of flux and current might be employed, and the efficiency curve at light loads was improved. On the other hand, the disadvantages arising from the use of interpoles were that the natural ventilation was impeded owing to the blocking of the spaces between the field magnets by the insertion of the auxiliary poles; and also, it had been observed that interpole machines did not always work well in parallel with those without interpoles.

Owing to the lateness of the hour the discussion was postponed to the next ordinary meeting.

### THE ELECTRICAL TRADES' BENEVOLENT INSTITUTION

THE Annual Festival Dinner of the Electrical Trades' Benevolent Institution was held at the Trocadero Restaurant on Wednesday last week. In proposing the toast of the evening, the Chairman, Mr. George Sutton, said that the funds of the Institution only amounted to about £4,000, which was not worthy of a great industry in a country famous for its energy in philanthropic channels. In his appeal for funds he was ably supported by an eloquent speech by Mr. A. Bruce Anderson, and £854 6s. was collected (about double the amount of last year). Mr. E. Byng then offered a donation of £100 if nine others would subscribe a similar amount within three months. Mr. Sutton and Mr. Hugo Hirst each promised to subscribe £100 on these conditions, and it is to be hoped that the seven more similar donations will be made.

Contributions to the funds are urgently needed to enable the Benevolent Institution to carry out the charitable purposes for which it is formed, namely, to relieve cases of poverty and distress among those connected with the electrical industry. The £854 collected at the dinner being, as it is, double the amount collected last year, shows some advance, but far, far more than this is needed. The enormous development of the electrical industry in this country must necessarily bring in its train cases which should appeal to the benevolence of those more fortunately situated. Every one of the workers in the electrical field should contribute according to his means, or according to the degree of success he has himself attained, to a fund destined to give a helping hand to those who have been less prosperous. Small contributions are welcome, as well as large ones, and should be sent to the Secretary, Mr. F. B. O. Hawes, 18 Park Mansions, Vauxhall Park, South Lambeth Road, London, S.W.

**The Northampton Institute Magazine.**—The April number of the magazine conducted by the Day Students' Union of the Northampton Polytechnic Institute contains, among other items, some notes on the theory and practice of illumination, by Mr. J. G. Gerritz; the continuation of an article by Mr. F. M. Denton on the Homopolar Generator; and an article by Mr. N. E. Paine on the motor converter.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelopes.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,336.

Please give the best method of semi-indirect lighting of offices arranged as follows:—Room, 63 ft. by 23 ft. by 14 ft. high; six double desks across the room, each at present with six 32-c.p. tantalum lamps; height of lights over desks are 2 ft. Desk centres, 3 ft. 9 in.; height, 3 ft. 6 in.; lengths, 19 ft.; passage down one side, 4 ft.; ceiling whitewashed; end walls dark green; large windows at each side of room. There are no obstructions such as pillars. Compare cost of installing and current consumption with B.O.T. unit at 1d.—"MAN."

(Replies must be received not later than first post May 1st.)

### ANSWERS TO No. 1,334.

I should be glad if any of your readers would give their experiences of the various kinds of "burglar alarms"—not necessarily confined to the ultimate test—as suited to an occupied house, i.e., where communication with a police station or boy messengers' office is not important. I am aware of the system of "treads" in the floor, working bells and lights by clock-work, which has been satisfactorily tried, but desire to know of any other efficient methods.—"B."

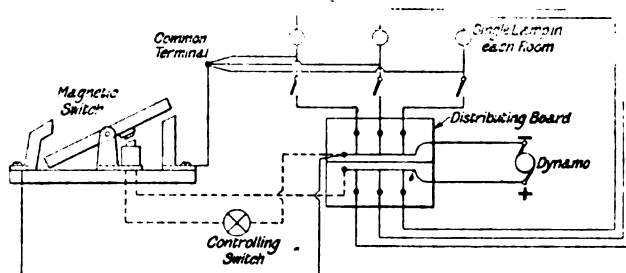

The first award (10s.) is made to C. O. PEAKE for the following reply:—

With reference to the above, I should like to say that a system of burglar alarms with which I have had to do has given every satisfaction for a number of years, and has the advantage of being comparatively cheap to instal and, further, to require almost nothing in the way of expense or attention for upkeep. All doors on ground level have let into the woodwork near the (upper) hinge a brass plate, from which a small brass knob protrudes, this being forced back flush with the plate, when the door is closed, by means of a disc (similar to a brass carpet-tack) attached to the edge of the door itself. Each window, also, in a position which might attract the prospective burglar has a similar fitting let into the woodwork. Each of these fittings is, of course, merely a S.P. switch, contact being made when the brass ball comes out beyond the level of the plate. All these switches are wired up in parallel with each other in the usual way, and in circuit with three or four large Leclanché cells and a fair-sized electric trembler bell possessing a special feature, to wit, when once the switch circuit has been completed and the bell thus set working, a string must be pulled in order to stop the latter, in addition to opening the bell switch. As practically arranged in, say, a large private house, for example, the bell would be on one of the upper bedroom floors and, near by, a small switch would be placed, thus enabling doors and windows being open during the daytime. The switch would then be closed by the last person retiring to bed at night-time.

The second award (5s.) is made to "ALARM," who writes as follows:—

In reply to this question, the writer has installed several arrangements of burglar alarms, specially adapted and installed

in country mansions. As "B" points out, he is aware of the system of treads and working of bells, &c. The following arrangement (see diagram), however, may be of use to him, and is one which is not, I think, usually installed. Furthermore, it will be quite easy to see that it could be adapted to automatically communicate with the local police station, gardener's cottage, &c., at the same time illuminating the mansion and immediate surroundings. From the diagram it will be noticed that one lamp is arranged to be switched on in each room immediately occasion arises. The control or controlling switch could be arranged to automatically work on the opening of a door, or may be placed in convenient

position, usually in the proprietor's and butler's bedrooms, landings, &c., and controlled by hand. The control switch operates a magnetic switch, which in turn closes the necessary circuits. It will further be seen that by this arrangement the single lamps in each room may also be operated in conjunction with the other lamps without interfering with the special circuit. The magnetic switch could be designed to break the circuit automatically after use. Bells can be rung at the same time, thus calling attention that the alarm switch had been closed.

With regard to the question of treads; this system the writer has found unsatisfactory, as at times the springs become weak, and very often refuse to act efficiently.

**Condensing Plant at Leeds.**—A repeat order for a large surface condensing plant for the Leeds Corporation Electricity Works, capable of dealing with 130,000 lb. of steam per hour, has been received by the Mirreles, Watson Co., Ltd. (Scotland Street, Glasgow). The plant will be connected to a turbo-alternator, for which Messrs. Willans & Robinson have just received the order. The condenser of this installation is generally similar to the one described in *ELECTRICAL ENGINEERING*, June 13th, 1912, page 317, and was specially designed to suit the conditions of dirty water from the River Aire, which contains a large amount of woollen material, which, along with mud, soon clogs up the ordinary type of condenser. All the tubes can be cleaned out whilst the plant is in operation, and the flow of the cooling water can be reversed without interfering with the running of the plant. The condenser is of the vertical pattern, having 24,800 sq. ft. cooling surface. The total height of the condenser is 28 ft., and it weighs 85 tons.

**I.E.E. Qualifying Examinations for Admission as Student.**—The Institution of Electrical Engineers does not hold a qualifying examination for admission as student, but on and after June 1st all candidates for election to the class of students will be required to have passed one of the examinations contained in the following list, which has just been circulated:—(1) The Matriculation Examination of any University in the British Empire; or the Responsions Examination of the University of Oxford; or the Previous Examination of the University of Cambridge. (2) The Studentship Examination of the Institution of Civil Engineers. (3) The School-leaving Examination for the Scottish Education Department. (4) The Naval Cadet Passing-out Examination. (5) The Entrance Examinations for Woolwich and Sandhurst. (6) The School Examination (for School-leaving Certificate) or the Senior School Examination of the University of London. (7) The Oxford or Cambridge Local Examination. (A Senior Certificate, provided it covers English and Elementary Mathematics.) (8) The Oxford and Cambridge Higher Certificate (provided it covers English and Elementary Mathematics.) (9) The Abiturienten Examination of any German or Austrian Secondary School, or the corresponding examination of similar schools in other countries. (10) The Certificate of any other Educational Authority which may be recognised by the Council of the Institution as equivalent for the purpose of admission to the class of Students.

## THE "BRIGHTON" SYSTEM OF STREET LIGHTING

MESSRS. SIEMENS BROS. DYNAMO WORKS, LTD. (Tyssen Street, Dalston) have sent us some particulars of their series system for street lighting, in which low-voltage high candle-power tungsten lamps in suitable fittings are directly substituted for arc lamps. In Brighton, where the system is employed, 46-volt 400 candle-power "Wotan" lamps, taking about 8 amperes, are replacing the former 8-ampere arc lamps, connected five in series on the 230-volt mains. The existing substitutional resistances and automatic cut-outs for cutting in the resistance when a lamp fails are being utilised, we understand, without alteration. For longer series of lamps, simple short-circuiting cut-outs are employed, which are contained in the lampholder itself; these simply short-circuit the terminals of any lamp which burns out, as the increased voltage divided over a large number of lamps is not serious. In the simplest form, the short-circuiting device consists of a film of colodion between two plates of easily fusible metal. This is a non-conductor at 50 to 100 volts, but when the lamp burns out the whole pressure of the series occurs between the two plates and sparks through, short-circuiting them. Another device, which is already in use, is a small electromagnetic short-circuiting switch, also placed in the lampholder; its coil is in shunt with the lamp terminals, but the ordinary lamp voltage is not sufficient to actuate it. As soon as the voltage rises, owing to the lamp burning out, the coil acts and short-circuits the lamp.

Messrs. Siemens inform us that the services of their special staff are at the disposal of any members of the trade to co-operate with them in connection with any scheme they may have on hand.

## THE CARLEON TRAIN LIGHTING EQUIPMENT

TESTS on the Carleon system of train or automobile lighting, described in ELECTRICAL ENGINEERING last week, page 219, have given the results shown in the curve here reproduced. The pressure variation, it will be seen, is about 12 per cent. up and 4 per cent. down in the present state of development of the system, which will doubtless be

improved on. By an unaccountable error our description of this machine last week read: "The armature winding is supported on an iron tube fixed to one end of the field magnet casting. . . ." This is obviously impossible, and the sentence should read: "Is fixed to one end of a bronze casting keyed to the shaft."

## CATALOGUES, PAMPHLETS, &c., RECEIVED

**VACUUM CLEANERS.**—A leaflet from the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), describes the several types of vacuum cleaner. The smallest is the "Little Briton" pattern, which is fitted with two pairs of bellows actuated by a 1/10th-h.p. motor enclosed in a polished oak case. The weight of this is 45 lb. More powerful bellows models are "Rapid," with three bellows, and the "Express," with six. For stationary plants of greater capacity there is also the "Turbine" equipment, with a vertical multistage centrifugal suction fans driven by a 3-h.p. motor mounted on the top. Another machine dealt with is the well-known "Magic" cleaner, in which the motor, fan and dust receiver are all mounted on one handle. A very complete series of accessories is included for all these machines.

**LIFTS.**—A pamphlet from Scholey & Co., Ltd. (151 Queen Victoria Street, E.C.), points out the much smaller cost of working electric lifts than hydraulic lifts.

**ELECTRICITY IN THE CEMENT INDUSTRY.**—A fine illustrated pamphlet (in German) from the Allgemeine Elektrizitäts Gesellschaft deals very fully with the applications of electric power in the cement industry.

**Crystal Palace School of Practical Engineering.**—The 121st awards of certificates was made by the Earl of Plymouth last Thursday, and opportunity was afforded for visitors to inspect the school.

## SEALING WAX HEATERS

TWO new types of electric sealing wax heaters have just been put on the market by Simplex Conduits, Ltd. (116 Charing Cross Road, W.C.). The use of such appliances has great advantages over flame-heated apparatus from a fire risk point of view. In the type of heater shown in Fig. 1, which is for use in factories where a large amount of packing and paper parcelling is done, such as in the tobacco trade, the sealing wax is placed in the inner receptacle, and is allowed to run over the two slopes at either end, which are also heated to prevent the wax from cooling down, and

FIG. 1.—"PLEXSIM" SEALING WAX HEATER.

can be picked up by the flaps of the parcels to be sealed. Where it is required to make use of an ordinary seal impress, the wax can be allowed to run down the slopes, which are specially shaped at the bottom to allow the wax to drop off. The amount flowing out of the central chamber can be accurately regulated by opening or closing the two apertures with the small shutters provided. Any excess wax is caught in the tray upon which the heater stands and used again, thereby guarding against waste. The appliance is substantially constructed in black enamelled iron, and, being double ended, allows two persons to work with it at the same time.

The heater shown in Fig. 2 is intended for chemists, and other trades where a large quantity of small packages require sealing. It is suitable for fixing to the wall, and for use with the ordinary sealing wax supplied in sticks. The latter is pressed on to the heated cast-iron point, which is so shaped as to allow the melted wax to fall off the point

FIG. 2.—WALL PATTERN SEALING WAX HEATER.

in the form of small drops suitable for receiving the impress. The heated portions are insulated and ventilated from the base, which always remains cool. The heater is ready for use in three or four minutes from switching on. The consumption is so low, however, that it may be kept continuously on circuit. The heated point is of cast-iron, as is also the base; the barrel containing the heating element is nickel-plated, and the whole is mounted on an ebonised wood block.

**Electric Ambulances.**—At an inquest at Southwark on the death of a man who was found unconscious in the street, the Coroner (Dr. Waldo) referred to the advantage of the City system of electric ambulances, one of which had been called in this case. He said that the case furnished strong proof of the necessity of having electric ambulances all over the metropolis. This view was unanimously endorsed by the jury in a rider to their verdict.

## ANNUAL PATENTS' REPORT

THE annual report of the Comptroller-General of Patents for the year 1912 states that the motor-car and allied industries are responsible for the most prominent group of inventions, over 1,200 inventions relating to internal-combustion engines being received. A considerable increase occurred in the construction of small dynamos for lighting motor-cars. The loss of the *Titanic* was responsible for many patents for arrangements to enable a wireless distress signal to be received, even though the operator is off duty. Now that the first automatic telephone exchange for public use in this country has been opened, much inventive ingenuity is being devoted to the subject, more particularly to the difficult problems of junction and trunk line working, and to semi-automatic and other methods for facilitating the gradual introduction of automatic systems. Compared with the year 1911, the number of applications accompanied by provisional specifications rose from 19,524 to 19,825, an increase of 1.5 per cent., and those accompanied by complete specifications from 9,829 to 10,264, an increase of 4.4 per cent.—by far the highest number on record for any one year. The total number of applications rose from 29,353 to 30,089, an increase of 2.5 per cent. The total number of complete specifications received was 18,853, compared with 18,662, an increase of 1 per cent. The number of applications filed has remained fairly constant during the last ten years, but the tendency to file a complete rather than a provisional specification upon application becomes more marked every year, the proportion of complete to provisional specifications filed on application being now nearly 52 per cent., as compared with 48 per cent. in 1907, and 30 per cent. in 1903. The total number of specifications (provisional and complete) received was 38,678, as compared with 38,186, an increase of 492, or 1.3 per cent.

The largest number of applications made on any one day was 159—on April 4th, and the smallest 48—on August 17th. It appears that 1,188 of the complete specifications filed upon applications made in the year 1911 were reported as wholly anticipated, 10,193 as partly anticipated, and 5,294 as not anticipated. Of those anticipated, 10,295 were amended without a hearing taking place, and 677 after a hearing and decision. In 302 cases a reference to a previous specification was inserted. There was an increase in the number of applications received in 1912, as compared with 1911, from all parts of the United Kingdom except the Isle of Man, and also a small increase in those received from Canada, India and the West Indies. On the other hand, there was a considerable decrease in the numbers received from the Australian Commonwealth, New Zealand and the South African Union. There was an increase in the number received from China, Japan, the United States, and some other countries, and a decrease in those from Belgium, France, Germany, Hungary, Russia and Sweden.

There were 42 applications for restoration of patents lapsed due to the non-payment of renewal fees. 27 patents were restored, two applications were withdrawn, and the remaining 13 are pending. There were five patents revoked during the year. No extensions of term beyond the usual maximum life of fourteen years were made, so that there are only three patents with extended lives now in force.

The names of twelve patent agents were added to the Register during the year, the total number on the Register on December 31st being 272.

**Osram Lamp Patents.**—Messrs. Ehrlich & Graetz and Messrs. Krupka & Jacoby, as announced in an advertisement on another page, have admitted the validity of Letters Patent 23,899/04, and other Letters Patent owned by the Osram Lamp Works, Ltd., and have agreed to cease importing or selling any lamps that infringe these patents.

**Silica Lamp Laboratory Outfits.**—The Westinghouse Cooper Hewitt Co., Ltd., have lately placed on the market a special laboratory outfit for investigating and applying to commercial purposes the properties of ultra-violet rays. They may be used for testing the fastness of colours and the quality of dyes. We are informed that many firms manufacturing high-grade carpets are using these quartz lamps to obtain comparative tests with a minimum of time and expense. The application to sterilisation is another interesting development which provides for a tremendous range of work. To protect the eyes and skin of the user of these lamps from their rays the lamps are screened with a sheet of commercial glass.

**Indirect Lighting at Cinematograph Theatres.**—The British Thomson-Houston Co., Ltd. (Mazda House, Upper Thames Street, E.C.), have sent us some particulars of the lighting of the Holderness Hall cinematograph theatre at Hull, which is carried out on their "Eye-rest" indirect system. The advantages of this now well-known system have often been pointed out in our columns, and only recently we referred to its adoption at a picture theatre in Liverpool. In the present case, in which there is complete harmony between the architectural and illumination schemes, the equipment consists of one 14-in. and four 30-in. fittings in the main hall, two 30-in., three 18-in., and one 14-in. fitting over the gallery, and four 24-in. fittings under the gallery. The entrance hall and lounge is lighted by four 14-in. fittings.

TELEPHONY AND TELEGRAPHY  
(INCLUDING WIRELESS)

In reply to a question asked in the House of Commons by Mr. Joynson-Hicks regarding the case of the electrical staff transferred from the National Telephone Co., on Thursday last, the Postmaster-General said that he had now secured the consent of the Treasury to the creation of a considerable number of additional established posts and to grant to those who do not secure certain privileges attendant upon "establishment" a special allowance of 1s. per week. In a printed reply to a question by Mr. Goldman, he gave last week some figures of the increase of telephone stations during the last five years. Whereas in 1907 there were 138,697 stations in London and 349,685, these figures were now 227,213 and 452,839 respectively. The rate of increase each year, however, was declining in both cases.

It is reported that at the tests of the Poulsen system between Lyngby (near Copenhagen) and Cullercoats, before the Technical Committee, in connection with the Marconi inquiry, messages were received at the rate of 100 words per minute at the request of the Committee, although 300 to 400 words per minute had been previously attained. It is stated that a regular Transatlantic service by the Poulsen system will be commenced next autumn.

Last week, before the Marconi Inquiry Committee, Sir Henry Norman repudiated the suggestions that he was in any way connected with the Poulsen Co., and the examination of Mr. Godfrey Isaacs, which had lasted four days, was concluded. Evidence of some stockbrokers was then taken, and on Monday the interest centred chiefly round the examination of Mr. H. Rose, solicitor to the Poulsen interests in England, who refuted the allegation that he started rumours to destroy the reputation of Ministers to gain his clients' ends, and described the issuing of the Poulsen prospectus, which was in no way secret, and the steps that were taken to assert the claims of the company, which he thought had not been fairly treated. His cross-examination was taken yesterday.

In reply to a question in the House of Commons asked by Captain Jessel, the Postmaster-General states that the automatic telephone exchanges installed at Munich have been inspected by the officers of the Post Office, and he hopes shortly to be in a position to proceed with a trial installation of the type of equipment in use in that city. Other types had already been tested with satisfactory results. We understand that in Munich 10,000 out of a total of 45,000 lines are worked automatically.

According to their annual report, although the installation of the plant has been considerably delayed by the war, a good deal of construction work has already been done by the Constantinople Telephone Co. Practically all the underground piping is finished, and over 26 kilometres of cable have been placed in position. The erection of poles on the outlying routes is in progress, and the three principal exchanges, Stamboul, Pera, and Kadiköy, are well advanced.

According to the *Elektrotechnische Zeitschrift*, the Hochfrequenz-Maschinen A.G. of Berlin (owning the patents of Dr. Goldschmidt for high-frequency generators for wireless telegraphy) is erecting in Eilvese, Hanover, and on Hickory Island, New Jersey, respectively, two large wireless stations for Transatlantic telegraphy. The steel towers are over 800 feet high.

At the meeting last week of the Automatic Telephone Manufacturing Co., the report and accounts were adopted, and a profit of £13,498 on the first year's working was reported. Reference was made to the order placed by the Post Office for an automatic exchange of 6,800 lines at Leeds, but work has not yet been commenced on the site. An order has also been received for an automatic exchange at Cordoba (Argentina).

Automatic telephone working is to be adopted at several suburban exchanges in Sydney and at Perth, Australia.

The cable between Duala and Fernando-Po was down on April 10th, but was repaired on the 18th.—The Oran-Tangier cable was restored to working order on 18th inst., and the Bagdad-Bassorah line failed on 19th inst., and was put through again on the 21st.—The Italian Administration notifies that the wireless service to ships by the Cataldo (Bari) station has been suspended.—The cable between Perim and Djibouti failed on the 21st inst., while on the 22nd the Compagnie Française Télégraphiques succeeded in again repairing their Paramaribo-Cayenne cable.

## "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

### Specifications Published April 17, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

28,868/11. **Protective Gear for A.-C. Distributing Systems.** B.T.-H. (*G.E.C., U.S.A.*). A pair of relays for parallel feeders, each having a working coil excited from a current transformer in the feeder, and a restraining coil. The restraining coil of one relay is excited from the protective transformer of the other feeder. The arrangement may consist of a balance contact arm, which may be mechanically biased, controlled by the two coils. The arrangement may be used in the method described in Patent No. 11,979/08. Two figures.

4,995/12. **Motor Control.** CROMPTON & Co., J. C. MACFARLANE, and H. BURGE. In a system where an auxiliary motor rotating in the same speed ratio as the main motor, and developing an opposing E.M.F. to the supply is used, a fine wire winding on the main motor is connected across a source of constant pressure, is arranged in series with the auxiliary motor, while a field winding on the auxiliary motor is in series with the main motor armature. By this means the power developed is kept constant, as the torque is varied inversely as the speed. Two figures.

7,014/12. **Control of Contactor Switches.** B.T.-H. (*G.E.C., U.S.A.*). This specification covers some improvements in the construction of contactor switches or relays, so as to obtain with more accuracy a varying current limit to suit varying conditions of service. On the relay there are series coils which hold the relay open until the current decreases to a certain point. This coil can be set to hold at a high current, so that the car will mount grades, and yet this high current will not occur on the level. The plunger of the relay coil has a dashpot, whose descent is retarded in accordance with the current in the series coil by magnetically acting on the plunger by means of the series coil in opposition to the downward pull due to gravity. Adjustability is obtained by movable cores in the series coils, and by an adjustable stop in the upper end of the relay spool, which varies the vertical play of the movable cores or plunger of the relay. Three figures.

13,375/12. **Arc Lamp Electrodes.** B.T.-H. (*G.E.C., U.S.A.*). Instead of making "non-consuming" negative electrodes of a magnetite mixture, they are made of an alloy of copper and aluminium in the proportions of about 92 to eight. It is claimed that with this alloy the arc keeps steady. One figure.

16,827/12. **Wireless Telegraphy.** W. P. THOMPSON (*Ges. für Drahtlose Teleg.*). An auxiliary discharge-starter called an "ignition" arrangement is used to bridge over the working spark gap in a low pressure quenched spark system. The "ignition" is effected by a high frequency discharge from an auxiliary circuit, the capacity of which is smaller than that of the condenser circuit. By this arrangement the "ignition" energy is reduced to a small fraction of the working energy. Five figures.

26,113/12. **Motor Controllers.** F. J. MOFFETT and N. B. ROSHER. An improved construction for switches having two or more positions, in which a contact arm is rotated step by step by a ratchet wheel, is described. A hand lever engages with a longitudinally sliding bar carrying a pawl, which engages with a ratchet wheel to rotate it one tooth at a time. The return movement of the ratchet wheel is prevented by a pawl connected to a hand-operated releasing gear for allowing the switch arm (connected to the ratchet wheel) to be returned to its "off" position by means of a spring. The return movement of the bar is controlled by a dashpot. One figure.

### Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** MARKS (*Brown, Boveri*) [Generator load equalising] 29,178/11; LEITNER [Regulating dynamos] 7,776/12; MÜLLER [Insulators] 7,972/12; CALLENDER'S CABLE CO. and PIPKIN [Armoured cables] 14,157/12.

**Dynamos, Motors, and Transformers:** VANDERVELL and MIDGLEY [Dynamos] 8,040/12; HEWITT [Vapour rectifiers] 22,246/12; SPINELLI [Static transformation of three-phase current to single-phase: frequency multiplied by three] 2,471/13.

**Electrochemistry:** HELBRONNER, VON RECKLINGHAUSEN and HENRI [Sterilisation of milk] 14,958/12.

**Ignition:** KETTERING [Engine starting] 29,085/11, 29,344/11, 29,070/12, 29,083/12, and 504/13.

**Switchgear, Fuses, and Fittings:** OLMSTED [Pressure regulators for dynamos] 8,063/12; B.T.-H. (*G.E.C., U.S.A.*) [Control systems] 11,466/12; LIDDLE (*Gordon Elec. & Mfg. Co.*) [Switches] 24,932/12; DE FRETES [Sign flasher contact gear] 3,006/13; GRUBER [Mercury switches] 4,297/13.

**Telephony and Telegraphy:** HEURTLEY [Telegraphy] 7,786/12; PEDERSEN [Relays, microphones, &c.] 7,888/12; DUBILIER [High-frequency apparatus] 8,196/12; RAYMOND-BARKER [Telegraph transmitters] 8,352/12; HUNTER and SHAND [Simultaneous transmission of telephonic, telegraphic, and signalling current over power lines] 13,355/12; SIEMENS BROS. & Co. (*Siemens & Halske*) [Automatic telephony] 18,356/12; BAUMANN [Telephony] 18,676/12; KESSELS [Printing telegraphs] 21,332/12; BRITISH L. M. ERICSSON and BROOKES [Telephone receivers] 22,252/12; SORET [Audophones] 22,613/12; ROTTGARDT [Production of high-frequency oscillations] 22,875/12; JENSEN and PRIDHAM [Telephones] 25,896/12; KRAUSE [Production of oscillations] 28,595/12; BLOCK [Disinfecting telephones] 609/13; ROUZET [Wireless for air-craft] 947/13; EGERTON [Telephone transmission circuit] 2,749/13; MAXWELL [Telephone receiver supports] 5,802/13.

**Traction:** SAMALA [Automatic tramway signalling] 10,434/12; PARKER and SMITH [Trolley heads] 15,022/12.

**Miscellaneous:** HADDAN (*Nat. Cash Register*) [Distant indicators for cash registers] 7,494/12; DICKSON and CLARK [Gate fastenings: relief and signals] 8,307/12; RIDER [Adaptable trolley] 10,383/12; SZÉK [Primary batteries] 18,404/12.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Arc Lamps:** GEB. SIEMENS & Co. [Electrodes] 7,108/13.

**Electrochemistry:** NODON [Treatment of cellulose] 6,668/13.

**Incandescent Lamps:** VOIGTLÄNDER [Process for manufacturing articles of tungsten] 6,911/13.

**Switchgear, Fuses, and Fittings:** ABBATECOLA [Current limiter] 25,542/13; YOUNG [Switches] 5,321/13.

**Telephony and Telegraphy:** SAHULKA [Wireless transmitters] 6,479/13; SIEMENS & HALSKE [Junction line—selecting switch engaged signal] 7,130/13; [Automatic telephone number impulse transmitters] 7,530/13.

### Application for Restoration of Lapsed Patent

22,819/08. **Electric Clocks.** T. J. MURDAY. The patent, which is for a means and mechanism for indicating time from the motion of an electric pendulum as described in specification No. 15,644/01, expired on October 27th, 1912, owing to the non-payment of the renewal fee. Application has now been made by E. R. T. Clarkson for restoration of this patent. Objections must be lodged before June 16th.

### Application for Extension of Term of Patent

8,961/99. **The Telegraphone.** V. POULSEN. Owing to difficulties in collecting the necessary evidence in the application for extension of term beyond the customary 14 years (ELECTRICAL ENGINEERING, Vol. VIII., p. 600, October 31st, 1912), this petition has been delayed. It has, however, been ordered that the petition be in the list for to-day. The patent will expire, unless the petition is granted, on Monday next.

### Opposition entered to Grant of Patent

**Telephony and Telegraphy:** H. LENCH [Manufacture of foot-steps for poles] 10,600/12.

### Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

**Arc Lamps:** O. SCHAEFFER [Suspension gear] 260/06.

**Distributing Systems, &c.:** J. H. HOLMES & Co. [Push-button control of rotary web printing presses] 27,242/05.

**Electrochemistry and Electrometallurgy:** A. HORTH [Induction furnace with spiral smelting channel] 28,542/07.

**Incandescent Lamps:** B.T.-H. (*G.E.C., U.S.A.*) [Connecting metal filaments to leading-in wires] 155/07.

**Switchgear, Fuses, and Fittings:** C. E. PETTIT [Pressure regulator for calcium carbide furnace] 131/06; T. J. and E. RORKE [Electromagnetically-operated switches] 12,175/08.

**Telephony and Telegraphy:** C. M. JACOBS and A. H. NICHOLSON [Selective party line signalling] 146/02; I. KITSEE [Submarine telegraph repeater] 28,690/07; G. A. CARDWELL [Page printing telegraphs] 28,736/07; A. H. NICHOLSON [Polarised relay for selective signalling] 220/08.

**Traction:** B.T.-H. (*A. H. Armstrong, U.S.A.*) [Minimising self-induction of steel rails in three-rail system by special connections through transformers from the feeders] 25,748/99; SIEMENS BROS. & Co. and L. M. G. FERRIERA [Electromagnets for operating railway points, signals, &c.] 70/03.

LONDON

## ELECTRIC TRACTION NOTES

A House of Commons Committee, presided over by Sir Ivor Herbert, has commenced consideration of a long list of Bills dealing with trolley 'buses and motor-'buses, and for the first time a principle has been laid down as regards maintenance of the roads over which these vehicles run. This, of course, in the case of municipalities only applies when the vehicles run outside the municipal boundaries, and the first decision, in the case of the Chesterfield Corporation, is one of this sort. How the Committee will deal with the proposals by companies remains to be seen. In the case of the Chesterfield Corporation half a dozen routes were scheduled, most of them running well outside the city and on to the main roads of the Derbyshire County Council, who opposed on the ground that the Corporation should pay for the necessary widenings and also towards the maintenance. So far there has been no case in which a Parliamentary Committee has put such conditions upon the promoters of a trolley omnibus or motor-'bus Bill, although in the case of Rottingdean, the Brighton, Preston and Hove Omnibus Co. agreed to pay the Sussex County Council a contribution towards road maintenance on a car-mile basis. Recently, in the case of Coventry, the Corporation withdrew certain motor-'bus proposals outside the city, owing to an indication by the Committee that it thought that something should be paid towards road maintenance. In the case of the Chesterfield scheme, it has been decided that the trolley 'buses and 'buses may not run on any road until it has been widened to 17 ft. with a 4-ft. footpath, and, as regards maintenance, there is to be an arbitration every three years to determine whether the traffic of the trolley 'buses and 'buses has caused wear on the county roads which can come within the definition of "extraordinary" traffic under the common law appertaining to highways. If it is so determined, then a money value will be placed upon such wear. The same Committee is now considering the Rhondda Railless Traction Bill.

Last week Lord Sanderson's Select Committee of the House of Lords on the Metropolitan Railway Bill decided that the Bill might proceed as regards the extension of the Great Northern and City Railway from Moorgate to Lothbury, but they did not consider that the preamble had been proved as regards the connection with the Waterloo and City Railway. The plans for linking up the Great Northern and City Railway with the Metropolitan Railway at Liverpool Street, so as to admit of through running from Finsbury Park to New Cross, have been withdrawn. It is understood that a better scheme with this object in view may be promoted next session embracing the through running of Great Northern trains. The same Committee has since considered the City and South London Railway Bill for enlarging their tunnels from 10 ft. 2 in. to the usual "tube" size of 11 ft. 8½ in., so as to admit of through running. It was proposed by the Charing Cross, Euston and Hampstead Railway to construct a line from Camden Town Station to Euston, and there to connect with the City and South London. The Committee found the preamble proved, but decided that the clauses, including one for compensation by the Great Northern Railway, should be considered later in conjunction with those of the Metropolitan Railway. The new arrangements would enable some forty trains an hour to be run, with about three times the present seating capacity. It is interesting to note in this connection that on Monday the number of trains per hour was increased from 24 to 30.

Another London electric proposal, in the Wimbledon and Sutton Railway Bill, was passed by the House of Lords Committee, presided over by Lord Sanderson, on Tuesday. The line was sanctioned a few years ago as an independent undertaking, and since then an arrangement has been made for the District Company to take it over and work it as part of the London electric railway system. The proposal now was to extend the time for the construction of the line and to increase the capital from £455,000 to £715,000. It may be mentioned that local landowners have agreed to guarantee

4½ per cent. on the capital for ten years, in order to get the line built at the earliest possible moment.

The Bill of the Hastings Tramways Company, in which they seek powers to use an overhead system along the front in place of the Dolter surface contact system has also been engaging the attention of a Select Committee of the House of Lords during the past week. There has been a large amount of opposition, including that of a number of frontagers. It is said that the majority of the residents are opposed to trams being allowed along the front at all. The overhead system, it is also said, would detract from the beauty of the front, but there are many obstructions in the way of signs, posters, &c., already there. Among the many suggestions made were the use of a conduit or some other surface contact system. It was, however, pointed out by experts that, apart from capital cost, the conduit system is undesirable owing to the front sometimes being flooded with sea-water. The Committee on Tuesday decided not to pass the Bill.

According to a report of the Finance Committee of the London County Council, the gross surplus on the working of the L.C.C. tramways for the year amounted to £934,212, after taking into account the deficiency of £11,966 on the horse traction account. After deducting all proper charges, the net surplus was £222,703, of which £138,152 was carried to renewals fund, and the balance of £84,551 to the general reserve fund. It is pointed out that the average receipts per car mile have declined from 11'95d. in 1907 to 10'98d. for the year under review. The accounts, however, show that, notwithstanding these decreases, there is an increase in each successive year in the final surplus.

The directors of the Metropolitan Electric Tramways, Ltd., recommend a dividend of 5½ per cent. for the year with £10,000 to reserve and £604 carried forward. The profits from tramway working have declined by £24,347, due to motor-'bus competition. To meet this the car services have been increased, but although the receipts have been maintained, the expenses are higher. Improvement is, however, expected now that the Company have entered into an alliance with the London General Omnibus Co. Under the scheme for the consolidation of the Company's interests with those of the London United Tramways Co., the Company has sold to the London and Suburban Co. the whole of its interest in the Tramways (M.E.T. Omnibus Co., Ltd.). The Company is promoting a Bill for a railless traction service between Tottenham and Walthamstow.

The Rochdale Tramways net profits for the year amount to £7,423, as compared with £6,486 last year. It is proposed to allocate £2,327 to rate relief—this being the first contribution the department has made for this purpose—and to carry £5,096 to renewals fund. Last year's working of the Bury tramway sections shows a profit of £9,572, and it is proposed to allocate £5,000 to relief of the rates. There is a loss of £809 on the Heywood tramways undertaking during the past year, as compared with a loss of £742 last year.

The receipts of the Swansea Improvements and Tramways Co. have increased by £1,030, and a 5 per cent. dividend is recommended.

The directors of the Oldham, Ashton and Hyde Electric Tramways Co. report a net profit for the year of £6,788, and out of an available balance of £6,968 they propose to pay a dividend on ordinary shares at the rate of 7 per cent. per annum for the six months ending December 31st (making 6 per cent. for the year), to place £1,250 to reserve, and to carry forward £218.

A Bill is now before the Canadian Legislature to authorise the purchases by the municipality of the Toronto Street Railway Company and the Toronto Electric Light Company. If the Bill is passed, the city will have a complete monopoly of the electric lighting and surface transportation.

**I.E.E. Students' Section.**—The annual general meeting has been postponed from April 30th until May 7th. A Paper will then be read by Messrs. E. A. Richards and D. Dunham, entitled "Single-Phase Commutator Motors." There are five extra-collegiate vacancies occurring on the students' committee. Nominations should be sent to the hon. secretary, Mr. E. T. Driver (24 Bradgate Road, Catford, S.E.), as early as possible.

WHEN CORRESPONDING WITH ADVERTISERS, PLEASE MENTION "ELECTRICAL ENGINEERING."

## LOCAL NOTES

**Barton:** *Electric Supply.*—The Barton-on-Humber Electric Supply Co. has been incorporated with a capital of £20,000 to take over electric lighting powers owned by Mr. F. Hopper. A contract for works and equipment has been entered into at a cost of £10,270, and the erection of the generating station has been commenced.

**Blackburn:** *New Plant.*—The extensions have been opened by the Mayoress and Mrs. Brodie, wife of the Chairman of the Electricity Committee. A demonstration of electric heating and cooking was given during the afternoon.

*New Generating Station.*—The scheme of Mr. P. P. Wheelwright, Borough Electrical Engineer, for a new £10,000 kw. generating station at Greenbank, at an estimated cost of £75,800, has been adopted by the Council.

**Coventry:** *A Local Government Board Inspector's remarks.*—During an inquiry into an application for a loan of £20,000 for the electricity undertaking last week Mr. H. R. Hooper made some strong remarks against application of profits in relief of rates while there was a mass of outstanding capital.

**Dundee:** *Annexation of Broughty Ferry and Monifieth.*—In giving evidence before an inquiry regarding the proposed annexation of these districts, Mr. H. Richardson, the City Electrical Engineer, remarked that if these districts were brought into the Dundee area of supply, the charge for lighting would be reduced from 5d. to 1'56d., and for power from 3d. to prices ranging from 1½d. to less than ½d. per unit.

**Hazel Grove:** *Provisional Order.*—The Board of Trade has made and issued a provisional order to the Hazel Grove and Bramhall Urban District Council, authorising them to supply electrical energy for all public and private purposes within the urban district.

**Lossiemouth:** *Provisional Order.*—The Board of Trade has granted a provisional order for the electric lighting scheme.

**Manchester:** *Progress of Electricity Undertaking.*—Notwithstanding the increased cost of coal and materials, an even rate of progress is more than maintained, and during the past twelve months 104,000,000 units have been consumed, as against 93,000,000 units for the previous year. The Electricity Committee, in considering the estimates a few days since, allocated £28,500 to the relief of rates.

**Richmond:** *Supply from Lots Road.*—The Standing Orders Committee of the House of Lords have consented to suspend the standing orders to allow a Bill to be introduced after the proper time to empower the Richmond Electric Light Co. and the Corporation of Richmond to take a supply in bulk from the Lots Road Station of the London Electric Railways and from the County of London Electric Supply Co. upon certain conditions. The company undertake to remove the existing chimney shaft of their present station. The period after which the Corporation of Richmond have power to purchase the undertaking is extended by thirty years, making the year 1951.

**Southampton:** *Electrical Exhibition.*—Acting on a suggestion of the Borough Electrical Engineer, a sub-committee has been formed to make arrangements for holding an electrical exhibition.

**Woodford:** *Electric Supply.*—An agreement is being drawn up for a supply of energy in Woodford by the Walthamstow Council. The price for private lighting is not to exceed 4d. per unit, whilst for domestic purposes it will be 1d. per unit.

**York:** *Reduced Lighting Tariff.*—It has been decided to reduce the flat rate for energy for lighting purposes from 4½d. to 3½d. per unit.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

## Generating Stations, Sub-Stations, Mains, &amp;c.

**Belfast:**—Circulating pump. City Electrical Engineer. May 19th. (See an advertisement on another page.)

**Bridlington:**—A Local Government Board inquiry was held last week regarding a loan of £5,000 for extensions to the electricity works.

**Canada:**—Two 5,000-kw. three-phase generators and water

turbines. Chairman, Board of Control, Winnipeg. May 15th. Specification, &c., at 78 Basinghall Street, E.C.

**Fleetwood:**—The Local Government Board has sanctioned the following loans for the electricity works: £5,240 for 17 years; £1,410 for 15 years, and £500 for 30 years.

**Glasgow:**—Tenders are invited for twelve months' supply of cables, meters, and arc lamp carbons. (See an advertisement.)

**Grimsby:**—A Local Government Board inquiry has been held into an application for a loan of £17,300 for extensions.

**Ireland:**—Board of Trade inquiries into applications for provisional orders have been made at Dromore and Banbridge.

**Lincoln:**—A Local Government Board inquiry has been held into an application for a loan of £12,500.

**London:** *L.C.C.*—Twenty-ton overhead hand-crane for Shoreditch sub-station. Clerk to Council. May 13th. (See advertisement on another page.)

**Long Eaton:**—Extensions to the electricity works are to be put in hand at a cost of £10,000.

**Norway:**—Tenders are invited for centrifugal pumps, condensing plant for two 6,000-kw. turbines, at Christiania. Provision is also made for the following expenditure for the electricity works: extensions of plant, £50,000; extensions of boiler house, £4,700; cables, £27,400. Particulars from Board of Trade, 73 Basinghall Street.

**Stockport:**—Mr. R. H. Hooper held a Local Government Board inquiry last week into an application for sanction to borrow £24,500 for the electricity undertaking.

## Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Barrow-in-Furness:**—Tenders are invited by May 7th for electric light installation at Roose. H. T. Fowler, architect, Cornwallis Street, Barrow.

**Birmingham:**—Fire station at Aston. City Engineer.

**Bradford:**—Cinematograph theatre.

**Bridgend:**—Additions to workhouse.

**Chester:**—Extensions to County Asylum at Upton.

**Glasgow:**—Zoological Garden in Rouken Glen Park.

**Hornsey:**—New secondary school.

**Knaresborough:**—School. Education architect, County Hall, Wakefield.

**London:** *Hammersmith.*—Enlargement to town hall.

*Hackney.*—Tenders are invited for installation at elementary school at Wilton Road. (See an advertisement.)

*Holloway.*—Tenders are invited for installation at special school at Elthorpe Road. (See an advertisement.)

*Marylebone.*—New Town Hall in Marylebone Road.

**Manchester:**—Freemasons' hall to cost £25,000.

Extensions to Royal Exchange.

**Middlesborough:**—Tuberculosis hospital. S. E. Burgess, Borough Engineer.

**Padiham:**—Territorial Headquarters. Surveyor, East Lancs. Association, Town Hall Chambers, Ashton-under-Lyne.

**Spennymoor:**—Public hall and Council offices. Architect, G. T. Wellburn, 115 Albert Road, Middlesborough.

**Stirling:**—New station buildings, Caledonian Railway. J. Blackburn, Secretary, Caledonian Railway, 302 Buchanan Street, Glasgow.

## TENDERS RECEIVED AND ACCEPTED

**Chiswick:**—An order has been placed with Messrs. Lassen and Hjort for water-softening plant to deal with 24,000 gallons per day.

**Edinburgh:**—The Bastian Meter Co.'s tender for 2½-ampere meters has again been accepted.

**London:** *L.C.C.*—The Fire Brigade Committee propose that the tender of "Cedes" Electric Traction, Ltd., for two electrically-driven escape vans be accepted at £1,668. The

FOR  
**STEAM JOINTS**  
USE

JOHN HUDSON & CO.'S SUCCESSORS, Mansell St., London, E.

contract for the batteries would be sub-let to the Tudor Accumulator Co.—The tender of Newton Bros., Derby (£7,987 10s.) for rewinding seventeen 300-kw. and three 500-kw. motor-generators at tramway sub-stations has been accepted. Four tenders had been received, the highest of which is nearly three times that of the accepted one.

**Swinton.**—Erection and equipment of Broad Oak Park sub-station:—Building, Messrs. W. Farnworth & Son, £48 10s.; switchgear, General Electric Co., £119; provision and laying supply mains, General Cable Manufacturing Co., £205.

Among recent contracts for Tantalum lamps for traction purposes received by Siemens Bros. Dynamo Works, are twelve months' supply for Dundee and Croydon tramways. In the latter case Wotan lamps are to be employed for the depot lighting, and another large contract for these has been placed by the Government of the Union of South Africa.

## APPOINTMENTS AND PERSONAL NOTES

The Hampstead Borough Council at its meeting last Thursday appointed Mr. William Wyld, Electrical Engineer and Tramways Manager to the Birkenhead Corporation, as Chief Electrical Engineer and Manager to the Borough of Hampstead.

The appointment of Mr. C. M. Davies, of Bristol, as consumers' engineer has been confirmed by the Council.

We regret to record the death of Mr. R. Coates, Manager of the Ystradgynlais electric light works, who was caught in a flywheel on the works and terribly mutilated.

Mr. Dacre Helme, who has been Tramways Manager and Electrical Engineer at Nelson since 1906, died last Friday in his fortieth year.

Mr. S. L. Pearce has been elected President of the Manchester Association of Students in connection with the Institution of Civil Engineers.

Mr. C. N. Hefford, who has been managing the Leeds electricity undertaking temporarily since the appointment of Mr. H. Dickinson to Liverpool, is recommended by the Tramways and Electricity Committee as permanent manager of the undertaking. The commencing salary is to be £600 per annum. Mr. Hefford has been in the Leeds electricity department since 1904 as engineering assistant.

An experienced designer of electrical machines and apparatus is required by a large shipbuilding and engineering firm. (See an advertisement.)

Jointer required for East of Scotland. (See an advertisement on another page.)

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £72 to £72 10s. (last week the same).

**Business for Sale.**—An established electrical contracting business in London is for sale. (See an advertisement.)

**Agency.**—H. W. Butler & Co. (Craven House, Kingsway, W.C.) have been appointed agents for London and district for James Macintyre & Co., Ltd., of Burslem, makers of electrical porcelain.

**Strike at Dick, Kerr's Works.**—A strike of some 245 labourers and semi-skilled workers employed at the works of Dick, Kerr & Co., Ltd., at Preston, has been settled. It appears that under a recent agreement certain advances in wages were due to some of the men on April 5th, and to others on April 12th, but owing to a departmental error the wages of the men were made up on the old scale, and the mistake was not discovered in time to remedy it until the evening of April 12th. The men do not appear to have trusted the company and to have gone on strike; however, the dispute is now settled. Under the agreement all labourers over 21 will be paid 20s. per week, and semi-skilled men receiving up to 27s. are to have an advance of 1s. from April 12th, and a further advance in October; labourers put on semi-skilled work are to get an advance of 1s. after three months, and a further 1s. after nine months, with further increases depending on proficiency.

## COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**Lancashire Electric Power Co.**—At the meeting last week, Dr. H. F. Parshall referred to the contract for the bulk supply to Salford and Hindley and to the electrified section of the Lancashire and Yorkshire Railway between Bury and Holcombe Brook. The trading profit amounted to £14,617 and would have been higher if it had not been for the coal and textile strikes. The whole debit balance had now been written off, and £3,137 carried forward. An issue of £100,000 five per cent. prior lien bonds is proposed to pay for plant extensions, which will enable increased profits to be made.

**North Metropolitan Electric Power Supply Co.**—The report states that the revenue and expenditure have both increased by about £10,000 since the previous year. Out of a total credit balance of £80,773, after providing for debenture and other interest, reserve (£2,000), depreciation (£25,000), and preference dividends, a 6 per cent. dividend on the ordinary shares and a bonus of 8s. per share is recommended, with £1,820 carried forward. A further issue of 5 per cent. mortgage debentures is to be made at an early date. The extensions at Brimsdown are nearly completed, and extensions are also in hand at Willesden. The Hertford station is shortly to be extended. Supply has been commenced at Hadley and will be extended this year to East Barnet. The meeting will be held on April 23rd.

**Babcock & Wilcox.**—The report to be submitted at the meeting on April 24th records a net profit of £426,146. The directors recommend a dividend of 3 per cent. on the preference shares, and 9 per cent. on the ordinary shares, with £150,000 placed to reserve, and a balance of £64,013 carried forward. The volume of business done during the year shows an increase over any previous period, and to cope with further business the directors recommend an issue of £200,000 5 per cent. cumulative second preference shares.

**Johnson & Phillips.**—At the meeting to be held on April 24th a report will be submitted showing a profit of £28,324. After deducting directors' fees, interest, depreciation, and other charges, a balance of £3,315 remains to be carried forward.

**Midland Electric Corporation for Power Distribution.**—The result of last year's working is a balance of £12,843, and after making provision for debenture guarantee premium, writing off expenses of issue of debentures and ordinary shares, and transferring £2,899 to depreciation, a sum of £6,250 is carried forward. An additional 3,000 kw. turbo-alternator was installed during the year.

**Brentford Electric Supply Co.**—At the meeting on April 5th it was announced that the first year's working of this company, which takes supply in bulk from the Metropolitan Electric Supply Co., had resulted in a net balance of £112, which is carried forward. £3,956 has been spent on mains, services, &c.

**Cork Electric Tramways & Lighting Co.**—This company reports receipts £1,238 in excess of those in the previous year, notwithstanding the adverse affect of the extended use of metal filament lamps. The expenses, however, have increased by £2,270, owing mainly to the increased price of coal and heavy maintenance charges for cables. A 3 per cent. dividend on the ordinary shares is recommended.

**Staff Dinner of the Metropolitan Electric Supply Co.**—The annual staff dinner of this company was held on Wednesday of last week at the Trocadero, with Mr. J. S. Highfield (Chief Engineer) in the chair. The speakers included Mr. F. W. Goodenough, Mr. D. Sinclair, Mr. Roger T. Smith, Mr. E. Cunliffe Owen, and others. The chairman paid a tribute to the loyalty of the staff, especially during the hard time which had preceded their present condition of increasing prosperity, and Mr. Roger T. Smith referred to the existence of negotiations between the company and the Great Western Railway.

**Manchester Local Section of the Institution of Electrical Engineers.**—At the annual meeting on April 8th the following officers and committee were elected for the forthcoming session: *Chairman*, Prof. E. W. Marchant (Liverpool University); *Vice-Chairman*, Dr. Rosenberg (British Westinghouse Co.) and Mr. P. P. Wheelwright (Borough Electrical Engineers, Blackburn); *Committee Members*, Prof. Miles Walker (Municipal School of Technology), Messrs. F. A. Whysall (Manchester Electricity Dept.), E. R. Hollingsworth (Borough Electrical Engineer, St. Helens), B. Welbourn (British Insulated & Helsby Cables), G. Layton (British Westinghouse Co.), K. M. Faye-Hansen (British Westinghouse Co.), A. E. McKenzie (Manchester Electricity Dept.), H. J. Hawkins (Borough Electrical Engineer, Salford), C. C. Atchison (Borough Electrical Engineer, Rochdale), C. J. Beaver, E. L. Hill (Siemens Brothers Dynamo Works), and Bertram Thomas; *Secretary*, Mr. J. Frith. An increase of 28 members of the section was reported since last year.

## SUMMARY

THE commercial aspect of phase advancing has been discussed by the Institution of Electrical Engineers in London and Birmingham, after the reading of a Paper on the subject by Dr. G. Kapp, who treated of dynamic phase advancers, and showed that a large saving would result; the amount, however, was challenged by several speakers in the discussions. Mr. W. M. Mordey and Mr. A. W. Ashton thought that the static condenser should be a very serious rival to the dynamic advancers, though it appears that the Kapp "Vibrator" is probably the cheapest apparatus of all. (Page 239.)

THERE was an interesting discussion at a recent meeting of the Western Local Section of the Institution of Electrical Engineers on the possibility of applying the Thury system to mines, which was suggested by Mr. S. F. Walker. Although some of the advantages of the system were admitted, it was generally felt that the insulation of the motors presented great difficulties under mining conditions. (Page 241.)

SOME notes on the uses of electricity in the tin-plate industry were contained in a Paper read recently by Mr. H. Spence Thomas before the South Wales Institute of Engineers. (Page 242.)

A GATE end box for mines is described on page 243.

THE Specifications published by the Patent Office during April of particular interest to mining electrical engineers and metallurgists include one for a connector for the metallic armouring of cables by A. Hepburn, two relating to electric furnaces, and one covering certain arrangements for the electrolysis of scrap-iron by G. Tischenko. (Page 244.)

THE full text of objections to the draft general regulations made by the Home Office, under the Coal Mines Act, 1911, has now been issued. An amendment to give greater freedom in the use of electric safety lamps and some objections to the telephonic regulations are included. (Page 243.)

RECEPTION tests for rotary converters are discussed in our "Questions and Answers" columns. (Page 245.)

Two new turbo-generators were officially started up last week at Blackpool. (Page 246.)

At a meeting of the "Point Fives" at Bradford, Mr. T. Roles outlined the progress of electric heating and cooking in that city. The association is issuing its own designs of posters, &c., and will hold an open meeting during the convention of the I.M.E.A. (Page 246.)

A REFLECTOR for shop-window lighting is referred to on page 246.

THE consolidation of the constituent units of the Imperial College of Science and Technology has been in progress for some time. Much new equipment of a most practical character is now installed. (Page 247.)

WE outline some electrical clauses in the Derby Corporation Bill which is now being considered by a House of Commons Committee. (Page 247.)

THE Board of Trade has asked that the clause in Bills before Parliament this session, giving them powers to authorise additional trolley omnibus routes, should be deleted.—A trolley omnibus route on the Cedes-Stoll system has been opened at Keighley.—A sum of £1,250,000 has been sanctioned for electric railway purposes in Berlin. (Page 247.)

THE petition for extension of term of the Telegraphone Patent will not be heard before May 20th. The Specifications published by the Patent Office last Thursday included one by E. Raymond-Barker for a system of working Morse over submarine cables not requiring a split battery, while another, taken out by Callender's Cable & Construction Co., covers lead sheathing wire armoured cables, so as to protect the armouring from chemical action. (Page 248.)

MR. WINSTON CHURCHILL was called before the Marconi Committee in the week, and expressed himself strongly upon the action of the Committee in calling him. Mr. A. A. Campbell Swinton has also made a statement to the Committee in connection with his report upon the Poulsen system.—The Postmaster-General's annual statement in the House of Commons last week mentioned the erection of a wireless station at Aberdeen with a view to meeting the requirements of the North of Scotland for additional telegraphic facilities. During the past year 162,000 miles of telephone wires have been laid, and 20,000 new subscribers have been connected. (Page 250.)

THE Harrogate Borough Electrical Engineer has outlined a scheme for developing electric cooking and heating, and a similar scheme has been adopted at Bexley.—An electric transporter bridge is contemplated at Glasgow.—Mr. Robert Hammond will act as arbitrator to determine the price to be paid by the Salford Corporation for traction current.—A strike of electrical wiremen has taken place at Leicester. (Page 251.)

AN £80,000 loan has been sanctioned at Aberdeen; additional generating plant is to be installed at Wolverhampton, Hamilton, Battersea, Glasgow, Warrington, Rochdale, Stalybridge, Grimsby, King's Lynn, Hoylake, Felixstowe, and Peterborough; electric cranes are required at Southampton. (Page 251.)

### ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, MAY 1st.

*Iron and Steel Institute.*

10.30 a.m. Annual Meeting at Institution of Mechanical Engineers. Among the papers down for reading is "A New Form of Electrically Driven, Two-high, Continuous Running, Reversing Mill," by Andrew Lamberton.

*Institution of Electrical Engineers.*

8 p.m. "The Use of the Electrostatic System of Measurement of Power," by C. C. Paterson, E. H. Rayner, and A. Kinnes.

SATURDAY, MAY 3RD.

*Birmingham and District Electric Club.*

7.45 p.m. At Swan Hotel, New Street. Discussions on "Purchased v. Home Generated Power" and "Direct v. Alternating Current for General Works Power."

MONDAY, MAY 5TH.

*Institution of Electrical Engineers: Newcastle Section.*

7.30 p.m. At Armstrong College. "On Phase Advancing," by Dr. G. Kapp.

*Society of Engineers.*

7.30 p.m. At Institution of Electrical Engineers. "Tidal Waters as a Source of Power," by C. A. Battiscombe.

WEDNESDAY, MAY 7TH.

*Institution of Electrical Engineers: Students' Section.*

7.45 p.m. Annual General Meeting. "Single-phase Commutator Motors," by E. A. Richards and D. Dunham. *Faraday Society.*

8 p.m. At Institution of Electrical Engineers. A number of papers will be read on aluminium and the phenomena of electrolysis.

### The London Electrical Engineers.

(TO-DAY) THURSDAY, MAY 1ST. C. Company.—Recruit Training, 7 to 8 p.m. Co. Training, 7 to 10 p.m.

FRIDAY, MAY 2ND. D. Company.—Recruit Training, 7 to 8 p.m. Co. Training, 7 to 10 p.m.

SATURDAY, MAY 3RD. All Companies.—Annual Musketry at Purfleet Rifle Ranges. Trains leave Fenchurch Street Station (Midland Railway, Tilbury Branch) at 1.15, 1.35, and 2.15 p.m. Equipment provided at the Ranges. Headquarters open from 10 a.m. till noon.

MONDAY, MAY 5TH—A. Company. TUESDAY, MAY 6TH—B. Company. THURSDAY, MAY 7TH—C. Company. FRIDAY, MAY 8TH—D. Company. Infantry Drill, 7 to 9 p.m. Technical Instruction for all Members on the Sixth Rate and for all Candidates for Higher Rating, 7 to 9 p.m. Musketry Instruction, 9 to 10 p.m.

WEDNESDAY, MAY 7TH. All Companies.—Annual Musketry at Purfleet. SATURDAY, MAY 10TH. Headquarters open from 10 a.m. till 12 noon.

**Institution of Civil Engineers Premiums.**—Among the premiums awarded by the Institution of Civil Engineers for papers read during the past session is one to Mr. G. D. Snyder, of New York, on "Notes on City Passenger Transportation in the United States." We published an abstract of this paper on page 135 of our March 6th issue.

**The British Electrical and Allied Manufacturers' Association.**—The following firms have recently become members of the Association:—Alley and MacLellan, Ltd., Peter Brotherhood, Ltd., The Dowsing Radiant Heat Co., Ltd., The Electrical Apparatus Co., Ltd., George Ellison, J. H. Holmes and Co., Premier Accumulator Co., Ltd., Wandsworth Electrical Manufacturing Co., Ltd., Whipp and Bourne. The firm of Jaeger Brothers has become an Associate Member.

**Finsbury Technical College O.S.A.**—A jovial concourse gathered at the Waldorf Hotel on Friday evening last on the occasion of the seventh annual smoking concert of this Association. The varied programme was excellently carried out, and credit is due to Mr. C. B. Naudand for its arrangement and to Mr. R. W. Clark, the concert secretary, for his activities in bringing about such a satisfactory result. During the evening the Chairman, Mr. Julian L. Baker, announced that Mr. W. J. Tennant had found himself unable longer to carry on the duty of editing the Magazine, which he has done since the founding of the Association. Mr. E. W. Moss had been asked to take on the duties of editorship, which he was pleased to say he had undertaken to do.

### THE INSTITUTION OF ELECTRICAL ENGINEERS COUNCIL ELECTION.

HIGHEST GRADE MATERIAL and  
WORKMANSHIP.

### BROWN, BOVERI & CO., Limited

CAXTON HOUSE, WESTMINSTER, LONDON, S.W.

And at MANCHESTER, GLASGOW,  
and NEWCASTLE.

would then be lagging by 45 degrees. With the machine overloaded to a little under three times its normal load the phase angle would be zero, so that up to this limit the machine still acts as a phase advancer. Applying this machine to the group of induction motors previously considered with a power factor of 0.7 this is increased to 0.9, and the added motor will have a rating of 60 k.v.a. and will take 25 kw. without increasing the line current. The cost of the motor is about £120, of which £70 must be debited to it as a motor and £50 as a phase advancer. So that 25 kw. of saleable power are produced with an expenditure of £2 per kw. If the customer purchases the plant a discount of 5 per cent. in the power used will provide 10 per cent. for interest and sinking fund under the worst conditions likely to prevail. The author also refers to the system of metering devised by Professor R. Arno, of Milan, as a result of extensive investigations as to the cost of generation and transmission of energy as affected by power factor. A small lag is given to one element of the meter so that it registers approximately k.v.a.-hours.

#### DISCUSSION IN LONDON.

Mr. W. M. MORDEY opened the discussion by pleading for more practical attention being given to the subject of condensers for power-factor improvement. He estimated that of the advancers described, the Author's machine cost about 10s. per k.v.a., and in 1905 he calculated that the cost of Mansbridge paper condensers would be about £1 per k.v.a., but this ought to be much lower now. The tests so far carried out indicated that the advancer caused a large increase in the slip of the motor, which would be very objectionable in some cases; but he expected great developments in some directions, especially in railway work, where by this means smaller and lighter motors could be used. The condenser improved the system, and not the motors.

Mr. A. W. ASHTON, to indicate the progress made in the use of condensers for power-factor correction since the reading of Mr. Mordey's Paper, then gave a list of some of the places where they had been installed. This list included one of 4 mfd. capacity at 7,000 volts for the Midland Electric Power Corporation. No one firm had fitted dynamic phase-advancing apparatus to such an extent he contended, and no single case of breakdown had come to the manufacturer's ears. He could not agree with the Author's figures as to the saving effected by

a consumer using phase advancers and being given a discount of 5 per cent. The 2 per cent. loss thereby occasioned exactly wiped off the advantage of the 5 per cent. discount. A further 5 per cent. was also necessary to allow him to write off the capital. The efficiency of condensers might be taken as 99.5 per cent.

Mr. H. W. BOSWORTH (Lancashire Dynamo and Motor Co., Ltd.) disagreed with the Author's results given in the Paper that the proportionate increase in the amount of dynamic machinery required if rotary condensers are used, compared with extra generating plant, is about 30 per cent. He estimated that when the effect of power factor is taken into account that the increase is only about 5 per cent. Rotary condensers also had the advantage that they could be run at a very high speed. He pointed out that in actual practice the Lancashire Dynamo and Motor Company's self-starting synchronous motor had two resistances. After the first is cut out the exciter is put on through a resistance of its own. All the operations are done by turning one wheel.

Mr. F. CREEDY pointed out that with the Miles Walker advancer the motor slip can be brought to zero if desired by brush shifting. He asked why shunt advancers have not been developed, as these could improve the power factor at no load.

Mr. J. T. IRWIN (City and Guilds Engineering College) suggested that a bigger phase displacement could be obtained with the Kapp Vibrator by affixing one end of a long lever attached to the armature to the mid-point of a spring, preferably an air buffer.

Professor KAPP, in reply, said that his vibrator had not been tested with a motor specially built for it, but there would be no difficulty in reducing the increase in slip due to its use to a very small amount if the two machines were correctly proportioned. He laid great importance on the fact that with dynamic advancers a smaller motor can be used at a higher efficiency. Shunt advancers had been made, but he had not dealt with them. With Mr. Irwin's arrangement a larger phase displacement for one particular load could be obtained, but the vibrator could not then work so well at other loads. He was very pleased with it as it stood, and did not want to complicate it.

#### DISCUSSION AT BIRMINGHAM.

Mr. R. A. CHATTOCK (City Electrical Engineer and Manager, Birmingham) said that there would be no very substantial saving effected on the mains of his system by the use of phase advancers, because the greater proportion of the mains was between the sub-stations and the generating station, and there was practically no lagging current owing to the use of rotaries in the sub-station, which can take a leading current if required. He did not like the idea of a special discriminating meter such as that devised by Professor Arno, as he thought it would not be understood by consumers, and be mistrusted by them.

Mr. A. R. EVEREST (B.T.-H. Co.) remarked that self-starting synchronous motors had been known in America since 1894, and had been extensively used in that country for a long while.

Dr. M. L. KAHN (G.E. Co., Witton Works) said that the frequent inquiries which his firm now receive for self-starting synchronous motors prove the demand for these machines.

Mr. R. O. ORSETTICH (Chief Engineer, G.E. Co., Witton Works) saw a great future for phase advancers, especially in mines, where it is difficult and costly to add to the cable system when increases in the power demand have to be met. There is no difficulty in using self-starting synchronous motors if four times full-load current is not objected to; he thought the reason why these machines were more used in America was because the power stations were of such large capacity that the supply companies did not object to the big current rush which arises on starting up large machines of this type.

Mr. SHUTTLEWORTH (B.T.-H. Co.) stated that a power company in the North had already ordered three phase advancers. To increase the power factor from 0.8 to unity would, he said, increase the rotor current by 13 per cent.

Dr. W. E. SUMPNER (Municipal Technical School, Birmingham) regretted that Dr. Kapp had not given fuller particulars of his phase advancer.

Mr. A. M. TAYLOR (Electricity Supply Department, Birmingham Corporation) calculated that the utmost rebate a supply company could offer would be 1 1/2 to 2 1/2 per cent., instead of 5 per cent. as stated by the Author, the reason for this being that supply engineers had in most cases already discounted for the power factor of their generators, and there was not the margin on the steam side amounting to an extra 25 per cent. which the Author's premises would involve. In the case of a general D.C. supply from sub-stations, the electrical side represented only some 10 per cent. of the capital outlay on the system. The Supply Company would therefore have to face some 90 per cent. of that spent per kw. on its existing consumers, together with additional fixed charges. The additional 4 per cent. loss on the consumer's motor had to be paid for from somewhere. He thought that 50 per cent. of the fixed charges could be saved by the use of a phase advancer, and suggested the use of synchronous motors and batteries in sub-stations.

Dr. KAPP replied briefly, and gave a demonstration in his laboratory of the working of his phase advancer and of the Scherbius advancer.

## ELECTRICAL ENGINEERING IN THE MINING AND METAL INDUSTRIES

### SUGGESTION TO USE THE THURY SYSTEM IN MINES

A PAPER by Mr. S. F. Walker on the application of the Thury high-tension continuous current series system to mining work was discussed at a meeting of the Western Local Section of the Institution of Electrical Engineers on April 14th.

The author, in giving an outline of the Thury system, explained that the high tension used was quite incidental, and the chief feature was that the circuit was always closed, irrespective of whether work was being done on the system or not. There was, he said, no such thing as a short circuit to contend with, nor could there be overloading of motors with consequent burn-outs. To start a motor it was only necessary to open a double-pole switch and to rock the brushes of the motor until it took up the work it was required to perform. To shut the motor down, the brushes were simply rocked back to the neutral point and short circuited. He assured the members present that commutation troubles had been satisfactorily overcome. For such duty as winding engines, pumps, fans, &c., a Thury motor was in every way a success, and he did not see any reason why the system should not be taken down the pit shaft and used underground. He proposed the adoption of motor generators at the pit bottom, and distributing on the same system to groups of as many as four coal-cutters at the "face," limiting the pressure of distribution to, say, 200 volts or even less. He thought that the added expense of the plant would be well compensated for by freedom from danger of shock. One of the chief characteristics of the Thury system was that everything was insulated. Not alone is it necessary to insulate each motor from earth, but each motor must be insulated from the plant which it is intended to run. He did not think, however, that there would be any difficulty in carrying this out satisfactorily. To insulate the plant underground, he suggested building an invert and arch, and filling the floor in with asphalt, setting the plant on concrete foundations resting on glass insulators, and filling in around the concrete foundations with bitumen. It was interesting to note that the efficiency of a Thury motor only varied 5 per cent. from one-fifth to full load, the full load efficiency being as high as 95 per cent. on reasonably large motors. He recommended that each group of mines should have its own local Thury distribution system, the generator being driven by a motor fed from the main Thury transmission line. It was quite possible, however, to take the one system through all the motors of one mine, and proceed to the next, and so on till you returned to the generating station. The simplicity of the generating station would appeal to engineers. No switchboard was required, each set only requiring its own switch pillar. He would suggest running the generators in tandem by means of turbines, and placing the switch pillar by the side of the generator on the engine-room floor. In comparing the losses on three phase and the Thury system for a typical 500 kw. installation, the author made out that for three phase the losses per day would amount to approximately 320 kw.-hours against 168 kw.-hours for the constant current. With a 3,000 kw. typical installation the losses on three phase would be approximately 1,473 kw.-hours against 648 kw.-hours for constant current.

Mr. R. RUTHERFORD (General Manager, Rhymney Iron Co.) suggested that the Thury system might lead to cheaper rates from power-supply authorities. On account of the  $C^2R$  losses, however, the system was one essentially for good load factors.

Mr. F. S. CARTER (Chief Engineer, Baldwins, Ltd., Port Talbot) suggested that among the points which would render the system unsatisfactory, there would be great difficulty in maintaining good insulation underground. For haulages of 1,000 h.p. or more, insuperable difficulties would be presented by having to insulate the machines on shifting ground. The necessary insulation of couplings for large motors would also present difficulty. There would also probably be difficulty in dealing with commutation on the high-speed turbo-generators to which present-day practice tended. The system, however, appeared to be a good one for winding and fans.

Mr. C. G. MORLEY NEW (Assistant Engineer, Cardiff Tramways) said that cable losses would swamp any advantage the

system might have. He also drew attention to the idle current losses and the difficulty in couplings breaking.

Mr. A. NICHOLS-MOORE (Newport Corporation Tramways) thought in comparing the losses on three-phase and constant-current the Author was hardly fair to three-phase in basing his figures for three-phase on practice of 1903. He found no difficulty in obtaining transformers of 100 kw. capacity with an efficiency of 98.7 per cent. He also considered high-voltage commutators on high-speed machinery were a very bad feature, and if the author had compared costs rather than losses the Paper would have been far more valuable.

Mr. J. LAING WILSON (Callender's Cable and Construction Co.) thought there was much to be said in favour of the system for transmission, but he considered three-phase was much the better for distribution to consumers. With the Thury system a break in the cable would mean the stoppage of all motors. There was also the question of the full  $C^2R$  losses to be considered.

Mr. J. W. MORCAN considered that great difficulty would be experienced in keeping plant in line, as it was absolutely necessary to pack up foundations in some collieries at least once a month. There was also the question of breakage of cables due to "falls." One of the great advantages three-phase had over the Thury system was that lighting was always easily available instead of its being necessary to have innumerable motor generators scattered over the mine.

Mr. W. A. CHAMEN (General Manager of the Treforest Electrical Consumers, Ltd.) was under the impression that there was a future for the Thury system, and though he understood the inventor put his system forward for transmission only, there was no reason why in certain cases it should not be a success applied to mine distribution.

Mr. S. F. WALKER said that he would propose introducing a number of short-circuiting devices so as to cut out any faulty circuit. There was every probability of a cable earthing if a severe fall occurred. The earthing of the main, however, would not interfere with the supply. In dealing with the trouble of shifting ground, it was only a question of building the containing room strong enough. There was no question, however, that good insulation was the great point, and this could be provided for better than a good earth at the "face." It was also only a question of money to keep the voltage low enough on coal-cutters. He admitted that at present lamps were not designed for currents in the region of those employed at present on the Thury system; he thought some time such lamps would be made. In the meantime, one had the alternative of introducing motor generators.

**Wireless Telephony in Mines.**—According to the *Colliery Guardian*, experiments are being conducted at Dinnington Main Colliery, Yorkshire, on a system of underground wireless telephony of German origin, by which it is claimed that conversation can be carried on through 1,500 yards of solid rock.

**The Strength of Metal Filament Lamps.**—The General Electric Co. have sent us some further testimony of the ability of the Osram Drawn-Wire Lamp to withstand shocks and jars. About three months ago they supplied to the Niddrie & Benhar Coal Co., Ltd., Portobello, a number of 100-volt 16 candle-power traction type Osram lamps, to be installed at the pit-heads and picking tables, where vibration is extremely severe, but the following unsolicited report shows that the lamps are quite adaptable for this kind of work:—"The Osram Lamps in use under these severe conditions prove most satisfactory, and show a much smaller percentage of breakages than the lamps of other makes fitted in the offices where there is very little vibration. It may also be interesting to note that no shock absorbers are in use."

**Reducing Costs by Electrical Working in Mines.**—At a recent meeting of the Birmingham Branch of the Institution of Mining Engineers Mr. S. F. Sopwith, in describing the electric power plant at the Cannock Chase Colliery, said that electricity had been adopted to reduce consumption of coal at the colliery, and to provide a means of transmitting power underground for haulage and other purposes. The capital cost of the installation had been £21,259, and by the adoption of the scheme the colliery consumption had been reduced by at least 1½ per cent., or 6.875 tons. About 25 horses had been dispensed with underground, and a great reduction in labour had resulted from the substitution of mechanical for horse haulage. He computed that the total saving represented about 18½ per cent. interest on the capital outlay.

## ELECTRICITY IN THE TIN-PLATE INDUSTRY

IN the course of a Paper on recent developments in the tin-plate trade by Mr. H. Spence Thomas published in the Proceedings of the South Wales Institute of Engineers, the author referred to electrical driving of tin-plate mills, and said that the credit of being the first to adventure and succeed in this direction was due to the Redbrook Tinplate Co., Ltd., and Mr. A. Taylor, their Managing Director.

At their Tynwydd Works, he continued, a 100-h.p. Siemens motor was installed under the direction of Mr. Graham M. Stevenson, to drive one mill by ropes. The power is three-phase 25 cycles alternating current, 2,200 volts, supplied by the South Wales Power Co. Lately at Swansea there has been laid down a fine electric installation having twelve mills driven by three motors. The whole of the current for the works is generated by steam on the spot, and it is said to be a part of a huge scheme of blast furnaces and steelworks. Messrs. Siemens are largely responsible for this plant also. Melingriffith works introduced last summer an electric motor as a standby in case of failure of the water supply to the 300 h.p. horizontal water turbine driving the three 28-inch by 24-inch diameter mills through a 120-ton 36-foot diameter flywheel. Another standby drive of one mill from a motor through a 16-inch wide belt on to the 40-ton flywheel is interesting, though not economical in itself. The current is obtained from the South Wales Power Company in both

said that there is an invention out with a view to coating one side only of the sheet of steel, and this by an electrical process, but time will decide as to whether it is of any commercial value. A beginning has been made in the Swansea district to coat black-plates with the metal aluminium (it is said by a cold wet electric process), and it is early yet to state whether they will grow into general use.

**Electrometallurgy in Norway.**—According to the *Board of Trade Journal*, the Hardanger Iron & Steel Works Co. have decided to discontinue the electric smelting of iron of which they were the pioneers in Norway, on account of the cost of the system. Their works near Odda are to be let to a French company for the manufacture of a fertiliser, presumably cyanamide. Another Norwegian electrometallurgical concern, the Bandak electrical copper works, is to be shut down, but this is due to scarcity of ore, though the Hybinette process, which they work is said to be successful. There is a scheme for re-erecting this copper works on the Christiania Fjord. It is also reported that a company has been formed with a capital of £19,400 for the electrolytic manufacture of metallic sodium.

**Branch Meetings of the Association of Mining Electrical Engineers.**—At a meeting at Chesterfield of the Notts and Derby Branch of the Association on April 17th it was decided to hold one meeting a quarter at Chesterfield, one during the session at Mansfield, and the other monthly meetings at Nottingham. A Paper by Mr. C. Jones on cable jointing and junction boxes

GENERAL ARRANGEMENT OF ELECTRIC DRIVE FOR TIN-PLATE ROLLS, TREFOREST.

cases. There is a works in the Llanelly area driven entirely by electricity supplied by the local power company. In all the foregoing cases the motors run considerably faster than the mill shaft. At Treforest works an electric motor of a slow-running type, about 35 revolutions per minute, is being attached to the mill shaft direct, and in this case, with gearing and friction reduced to a minimum, some very low costs for power should be obtained. This design on the electrical side is based on the same principle as embodied so successfully in bar mills of various kinds; the Skinninggrove bar-rolling mill being the last plant on these lines in England to get to work. Messrs. Siemens are again responsible for the electrical work, whilst Mr. J. W. Morgan is the consulting engineer, and with such a good load factor available, the South Wales Power Co.'s charge per unit will probably be low.

We reproduce here from the Paper a sketch of the general lay out of the plant. It will be noticed that the mill was formerly driven by a water-wheel, and that the driving system involves a main induction motor, the current from the slip-rings of which is led to a rotary converter, which supplies an auxiliary D.C. motor on the main shaft, thus enabling the set to utilise the energy which would otherwise be wasted in resistances in the motor circuit when running at speeds lower than the maximum. This system is known as the Krämer system, and an example was described in *ELECTRICAL ENGINEERING*, June 13th, 1912, page 321.

Other applications of electric power briefly mentioned in the Paper are the working of shears which are sometimes driven in groups from a line shaft by a single motor, or, especially in America, by separate motors, and electric cranes. The author does not hold out any great hope of the ultimate adoption of electrical tinning processes, and remarks that apparently there is something in the nature of the metal tin, in its relation to iron and steel which prevents the formation of an alloy, and the proper union of the two metals, so far as experiments up to date have gone.

Steel plates, he continues, have been coated with tin by means of electricity, but only in an experimental stage. It is

was discussed. At a meeting on April 18th at Glasgow of the West of Scotland Branch, Mr. M. Brown was elected President of the Branch, and Papers by Mr. J. McCann on electric coal cutters, and Mr. E. K. Scott on shaft cables, were discussed.

**Shaft Lighting during Sinking.**—At the inquiry into the remarkable fatal accident at Rufford Pit, Mansfield, resulting from the over-winding of a water barrel during sinking operations, caused by a temporary shelter over the engineman falling on him and preventing his stopping the engine, Sir A. Markham referred to the danger in such a case of lighting the shaft from a cable in the ordinary way, as in case of such accidents the cable was apt to be carried away. In his own collieries he had substituted large electric safety lamps hung in such a way that in case one or two were carried away, the place would still be illuminated.

**Electric Signalling and Power Plant for Collieries.**—At a joint meeting of the North Staffordshire branch of the National Association of Colliery Managers and the North Staffordshire branch of the Association of Mining Electrical Engineers, at Stoke-on-Trent, on April 12th, a Paper by Mr. W. A. Heyes was read, entitled "Notes on Signals, Bells, and Batteries." The author deplored the lack of attention usually paid to electrical signalling systems at collieries. He spoke of the excellence of the Leclanché battery when properly looked after, but said that dry cells were coming into use to an increasing extent. He had worked out that current from signalling batteries cost about 25s. per unit, or about 600 times as much as current for power purposes. In the discussion Mr. H. Lee referred to a case where a small motor-generator was used with success instead of batteries, and another speaker said that the condition of the signalling gear at most collieries was not as bad as had been made out. A Paper on colliery generating plant was afterwards read by Mr. W. Bolton Shaw, who dealt principally with gas-driven plant. Whether gas or steam plant was to be used was an economic rather than an engineering question, and whether coke-oven or blast-furnace gas was best employed in gas engines or gas-fired boilers depended largely on the quality of the gas. Sometimes it paid better to extend an existing steam plant by the addition of gas-fired boilers rather than incur the large capital expense of purifying plant. Gas from the bee hive type of oven could only be used for steam raising.

## GATE-END BOX FOR DOCKS AND MINES

PORTABLE apparatus calls for switchgear of a design differing materially from that which serves for stationary applications of electric motors. One of the chief points of difference is that the stationary motor can be earthed at the place where it is situated, whereas with the portable motor the earth conductor must come back to the switch, at which point means must be adopted for affording an effective earth connection. The gate-end box which is shown in the accompanying illustration, for which the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), are responsible, embodies precautionary measures essential for this class of work. It consists of a standard ironclad-switch and fuses, with the usual device for preventing the switch-cover being opened with the switch at the "on" position. This switch is interlocked with the plug, to which is connected the flexible cable

A GATE-END  
BOX FOR  
DOCKS OR MINES.

running to the motor. This interlock refuses admission to the plug with the switch closed, and prevents the plug from being withdrawn when the switch is closed. The earthing conductor is brought back from the motor to the plug, and here it is connected to special terminals which make contact with others in the plug socket. These contacts are so arranged that the first thing done on the insertion of the plug is the completion of the earth circuit, and the last thing on its withdrawal is the breaking of the earth circuit. The result is that the motor can never be under pressure with the earth connection unmade. The lower part of the interlocking bar is protected from damage by an iron tube. The interiors of the switch and fuse cases are well protected against arcs, and adequate clearances are given between the fuses and case, and between the switch blades and case. It will be remembered that the Home Office has recently called attention to the fact that many switches are defective in this respect.

**Electrical Equipment of New Pits in Scotland.**—It is reported that two new pits which are being put down on the Craig estate, Dreghorn, Ayrshire, will be provided with very complete electric equipment, including electric winding plant.

## ELECTRICAL MINING AND METALLURGICAL PATENTS OF APRIL

## Mining.

THE Patent Specifications published during April of particular interest to mining electrical engineers include No. 13,171/12, by A. Hepburn, describing a connector for the ends of the armoring of cables, in which is provided a ring of channel-section and one or more radial lugs. The armoring of the cable is stripped off the end of the cable and bent outwards, so as to enter the channel in the connector, the joint being then brazed or soldered. A metallic cap is also provided, and is secured to the base by bolts. The base may be cast in one with the joint-box if desired. This connector may be attached to the cable at the cable-makers' works. The construction is clearly shown in the figure.

CABLE ARMOURING CONNECTOR.

Specification No. 27,281/11, by A. Philip and L. J. Steele, covers the construction of a draught-proof catalytic detector, in which the catalyst, in the form of a wire, is mounted in a large chamber having protected inlets on the same side of the casing, so that the gas supply is by natural draught only. The detector is joined to an indicator (portable galvanometer) arranged for connection with an ordinary miner's lamp. Specification No. 3,002/13, by the same inventors, covers the arrangement of the catalysts in the form of a Wheatstone bridge, two wires being active and two not. A galvanometer is connected across in the usual way, and with pure air gives no deflection when the arms are balanced. The catalysts may be made by squirting special alloys or they may be of platinum and palladium. Voltage and temperate corrections are applied.

An improved construction of blasting detonators, in which a metal tube, having in one end an insulated plug tightened by compressing the tube, and having one wire passing through the plug and one connected to the tube, is described in specification No. 16,963/12, by J. Sou (France). One of the poles of the circuit is made by widening the end of the conductor situated in the axis of the plug, a metal disc (e.g., Dutch gold) in contact with the tube being embedded in the charge. Alternatively, a platinum-iridium wire on top of the charge at the base of the plug is connected between the two poles and ignites the charge by incandescing. In the former method ignition is caused by the spark between the two poles.

## Metallurgical.

The specifications relating more particularly to the metallurgical industry included No. 9,203/12, by L. Ubbelohde (Germany), for a resistance furnace, in which a wire resistor (an iron-nickel alloy is suggested) is wound on a non-conducting tube and surrounded by a porous insulator, which is in turn surrounded by a layer of carbon to protect the resistor from oxidation by the reducing action of the carbon. The insulator may be made of alumina 63 per cent., burnt clay 27 per cent., and finely picked asbestos 10 per cent., together with  $\frac{1}{2}$  to  $1\frac{1}{2}$  per cent. of water glass by weight. It is made plastic by a solution of soda. Specification No. 14,164/12, by A. Helfenstein (Austria), covers an induction furnace. The casing is connected up as a conductor in the secondary circuit, so that it forms with the heated conductor a loop as free as possible from self-induction.

G. Tischenko (Russia), in specification No. 5,855/12, describes an apparatus for refining scrap-iron by electrolysis,

in which both anode, which may be lead-lined, and cathode consist of vertical concentric cylinders so arranged that either can be separately raised. The anode may be in the middle or surrounded by a double-walled cathode open at the top, having the lower wall perforated.

### THE HOME OFFICE REGULATIONS

THE text of objections which have been made to the draft general regulations issued by the Home Office under the Coal Mines Act, 1911 (ELECTRICAL ENGINEERING in the Mining and Metallurgical Industries, February 6th, p. 74), has now been published. The rules affecting the use of electricity in mines contained in Part III. embody the existing special rules, so that only drafting changes are necessary. However, the Miners' Federation of Great Britain asks that Rule 117 shall make it obligatory to post in the top of the pit a sketch plan of the main roads, the escape roads, and the telephone station.

The National Association of Colliery Managers asks that paragraph 68 in Part II. should be amended to read as follows:—"Use of Electric Lamps other than Locked Safety Lamps.—In any mine or part of a mine where safety lamps are required to be used, electric lamps, if enclosed in air-tight fittings and having the lamp globes hermetically sealed, may, subject to the provisions of the Act, and any regulations made thereunder as to the use of electricity in mines, be used within the following limits:—(a) On main intake airways and mechanical haulage road ventilated by intake air. (b) On mechanical haulage roads in main return airways, so long as the percentage of inflammable gas in the general body of the air in that place does not exceed 1½." This is less restricted than the original paragraph, which also did not include electric lamps.

With regard to telephones, the regulations, paragraph 91, state that "if in any mine, not being a small mine, the distance, as measured by the shortest route along the roadways, of any part of the workings from the nearest shaft or outlet by which persons enter or leave the mine exceeds 1,000 yards, efficient means of telephonic communication shall be provided and maintained between the point at which the tubs coming out-by from that part of the workings are finally made up into sets or trains, or are attached to the rope of an endless rope system, and the shaft or outlet and the surface of the mine." The Mining Association of Great Britain suggests an amendment by which the distance would be increased from 1,000 yards to 1,500 yards, and would be measured simply from the main haulage to the shaft. The Miners' Federation would make the rule as it stands apply to all mines, and the Northumberland Colliery Enginemens' and Firemen's Association would reduce the distance to 500 yards. The Bristol owners ask that, as owing to the faulty and complicated nature of the strata there are in most of the collieries no general systems of haulage with general stations where the tubs are finally made up into sets or trains, the collieries on the Bristol coalfield shall, like the mines of statified iron-stone in the Cleveland district, be exempt. In Part IV., dealing with rescue and ambulance, the Miners' Federation asks that it shall be compulsory, paragraph 139 (b), for tracings to be kept at every mine showing the positions of the telephones, as well as the other items specified.

Objection is also taken by several bodies to the early date, April 1st, at which these rules should come into force.

**Electric Miners' Lamps.**—The Home Office has given notice of an order, made on April 18th, approving the Sussman Lamps Nos. 3 and 4 for use in all mines to which the Coal Mines Act applies, subject to certain conditions.

**Electrical Accidents in Mines.**—Three men lost their lives on April 8th at the Blaenavon Company's pit (Monmouthshire) through suffocation by smoke due to timbers having been set on fire and causing a fall of roof. It is alleged that the fire was due to short-circuiting of a cable supplying a haulage motor.

At the new London pit of the Digby Colliery Company a young man named A. Naylor died from an electric shock from a 450-volt circuit. It appears that the deceased stumbled over a rail when going to a switchbox to switch off the current from a conveyor motor, and fell on to the wires leading to the box, pulling a live lead out and weakening the earth wire. On examination some of the screws fastening the terminals were found to be missing, although several witnesses saw them in place a day or two before. The apparatus was being altered to meet the recommendations of the Inspector of Mines.

# QUESTIONS AND ANSWERS BY PRACTICAL MEN

## RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelopes.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,336.

"MAN," who propounded this problem (published in our last issue), gave the distance between centres of the desks as 3 ft. 9 in. instead of 9 ft. 3 in. The time for sending answers is therefore extended to Monday, May 5th. Readers who have already sent in replies may send amended answers.

### QUESTION No. 1,337.

Coal Mines Act Electrical Rules:—Rule 14, C (1), requires "the thorough examination of all apparatus (including the testing of earth conductors and metallic coverings for continuity) as often as may be necessary to prevent danger; and (2) the examination and testing of all new apparatus, and of all apparatus re-erected in a new position in the mine before it is put into service in the new position." Under ordinary circumstances how often will it be advisable to test earth conductors and metallic coverings, and what other "examination and testing" is necessary on the following plant? How may we prove that we have continuity and suitable carrying capacity of all armour and earth conductors? We have two 2,000-kw. generators, 3,000 volts, 40 cycles, three phase; current is transmitted at this pressure to three seams at different depths. In these seams we have haulages working direct at 3,000 volts; also in each seam we have transformers stepping down to 440 volts for pump motors and small haulage, and small lighting transformers 440 to 110 volts. The cable from the H.T. switch-board in the power-house to each seam is three-core, paper-insulated, lead-sheathed, and double-wire-armoured; it is fixed to sides of shafts by wooden cleats, and the shaft is comparatively wet. We use the lead sheath and armour as our main earth connection to surface earth plate. The shaft cable is led to a distribution board in each seam, from which all cables in use are also double-wire armoured, and the armour in every case is used as main earth wire between each motor, &c., and main cable armour to surface. I may mention here that in some places the cables are buried in the ground. We have two C.I. earth plates at the surface, and one in the sump at each seam. We transmit about 600 kw. into each seam. The depths of the seams below surface are 400 yards, 500 yards, and 680 yards. At each motor we connect up the switch, controller, motor frame, &c., to a common copper earth wire, and this to armouring of cable by means of W.I. clamps, as, of course, we cannot solder terminals on here underground.

"ASSISTANT ELECTRICIAN."

(Replies must be received not later than first post, May 8th.)

### ANSWERS TO No. 1,335.

It is proposed to make a purchase of six booster rotary converters and transformers operating from A.C. to D.C. Describe the necessary tests, stating points which should be watched.—"Met."

The first award (10s.) is made to "Rota" for the following reply:—

The necessary tests from the point of view of the purchaser are to determine (1) the heating, (2) efficiency, (3) operation, (4) regulation, (5) starting. There are several possible methods of taking the heat run. If the load on the station where they are installed is fairly steady, it may be possible to hold the load constant at the rated figure on one or two of the machines

until the final steady temperature is reached, testing the different machines in turn. Owing to the almost unavoidable fluctuations in the load, this method is seldom satisfactory. The machines can be loaded on to a temporary water rheostat, but the power absorbed is, of course, wasted, and would amount to a heavy item for a heat run on six large rotaries. The best method is to run the machines in pairs "Hopkinson," testing each rotary with its own transformer. Each pair of transformers is then connected in parallel on the high-tension side, and connected to the supply through a wattmeter, and the rotaries are connected in parallel on the D.C. side through an ammeter and circuit-breaker. The booster fields should be excited (if necessary) to give the required D.C. voltage, usually the maximum volts of the guaranteed range. The machines are then run up from the A.C. side, and before closing the D.C. switch a voltmeter is connected across the switch and the circuit-breaker in the other line. If the voltmeter reads approximately twice the true D.C. volts, one of the rotaries must be made to "slip a pole" by momentarily disconnecting it from the supply. This will reverse its polarity, and the booster fields can then be adjusted so that the opposing voltages are equal. When the voltmeter across the switch reads zero, the switch is closed, and by reducing the booster field on one machine and increasing it on the other the D.C. voltages can be made to differ sufficiently to send full-load current through the machines and transformers (measured on the D.C. ammeter), while the D.C. voltage is at the required figure. Temperatures should be taken by thermometers fixed to two of the main poles, two of the commutating poles, and two of the booster poles of each machine, also to one or two points on the windings and core of each transformer, and one thermometer should be suspended to show the temperature of the oil at the top of each transformer. (It is assumed that "Met" is familiar with the method of fixing the thermometers usually adopted.) When the temperature ceases to rise, the machines should be shut down and the temperature of the rotary and booster armature windings and core, and of the commutator and sliprings, can be measured. It is usual to allow a temperature rise as measured by thermometer of about 40° C. above an air temperature of 25° C. A steady temperature will be reached in from four to eight hours, depending on the size of the machines. During the heat run the reading of the A.C. wattmeter will give the power input which represents the losses in the two sets. Readings are also required of the D.C. amperes  $I$  and terminal volts  $V$ . Then, if  $W$ =power measured by A.C. wattmeter, the efficiency of each machine is given by

$$E = 2AV \div (2AV + W).$$

As a check on this figure, the light running losses and hot resistances may be measured in the usual way, and the sum of these for the two machines, plus the brush C'R losses on the commutator and sliprings, should check closely with the wattmeter reading. The armature C'R calculated as for a D.C. generator requires to be multiplied by a factor depending on the number of sliprings, the power factor of the A.C. input, and the voltage ratio. This factor has the following values at unity power factor: two-phase machine (four sliprings), 0.38; three-phase machine (three sliprings), 0.57; six-phase machine (six sliprings), 0.27. These figures assume that the A.C. to D.C. voltage ratio is normal. (The calculation of the factor for power factors lower than unity and for various amounts of excitation of the booster field is too long to be described here.) The armature resistance is conveniently obtained by measuring the resistance between any two sliprings which are connected to points on the armature one pole pitch apart. With regard to operation, this should be sparkless from no load to, say, 25 per cent. overload, and without serious sparking up to the maximum overload specified, both at the minimum and the maximum D.C. voltages. This can be observed during the Hopkinson run, remembering that the machine which is being tested for operation must run A.C. to D.C. The machine with the weaker booster field when running Hopkinson will be running D.C. to A.C., and the operation will probably not be so good as if running under normal conditions—in fact, it is probable that it will be necessary to rack the brushes slightly from the true neutral to give good operation on the inverted machine. The actual best position can, of course, be determined on test. Regulation and compounding readings can also be taken with the machines coupled Hopkinson, of course, on the machine running A.C. to D.C., the load being varied by the booster of the other machine. Since the rotaries are to run A.C. to D.C. it is probable that they are required to start from the A.C. side. They may be started for the Hopkinson run by the method which will be employed in service (taps on the transformer, or a starting motor), and if a maximum starting current has been specified, an ammeter in the A.C. circuit will show whether the machines comply with the guarantee. If starting by means of transformer taps, the field splitting switch (if

provided) must be opened while running up, and may be employed to "slip a pole" if it is necessary to reverse the voltage on one rotary as described above. If starting by means of an induction motor, the synchroniser connections should be checked by means of a voltmeter across the terminals of the paralleling switch before paralleling for the first time. These and other points, such as connection diagrams, &c., should, however, be fully covered by the instruction book supplied by the makers. It is, of course, necessary that the A.C. voltage and periodicity should be held constant at the rated figures throughout the tests. The starting test in particular is greatly affected by any drop in the supply voltage, due to the sudden load. Also all the tests should be taken with the machines running at unity power factor, unless otherwise specified in the guarantees. A simple method of determining this is to watch the ammeter in the A.C. circuit while adjusting the rotary main shunt field. Unity power factor gives the minimum ammeter reading for a given load.

The second award (5s.) is made to "A. M.," who suggests practically the same tests, and mentions that there are two sets of tests which the machines have to pass. These are: (1) tests at the maker's works, and (2) tests under service conditions on site, the latter consisting of a day's run at full load, maintained by hand regulation, in parallel with others, while the former are similar to those given by "Rota," except that a 24 hours' full-load run is proposed so as to make sure that the transformers, if oil cooled, have attained a steady temperature. It is, however, suggested that the core loss should be determined, and regulation and compounding tests made, while the only high pressure insulation test advocated is to subject the machines to twice working pressure for five or ten minutes.

### EXTENSIONS AT BLACKPOOL ELECTRICITY WORKS

THE ceremony of formally starting up the two new turbo-generators in the Blackpool Electricity Works took place on April 23rd. On that and the following day there was also an exhibition of heating, cooking, and lighting apparatus and other domestic appliances, while cooking demonstrations were given by Ferranti, Ltd., and the British Electric Transformer Company.

The new sets installed consist of a 1,500-kw. turbo-alternator for lighting, erected by the British Thomson-Houston Company (Rugby), and an 800-kw. mixed pressure turbo-generator for traction erected by the Brush Electrical Engineering Company (Loughborough). Exhaust steam from the existing Ferranti and Browett-Lindley engines is used in this case. The ventilating air for each machine passes through a special air filter, supplied by Balcke & Company (Broadway, Westminster, S.W.) capable of dealing with 9,000 cubic feet of air per minute. A barometric condenser by the Klein Engineering Company has been fixed, and can maintain a  $27\frac{1}{2}$ -in. vacuum, while the Rees-Roturbo electrically-driven circulating pump can deal with 200,000 gallons of water per hour. The total plant capacity is now lighting, 4,300 kw., and traction, 2,250 kw.

### THE "POINT FIVES"

A MEETING of the "Point Fives" (which, as most of our readers know, is a club composed of engineers to undertakings where electric current for heating and cooking is supplied at the rate of one halfpenny per unit) was held on April 18th at Bradford, where the Chairman, Mr. T. Roles, welcomed the members. Mr. W. G. Pickvance (Wrexham), Mr. H. Gray (Accrington), and Mr. S. E. Fedden (Sheffield) were elected members. Mr. F. W. Purse, although he could not be formally elected until he took up his duties at Carlisle, was invited to attend the next meeting, and Mr. Allen, who ceases to be a member on leaving Carlisle, was elected an honorary member for twelve months to give him time to introduce a 0.5 tariff at Wolverhampton. Mr. Roles gave a long address devoted to the development of the heating and cooking load at Bradford, where the headway was almost solely due to the  $\frac{1}{2}$ d. per unit tariff, which has been in force since July, 1910. Electric heaters were very popular, and a small number of complete cooking outfits were in use. There was, however, no hiring scheme, and many types of apparatus on the market were not quite suited to the local conditions, which involved the baking of bread at home. With the present lines of cheap radiators available, it did not seem necessary to inaugurate a hiring scheme to popularise their use. Of 918 residence consumers 471 had adopted the special domestic tariff of 15 per cent. per annum upon the rateable value plus one halfpenny per

unit. The total capacity of heating and cooking apparatus connected to the mains exceeded 1,000 kw. Some interesting statistical tables accompanied the address. There was a long discussion, and it was decided that a special meeting should be held at the Institution of Electrical Engineers on May 23rd, to consider the standardisation of electric cookers and adopting the rateable value plus  $\frac{1}{2}$ d. per unit tariff as standard. The next ordinary meeting will be on June 17th, during the I.M.E.A. convention, and Mr. Blackman will be in the chair. This will be an open meeting, and all desirous of attending should send in their names to the Hon. Sec., Mr. A. H. Seabrook, 19 York Place, Baker Street, W. With regard to electrical publicity, it was decided that owing to the "moribund" state of the Electrical Supply Publicity Committee, the Association must for the time being make its own arrangements for its members' requirements, and a sketch was approved, to be used for posters and postcards. The members of the Association will have the first call on these. They will also be available to anyone at 28s. per 100 plus 7s. 6d. for over-printing name and address for the posters, and 16s. per 1,000 for the postcards. Applications to be sent to the Hon. Secretary, Mr. A. H. Seabrook. Although no resolution was passed, it was felt strongly that this question of publicity is one which the electrical industry cannot afford to neglect any longer, and a lead was looked for from the Industrial Committee of the Institution of Electrical Engineers as to what must be done in this direction.

### REFLECTORS FOR SHOP WINDOW LIGHTING

A GREAT deal of attention has been paid of late to avoidance of glare in shop-window lighting, and very effective results are obtained by lamps in concealed positions provided with suitable reflectors. The British Thomson-Houston Co. (Mazda House, 77 Upper Thames Street, E.C.) have developed a system employing Mazda lamps in conjunction with specially formed silvered-glass reflectors, of which an example is illustrated here. The lighting units are fixed close up to the ceiling of the window, immediately behind the fascia board, and are arranged in a single evenly spaced row. The arrangement gives a more uniform and diffuse illumination than could be obtained from lamps hung

"X-RAY" REFLECTOR FOR SHOP-WINDOW LIGHTING.

in the field of vision, and produces a good effect. The reflectors are of similar construction to those employed in the Company's well-known "eye-rest" system of indirect lighting. The glass is blown in one piece in steel moulds and then annealed and fire-glazed. The outside of the glass blank is plated with pure silver which is protected by several coats of elastic enamel. This process of manufacture renders the reflectors exceedingly durable. The interior surface is formed into spiral and vertical corrugations, which effectually prevent any striation or streakiness in the illumination. The reflectors for shop-window lighting are supplied in six different shapes, giving the various light distributions required.

**The Institution of Electrical Engineers.**—The following is the result of the balloting for new members and transfers from one class to another at the meeting on Thursday:—*Members:* W. H. Eccles, E. S. Heurtley, A. C. Kelly. *Associate Members:* T. T. Baker, A. de Lima Barros, E. H. Bullmore, W. R. Churchill, R. C. Creasey, G. J. H. Elliott, H. Foster, J. F. Mitchell, J. Strachan, E. Stubbs, W. L. L. J. Thain. *Graduates:* F. N. H. Beamish, G. H. Eardley-Wilmot, E. G. Goulding, W. E. Jamieson, J. M. van Nieuwerkerken. *Students:* P. W. Anderson, E. D. Beggs-Robertson, H. Clausen, F. de Gouvêa Freire, W. A. Kennedy, G. N. Le May, F. A. P. Perrow, R. E. Rushforth, C. W. C. Sadler. *Candidates Transferred—Associate Member to Member:* S. E. Bastow, A. W. Beuttell, J. M. Blair, J. J. R. Overton. *Associate to Associate Member:* A. M. Fyfe, H. H. L. Prendergast, A. J. Wray. *Student to Associate Member:* G. H. D. Ascoli, H. J. G. Davison, A. E. Dent, D. Jackson, E. M. Marvin, A. R. Stelling, A. D. Taberner, J. D. A. Vincent, G. W. Wyles. *Student to Graduate:* H. R. L. Groom, S. N. Jackson, A. Kennard, A. C. Patel.

## THE IMPERIAL COLLEGE OF SCIENCE AND TECHNOLOGY

ON Tuesday last representatives of the Press were entertained at luncheon by Sir Alfred Keogh, the Rector of the Imperial College of Science and Technology, South Kensington, in the commodious new Students' Union, when the several buildings which are to house the new and enlarged departments were thrown open to inspection, and the experiments and investigations being carried on were explained. For some time reorganisation and consolidation of the various institutions forming the Imperial College have been in progress, so that instead of there being many departments carrying on more or less the same work within a stone's throw of one another, it is possible for the interchange of students to take place so that the best and most practical teaching of all subjects is obtainable for all. In the new building of the Royal School of Mines there is, among other equipment, a complete full-sized plant for the treatment of various ores, including crushers, shaking tables, slimers, &c., all driven by electric motors. Another and perhaps better known department is the Electrical Department of the City and Guilds (Engineering) College, under the direction of Professor T. Mather, where, in addition to the large and well-equipped general laboratories, the "Traction Bay" is now in full working order. It contains a motor-generator, static balancers and transformers, so that direct current from 100 to 600 volts is available, as well as alternating current of different frequencies and pressures for experiments on traction motors. A full-sized bogie tramcar, with rails and conduit, is also available for testing. In this connection there is a dynamometer for determining the draw-bar pull, and each wheel drives a drum, to which is affixed a flywheel in three sections. These can be coupled together by means of electromagnetic clutches, so that the equivalent inertia of a 5, 10, or 15 ton car can be obtained. Another unique equipment consists of a complete installation of McKenzie Holland electric signalling. In this course, as in others including advanced dynamo design, the foremost experts in the several branches are retained to deliver lectures on their special subjects. In addition, one must mention the large and important department of Civil and Mechanical Engineering, under the direction of the Dean of the College, Professor W. E. Dalby, and the department of Geology, which includes oil production. The latter is, we believe, the only one of its kind in the world. Others of the new departments which have immense possibilities are those dealing with the commercial treatment and preservation of timber and the cultivation of rubber.

## DERBY CORPORATION BILL A New Stand-by Clause

THE Derby Corporation Bill, which is now before Section A of the Local Legislation Committee of the House of Commons, deals in Part V. with the electricity undertaking. At one time a fight with the gas interests seemed probable, as it was rumoured that the Derby Gas Light and Coke Company intended to endeavour to obtain an "electrolysis" clause, and also to secure the insertion of some form of the famous "Bermondsey" clause, or its latest modification, known as the "Winchester" clause. It has, of course, been the settled practice of Parliament for many years not to countenance applications for special protection for water and gas mains from electrolysis, owing to the fact that it considers the Board of Trade regulations on the point sufficient, and there seemed to be no peg upon which to hang a "Bermondsey" clause, so it is perhaps for these reasons that the gas company have withdrawn their opposition to the Bill, and the electrical clauses are now going through unopposed.

They give the Corporation powers to lay additional mains, to erect overhead wires, and to construct sub-stations under the streets. No such sub-station, however, is to be constructed within a distance of 25 yards of any railway property or factory, except with the consent of the owners, which, if withheld, is subject to the arbitration of the Board of Trade. Clause 45 provides that if any consumer of electricity supplied under an agreement uses the energy in a manner contrary to

the terms of the agreement, the Corporation may discontinue to supply such consumer.

Clause 46 is a new stand-by clause. It lays it down that the maximum power which any consumer shall be entitled to be supplied with by the Corporation shall not include any supply of energy taken only on extraordinary occasions, or as a stand-by supply, unless such consumer shall pay to the Corporation a minimum annual sum which will give a reasonable return on the capital expenditure involved in meeting that supply. Another clause inserted by agreement with the Gas Company is that the Corporation shall not charge for electricity used for working motors for compressing gas supplied by the Derby Gas Light and Coke Company a higher rate than the highest rate charged for the time being for current for lighting purposes.

## ELECTRIC TRACTION NOTES

A sum of about £1,250,000 has been sanctioned by the Lower House of the Prussian Diet for the conversion of the Berlin City Railway, the Circular Railway, and the suburban lines to electric traction. In the course of the discussion it was stated that the cost of electric working would be £300,000 a year cheaper than steam, and that forty trains an hour could be run instead of the present twenty-four. The City Railway has reached the limit of its capacity by steam working.

In the large number of Bills which have been deposited in Parliament this session authorising the running of trolley omnibuses, a clause was universally inserted giving the Board of Trade powers to sanction further routes upon application by the promoters in the future. The idea of this is to obviate the expense of coming to Parliament again, inasmuch as it is a much cheaper procedure for the Board of Trade to sanction extensions by way of provisional orders. Exception, however, has been taken to this clause in many instances, and especially so in regard to the Metropolitan Electric Tramways (Trackless Trolley) Bill, many of the London local authorities regarding it as a possibility that the Board of Trade could sanction the running of trolley omnibuses in any district without the local authorities being heard. We now understand, however, that at the request of the Board of Trade itself, this particular clause has been deleted from all Bills this session.

Bearing on this question, the following resolution passed by the County Councils Association last week is of interest:—"That it is undesirable that any powers should be included in a private Bill introduced this session to authorise a trackless trolley system or the running of motor omnibuses within an administrative county area (other than exclusively within a County Borough or the County of London), as the reclassification of main and other roads has not yet been made by the Road Board, and that members of the House of Lords and the House of Commons be invited to take such steps as may be necessary to eliminate from private Bills clauses proposing to give such powers."

The General Purposes Committee of the L.C.C. have made a report with regard to Sir Laurence Gomme's evidence before the House of Commons Committee, which is inquiring into the cause of accidents from motor traffic in London. In this evidence certain opinions were expressed as to the appointment of a traffic board for London, which were intended to be personal expressions of opinion, and were not intended to express the views of the Council as a body on this question. The General Purposes Committee, however, are of the opinion that this evidence may give rise to misapprehensions in the minds of some of the members of the Committee, and in order to remove this possible misconception, the Chairman of the Select Committee has been communicated with. At the same time the General Purposes Committee recommend that the Select Committee should receive evidence from Sir Edward White on behalf of the Council on the establishment of a traffic board for London.

The Board of Trade have officially inspected the first trolley omnibus line in Keighley, which is upon the Cedex-Stoll system.

## "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

### Specifications Published April 24, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

8,352/12. **Submarine Telegraphy.** E. RAYMOND-BARKER. For ordinary Morse working a "rocking-beam pole-alternator" is used. This may be polarised or not, but the broader end of a pointed tongue is stiffly pivotted. At each working of the armature of the pole-alternator the tongue impinges upon one side of a stiffly pivotted "rocking beam," and must move it one way or the other. If one current impulse moves it to the left, the next will force it to the right. Either motion closes the circuit of a common local battery. An alternative arrangement is to use a "ratchet-wheel pole-alternator," which takes the place of the rocking beam. It is moved on one tooth by each blow, and commutators fixed to it ensure alternate positive and negative currents. Three figures.

14,157/12. **Armoured Cables.** CALLENDER'S CABLE Co. and C. PIPKIN. To protect wire armouring from chemical effects. A steel or iron wire is enveloped in a lead sheath put on under pressure in a similar way to that adopted for sheathing the insulation of lead-covered cables. The individual wires are then built up to form the armouring in the usual way. Two figures.

14,958/12. **Milk Sterilisation.** A. HELBRONNER, M. VON RECKLINGHAUSEN, and V. HENRI (France). An additional stage in the treatment covered by Specification 14,833/12. This consists in "homogenising" the milk prior to its exposure to the ultra-violet light, and after the preliminary heating by passing it through a filter at about 60° C. under a pressure of approximately 150 kg. per sq. metre.

22,875/12. **High-frequency Oscillations.** K. ROTTGARDT. Highly heated iodine vapour is brought into contact with the discharge gap fed with A.C.

947/13. **Wireless for Air-craft.** L. ROUZET (France). Owing to the difficulty of insulating the antenna winch, the antenna is counterpoised by a carefully insulated network, and the winch is situated at the node. Two figures.

### Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in *italics* indicate communicators of inventions from abroad. Summaries of some of the more important of these patents will appear in our next issue.

**Arc Lamps:** OGILVY-WEBB, WHITE and REINÉCKE, 8,232/12; B.T.-H. (*G.E.C., U.S.A.*) [Electrodes] 16,707/12.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** VAN DAALEN and SCHREIBER [Transmission] 24,122/11; JERRIM [Staples and cable fasteners] 1,933/12.

**Dynamos, Motors, and Transformers:** PRICE [Dynamos and motors] 21,932/12; CONRAD [A.C. rectifiers] 622/13.

**Electrochemistry:** TRIQUET [Sterilisation of water using mercury vapour lamps] 9,314/12

**Heating and Cooking:** BELLING [Geysers] 8,682/12; SCHAEFFER [Hot-air douches] 18,212/12.

**Ignition:** WECKERLEIN & STOCKER [Starting multi-cylinder engines with magnetos] 8,986/12; DELIGNY [Spark plugs] 22,530/12; SIEMENS & HALSKE [Spark plugs] 1,064/13.

**Incandescent Lamps:** FISCHER [Manufacture of drawn tungsten wires] 9,981/12; B.T.-H. (*G.E.C., U.S.A.*) [Machine for manufacturing] 14,962/12.

**Instruments and Meters:** TURNER [Prepayment meters] 13,647/12; A.E.G. [Meters] 16,358/12; MOUL (*Korting & Mathiesen*) [Armature for D.-C. watt-hour meters] 27,246/12.

**Switchgear, Fuses, and Fittings:** CUMONT [D.-C. motor controller] 8,108/12 KOVACS [Cut-outs] 17,635/12; HERRENSCHMIDT & Co. [Automatically reversing tanning-tub operating motors] 20,976/12; HORTON [Switches] 21,102/12; KENNEDY [Regulators for train-lighting systems] 21,157/12; B.T.-H. (*A.E.G.*) [Automatically stopping electric hoists] 26,681/12.

**Telephony and Telegraphy:** WEINTRAUD [Disinfecting telephone receivers] 3,046/12; HARRISON, MOORE and SAVIN [Telegraphy] 5,655/12; CLARKE and CHADBURN'S (SHIP) TELEG. [Revolution tell-tale] 5,692/12; JAMESON [Selectively calling up wireless stations] 19,014/12; VON DER HEIDE [Hollow reinforced concrete masts] 939/13; RICKETS [Telephony] 2,397/13.

**Traction:** MERZ and REDMAN [Railway conductor rails] 13,801/12.

**Miscellaneous:** ALLENKIRCH and GEHLHOFF [Thermo-electric heating and cooling body] 8,050/12; WEIGL [Neutralising effect of inertia of selenium cells] 8,598/12; KINGSLEY-FIELD [Gyro-

scopic apparatus] 13,238/12; DOWNING and MOULTON [Alarm controlling for cash-boxes, &c.] 15,028/12; LA FORCE [Remote indication of level of a liquid in a reservoir] 15,160/12; TRAUTMANN [Burglar alarms] 19,105/12; STERN and BRITISH EVER-READY ELEC. Co. [Packing-envelopes or -cases for batteries] 19,856/12; LILIENTHAL [Röntgen Rays] 23,169/12.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** PORAK [Cable insulating and tensioning gear] 16,671/12; BROWALSKI [Insulator] 7,382/13; SIEMENS-SCHUCKERT. [Loom driving] 7,842/13; A.E.G. [Motor regulation by boosting and bucking machines] 7,896/13.

**Dynamos, Motors, and Transformers:** A.E.G., 7,784/13.

**Electrochemistry:** HELBRONNER [Milk sterilisation] 7,428/13.

**Ignition:** ROYER, 7,302/13.

**Incandescent Lamps:** SANOSCOPI-GLAS. GES. [Glass absorbing ultra-violet light] 7,864/13.

**Telephony:** SIEMENS & HALSKE [Supervisory circuits] 7,531/13.

**Miscellaneous:** BRUNCKO [Clocks] 7,275/13.

### Application for Extension of Term of Patent

8,961/99. **The Telegraphone.** V. POULSEN. Owing to the fact that the Law Officers cannot attend earlier, it was decided last Thursday that the hearing of the petition for extension of term of this patent beyond the customary 14 years shall not take place before May 20th.

### Opposition entered to Grant of Patents

3,878/12. **Ships' Telegraphs.** P. R. KEEPIE and H. M. R. MADDICK. To indicate direction of rotation of shaft two or more rotary switches consisting of rings connected by free wheels to the shaft and free in opposite directions are used. A brush bears on each ring. One ring is thus stationary, while the other revolves.

### Grant of Patent Allowed

21,734/11. **Signalling and Advertising.** C. E. WILLS (ELECTRICAL ENGINEERING, February 27th, p. 122).

### Amendment of Specification allowed

27,697/11. **Burglar Alarms.** A. RICHON. As a result of the extended investigation under Section 8, this specification has been amended by way of disclaimer.

### Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

9,387 of May 4th, 1899. **Detectors for Railway Facing Points.** W. H. DEAKIN and W. ROBERTS. When the points are set and locked, the corresponding circuit controller and lock bolt circuit controller automatically close the circuit of the corresponding signal lever with the exception of a contact switch, so that on the signalman closing this the corresponding signal lever will be unlocked by the electro-magnetic gear, whilst the circuit corresponding to the other signal lever will be open at the lever and at the points so that it remains locked.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Arc Lamps:** E. PEARCE and S. WALTON [Regulating mechanism] 521/07.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** H. PIERER and L'HOEST [Train lighting on the series system, dynamo being driven by separate motor] 695/03; H. C. SOULE [A.C. motor control] 28,017/08.

**Dynamos, Motors, and Transformers:** B.T.-H. (*A.E.G.*) [Starting a single-phase commutator motor having short-circuited brushes] 440/07; F. CONRAD [Mercury vapour rectifiers] 26,555/08.

**Instruments and Meters:** SIEMENS BROS. DYNAMO WORKS (*Siemens Schuckert*) [Maximum demand indicators] 468/08.

**Switchgear, Fuses, and Fittings:** L. K. JOB [Thermal flasher—a brass bar is overwound with the heating coil] 894/06.

**Telephony and Telegraphy:** F. RITCHIE [Controlling pen of teleautograph receiver] 550/04; G. A. M. AGRELL [Type-printing telegraph receiver] 700/08.

**Traction:** W. McLELLAN and C. H. MERZ [Speed and distance recorder for electric trains] 571/05.

**Miscellaneous:** F. and M. P. ROBERTS [Electrically driven flexible diaphragm pumps] 12,364/08.

102, 103 & 104, MINORIES, LONDON

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

On Thursday last week, Mr. A. A. Campbell Swinton made a statement before the Marconi Committee in reference to Mr. Godfrey Isaacs' evidence. Mr. Isaacs had blamed Sir Henry Norman for suggesting Mr. Swinton as a member of the Technical Committee, as a report by Mr. Swinton had been published on a Poulsen prospectus. Mr. Swinton now said that he regarded Mr. Godfrey Isaacs' remark as an attack upon his *bona-fides* as an impartial and unbiassed expert witness. The report he made upon the Poulsen system was an absolutely independent one, and he had never had any connection whatever with the Poulsen Company. He said he regarded the statement in question as ungracious from the managing director of the Marconi Company, as he believed that he (Mr. Campbell Swinton) was the first to give Mr. Marconi introductions in this country when he was totally unknown in commercial and scientific circles. Another resignation from the Committee is announced in consequence of the Hon. Neil Primrose having to accompany the British delegation to America in connection with the Hundred Years' Peace. Mr. Gordon Harvey, a former member of the Committee, who retired on account of ill-health, returns in the place of the Hon. Neil Primrose.

On Monday Mr. Winston Churchill was called before the Committee in respect of a rumour mentioned by the editor of the *Financial News* to the effect that Mr. Churchill had speculated in Marconi shares. Mr. Churchill expressed the greatest indignation at being called before the Committee on such a slight pretence, and emphatically denied that he had anything to do with Marconi shares anywhere, and concluded by stating that any person who said he had was a liar and a slanderer, and that any person who repeated the rumour, at the same time having no evidence and believing it to be false, was in addition a coward. We may mention that a suggestion has been made in the lobby of the House that the Government should take steps to bring the meetings of the Marconi Committee to a conclusion.

In the course of the debate in the House of Commons on Thursday last on the vote for the salaries and expenses of the Post Office, the Postmaster-General said that the deferred rate for plain-language cablegrams across the Atlantic had

resulted in a vast increase in business, and that a system of week-end cable letters at about one fourth the usual rates had been introduced between this country, Canada, South Africa, Australia, New Zealand, the United States and the Argentine. The case of India and the East was under consideration. With regard to the Imperial wireless scheme, station sites had been provisionally selected (subject to the approval of the contractor) in England, Egypt, India, and South Africa. Government representatives were now in East Africa and the Straits Settlements seeking sites for the remaining two stations. Since the transfer of the National Telephone Company to the Post Office the wages of the operating and clerical staff have been increased 25 per cent., and the wages of the transferred staff were now 15 per cent. more, on the average, than they were under the company. Nine thousand subscribers who had been connected with wrong exchanges had been transferred to the right ones, and 5,000 more would be transferred by July, leaving 15,000 to be transferred. The complaints of bad service in London had been reduced by very nearly 50 per cent. compared with the early part of last year. In London 162,000 miles of additional wires had been laid, and 20,000 new subscribers had been connected, and although there was still some delay in providing the telephones asked for, the rate of joining up was 25 per cent. more than was the average last year. Taking the country as a whole, £1,000,000 had been spent on the improvement of the exchange system, apart from the trunk system. Last year 98 new exchanges were opened. This year it is proposed to open 220 new exchanges, several on the automatic system. The trunk traffic increased 9 per cent. over the preceding year. The capacity of the London Trunk Exchange is being increased by about 30 per cent. New telephone cables between this country and Holland and Germany are contemplated. The rural party line scheme is now being taken up with increasing rapidity. About 1,000 residents now use these lines, and 500 more are being connected. The Post Office is erecting a wireless station at Aberdeen, and it is suggested that this should meet the requirements of Dundee and Aberdeen for additional telegraphic facilities, as with the present overhead lines some trouble is experienced during the winter from storms, by providing an alternative route. An Admiralty wireless station already exists at Dundee. For several weeks last winter 3,000 men were employed remedying the damage done by storms in different parts of the United Kingdom.

The Italian Radiotelegraphic station at S. Cataldo (Bari) was reopened for ship service on 22nd April, and the Bagdad-Bassorah line was working again on the 24th, when also the Seattle-Sitka cable failed, on account of which telegrams for Alaska are being sent *via* Ashcroft.—On the same date the cable between Perim and Djibouti was put through.—The Montenegro Administration notified the opening of a telegraph office at Scutari on April 26th.—Notwithstanding the notice of March 10th, some administrations are still routing telegrams "*via* Turkey."—The Moulmein route was down on April 28th between Raheng and Bangkok, and also between Tavoy and Myitta.—Telegrams for Siam are being sent *via* Madras-Saigon at the same rate.—Mr. Theodore Vail is cruising in his private yacht in West Indian waters.

### LOCAL NOTES

**Bognor: Public Lighting.**—As already announced, an electric lighting undertaking of the local Gas Company will shortly be put into operation, and the Council has been asked to consider whether it will adopt electricity in preference to gas for the esplanade and any other streets in the town. The position is an interesting one inasmuch as the Gas Company will be competing with itself in respect of any change that may be made.

**Dudley: Sale of Electrical Undertaking.**—It is stated that a legal difficulty has arisen in connection with the sale of the Dudley electrical undertaking to the Midland Electric Corporation for power distribution. This difficulty, we understand, is with regard to an outstanding capital loan.

**Glasgow: Transporter Bridge.**—It is stated that the Corporation is contemplating the erection of an electrically operated transporter bridge over the Clyde.

**Harrogate: Development of Electrical Undertaking.**—Mr. George Wilkinson, the Borough Electrical Engineer, has prepared a report on the possible development of heating and cooking by electricity, and its effect upon the Corporation's electricity undertaking. He points out that at present practically all the buildings likely to adopt electricity are already being supplied, and that until the borough grows considerably, there is not much prospect of a very considerable development of the private lighting business. He therefore recommends that a tariff should be offered to consumers which would induce them to use electricity for cooking and heating purposes on a considerable scale. He recommends a fixed charge of 2s. 6d. per quarter per kilowatt installed in cooking plant and electric radiators, with a rate of 1d. per unit for all energy consumed, the simple conditions being, that the establishment should be entirely illuminated by electricity.

**Heywood: Loss on Electricity Undertaking.**—A loss of £4,118 is reported on the electricity undertaking for the past year. In the previous year there was a loss of £2,532.

**Leicester: Strike of Wiremen.**—The members of the Electrical Trades Union employed in Leicester came out on strike on Friday for an increase in wages. According to an official note issued by the Employers' Association, only twenty-eight men are on strike, and it appears that the demand is for a minimum of 9d. per hour. The employers, however, state that as in towns like Nottingham and Birmingham the minimum wage is 8½d. per hour, it is unfair to attempt to impose a higher rate in Leicester. The employers have offered to refer the dispute to arbitration, but this has been refused by the men.

**Liverpool: Electrical Sub-Committee.**—As indicated in our columns some weeks back, the Corporation has decided to abolish the Electrical Sub-Committee which had charge of the electric supply undertaking under the Tramways and Electric Power and Lighting Committee. The Sub-Committee was only appointed about six months ago, and there seems to have been an agitation ever since to secure its abolition, and this has now been brought about by the casting vote of the Chairman of the full Committee, Alderman Smith.

**Moffat: Electric Supply Scheme.**—Mr. W. E. Townsend, of Edinburgh, has been instructed to submit plans for an electric lighting scheme. A plebiscite of the ratepayers is to be taken on the subject.

**Salford: Price for Tramway Energy.**—Mr. Robert Hammond has been appointed by the Board of Trade to act as referee to settle the difference between the Salford Cor-

poration and the Eccles Corporation as to the price to be paid by the former for electrical energy supplied by Eccles to a portion of their tramways.

**Swinton: Street Lighting.**—A special committee is investigating systems of street electric lighting.

**Waterford: Electric Lighting.**—We announced a short time ago that the Waterford Gas Company had called in Mr. C. H. Wordingham to advise them with regard to an electric lighting scheme. A Special Committee of the Corporation has now decided to ask the Chief Electrical Engineer of the Dublin, Cork or Belfast Corporations, whichever may be available, to report with regard to a municipal electric supply scheme.

### TENDERS INVITED AND PROSPECTIVE BUSINESS

#### Generating Stations, Sub-Stations, Mains, &c.

**Aberdeen.**—The Secretary for Scotland has sanctioned the borrowing of £80,000 for the Electricity Department.

**Barnes.**—Feeder and distributor cables are required. Borough Electrical Engineer, May 19th. (See advertisement on another page.)

**Blackburn.**—On the advice of Mr. P. P. Wheelwright, the Borough Electrical Engineer, the Electricity Committee has adopted a scheme for the erection of a new power station.

**Felixstowe.**—One 150-kw. Diesel engine driven generating set. Consulting Engineer, R. P. Wilson, 66 Victoria Street, S.W. May 5th.

**Glasgow.**—One 5,000-kw. and one 2,000-kw. turbo-alternator with condensing plant. General Manager, Tramways Department. May 26th.

**Grimsby.**—Extensions to cooling towers and condensing plant, steam, exhaust and other pipework, conduits and distribution boards. Borough Electrical Engineer. (See advertisement on another page.)

**Hamilton.**—Messrs. Buchan & Partners, consulting electrical engineers, have suggested an additional expenditure of £12,000 upon the electricity undertaking, and the Council recommend an application for a loan for this amount.

**Hoylake.**—One 400-kw. generating set and condensing plant. Borough Electrical Engineer. May 5th.

**King's Lynn.**—One 400-kw. generating set and condensing plant. Borough Electrical Engineer. May 5th.

**London: Battersea.**—The Finance Committee of the L.C.C. recommends sanction to a loan of £3,275 for the provision of a boiler and circulating water pump at the electricity works.

**Peterborough.**—One 500-kw. generating set and two boilers. Borough Electrical Engineer. May 6th.

**Port Glasgow.**—The Board of Trade has granted an Electric Lighting Order to the Town Council which will, however, be worked by the Greenock Corporation.

**Rochdale.**—Electrically-driven induced draught plant. Borough Electrical Engineer. May 14th.

**Roscrea (Ireland).**—A local manufacturing firm has decided to instal plant to supply the town with electric light and power. Plans are being prepared by Mr. Lawless, a consulting engineer, of Dublin.

**Southampton.**—Two electric gantry cranes for Harbour Board. Clerk. May 9th.

**Stalybridge.**—The Joint Board has received sanction to a loan of £39,255 for electrical extensions.

**Warrington.**—Traction battery and reversible booster. Borough Electrical Engineer. May 13th.

**Wolverhampton.**—The Council has decided to apply for a loan of £22,000 in connection with the electricity undertaking. The new plant will include E.H.T. ring main feeders, four 250-kw. rotary converters, E.H.T. sub-station switchgear, L.T. sub-station switchgear, cranes, and E.H.T. switchgear for Commercial Road generating station.

### Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

**Barrow-in-Furness.**—Electrical equipment of workhouse at Roose. Architect, H. T. Fowler, Cornwallis Street. May 7th.

**Bootle.**—Cinematograph theatre, Stanley Road. A. Kershaw, Birkdale.

**Coatbridge.**—Cinematograph theatre in Bank Street.

**Darwin.**—New Corporation baths.

**Dundee.**—Labour exchange. H.M. Office of Works, London.

**Haslingden.**—New bank for Manchester & County Bank, Ltd.

**Nottingham.**—Two new cinematograph theatres in Sneinton Road and Parliament Street.

**Stirling.**—New station buildings for Caledonian Railway Co.

**Wallasey.**—A site for a new town hall has been approved. New schools at an estimated cost of £16,000.

### TENDERS RECEIVED AND ACCEPTED

**London: L.C.C.**—The Highways Committee has under consideration tenders for two 8,000-kw. steam turbo-generators which it is proposed to instal in substitution of the reciprocating engines at Greenwich. Whilst the Committee is not yet in a position to advise as to which of the tenders shall be accepted, they recommend the Council to sanction an expenditure on capital account of £82,100 in this connection.

### APPOINTMENTS AND PERSONAL NOTES

It is suggested that in consequence of the appointment of Mr. W. Wyld, the Birkenhead Electrical Engineer and Tramways Manager, to Hampstead, the Corporation will not appoint a successor to Mr. Wyld to the dual post of Electrical Engineer and Tramways Manager. It is stated that the Electricity Committee will recommend Mr. Wyld's chief assistant, Mr. G. P. Shallcross, as Borough Electrical Engineer, at a salary of £400 per annum.

Mr. C. B. Stuart Wortley, K.C., M.P., has been appointed Chairman of the new London & Suburban Traction Co. Mr. Stuart Wortley is, as may be recalled, also Chairman of the City & South London Railway Co.

Mr. J. W. Piggott, mains engineer to the Whitby Council, has been appointed Electrical Engineer in succession to Mr. L. H. King, who has received an appointment with the Marconi Co.

Mr. W. T. Green has been appointed to take charge of the commercial side of the Leeds Electricity Department, in succession to Mr. C. N. Hefford, who as we announced last week has been appointed Manager of the Department.

Mr. Frank Timms, late of Messrs. Armstrong, Whitworth & Co., Ltd., has been appointed to the position of Installation Engineer and Canvasser to the Tynemouth Electricity Department.

Mr. C. H. Nickson has been appointed Clerk of Works for the new generating station at Bolton.

A superintendent of the central car repair depôt of the L.C.C. Tramways Department is required at a salary of £300 per annum.

### CAPPER PASS & SON, Ltd.,

Bedminster Smelting Works, BRISTOL.

SELLERS OF

ANTIMONIAL LEAD OF ALL GRADES.

BUYERS OF

THE LONDON ELECTRIC FIRM, CROYDON  
FOR ALL LAMPS, AND OTHER LIGHT WEIGHTS

### MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith and Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars c.i.f. port of arrival, quoted on Tuesday night, was £71 10s. to £72 (last week, £72 to £72 10s.).

**Liquidations.**—The Electrolytic Alkali Co. is to be wound up voluntarily. Mr. W. H. Alexander, 24 North John Street, Liverpool, is liquidator. A meeting of creditors will be held at 14 Cook Street, Liverpool, on May 7th at noon.

**Bohemian Concert.**—The second annual Bohemian Concert of the General Electric Co.'s Athletic Club will be held on Saturday at the Talbot Restaurant, London Wall, E.C., at 7.30 p.m. The Davis challenge cup, which has been won by the G.E.C. Football Club, will be presented during the evening.

### COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**North Metropolitan Electric Power.**—At a special meeting last week, a resolution was passed extending the borrowing powers of the Company in order to meet further extensions of the Company's two main stations at Brimsdown and Willesden, and also for the extension of the Hertford and St. Albans stations.

**Durham Collieries Electric Power Co.**—Mr. Justice Neville last week sanctioned the selling of this Company to the Newcastle-on-Tyne Electric Supply Co.

**Electrical and Industrial Investment Co.**—This Company is issuing at par £85,180 4½ per cent. first debenture stock and £92,955 5½ per cent. second debenture stock. The Company was formed in May, 1912, to acquire the investments of the City of Birmingham Tramways Co., and generally to carry out the objects of an investment company. A dividend of 4½ per cent. was paid on the ordinary shares for 1912.

**Johnson and Phillips.**—Mr. R. W. Blackwell presided at the annual meeting on Thursday last week, when the report and accounts referred to in our last issue were adopted. Whilst admitting that the report for the past year was not all that the shareholders could properly desire, Mr. Blackwell expressed the opinion that the Company's property was steadily improving in value, and the business regularly increasing along safe and conservative lines. A shareholder, however, wished to know why in these times of unprecedented prosperity Johnson and Phillips had during the past five years had such bad times. The Chairman replied that one of the reasons for this was that at the time of the flotation of the Company the working capital was insufficient for the demands during troublesome times, and business fell off. The Board had, however, struggled to build up the Company, and by not recommending dividends during the past few years had, he believed, attained a considerable measure of success.

**Damages for Electric Shock.**—A switchboard attendant employed by the L.C.C. at their Hammersmith sub-station has been awarded £135 damages at the West London County Court for injuries consequent upon a shock from the 6,000-volt mains. Contributory negligence was alleged by the Council in defence, and the actual voltage was said to have been 3,750.

**Investigation into the Cause of an Explosion.**—The inquest regarding a fatal explosion at Hebburn-on-Tyne, referred to on page 228 of our issue of last week, was continued last Thursday. Evidence was given as to a smell similar to burnt indiarubber after the explosion, and the trough in which the cables were was found to be burned, charred, and part of the cables gone. The surveyor could find no trace of gas, nor were there gas-pipes near. Evidence was given by Mr. W. Bates (Northern Counties Electric Supply Co.), who said that the cables were laid in 1902, and were near the wall of the house. They were laid in wooden troughs in bitumen, and appeared to have been strained in laying, so that one lay on the top of the other instead of side by side. Mr. C. Vernier (Mains Engineer, Newcastle Electric Supply Co.) said that the cable had been fused for a length of about six feet, and that there was indication of the bitumen having been at a very high temperature. Bitumen gas did not usually cause an explosion through contact with the air, but he could find no other explanation than that the fusing of the cable had caused the explosion of gas given off from the bitumen. The jury found that the deaths were due to injuries, the result of accidental explosion of the gas given off by bitumen generated by the fusing of an electric cable.

## SUMMARY

THE L.C.C. has placed a contract with the British Westinghouse Co. for two 8,000-kw. turbo-alternators for the Greenwich power station. (Page 254.)

WE publish an illustrated description of a fine new restaurant inaugurated by the Brompton & Kensington Accessories Co. last week. Its equipment represents an aggregate of 140 kw. The main kitchen contains a long range, including nine electric ovens and 12 boiling plates, and, in addition to the other cooking operations, the bread used in the restaurants is baked here. Electric current is also employed for working the meat-chopper, the coffee-grinder and roaster, &c. In the restaurant itself there is a large double griller, a heated carving-table, and hot cupboards, and there are also two smaller electric kitchens in the building, one a model domestic kitchen, and the other a mess-room for the staff. (Page 255.)

A DESCRIPTION of the delicate electrostatic voltmeters and wattmeter used at the National Physical Laboratory for checking commercial instruments with an accuracy of about 1 part in 10,000 is contained in a Paper by Messrs. C. C. Paterson, E. H. Rayner, and A. Kinnes, which was read and fully discussed at the Institution of Electrical Engineers last Thursday. (Page 257.)

AN electrically-driven ice-making plant is described in a short article. (Page 258.)

AT the adjourned discussion on Mr. Trotter's Paper on the proposed standard street lighting specification,

the basis of minimum horizontal illumination was strongly opposed by the speakers identified with gas lighting. In his reply Mr. Trotter again pointed out the agreement between the observations of the surveyors and photometrists in the street classification described in the Paper, which was strong evidence that the minimum-illumination basis was sound. (Page 259.)

SOME evidences of the strength of modern metal filament lamps are given on page 260.

AN illustration is given of a most successful electric kitchen at the staff dining-rooms of Simplex Conduits, Ltd., Birmingham. (Page 260.)

A PETITION for revocation of a Patent granted to Van Raden & Co., Ltd., and M. Metz for a switch for controlling motor-car lighting circuits on the ground of insufficiency of description of the invention, heard on Monday last, was unsuccessful. (Page 260.)

THE design of a semi-indirect lighting installation for an office is considered in our Questions and Answers columns. (Page 261.)

A NEW design of propeller fan and a motor-car inspection lamp are described on page 262.

MR. SEABROOK calls attention to the fact that all interested in pushing the use of electricity for domestic purposes are welcome to the meeting of the "Point Fives" during the I.M.E.A. Convention week. Further correspondence relates to a system of burglar alarms recently described in our Questions and Answers columns. (Page 262.)

IN connection with tenders for two 5,000-kw. turbo-alternators for the Stepney Borough Council, strong exception was taken to the B.E.A.M.A. model general conditions to which all the British firms tendered, refusing to accept the Borough Council's conditions. The contract has been placed with a Swiss firm, who, however, also tendered the lowest price. (Page 265.)

A MODEL specification for coal purchasing has been proposed by the Associated Municipal Electrical Engineers (Greater London). (Page 263.)

AN exhibition was given last week of Prof. C. F. Dussaud's so-called "cold light." Highly over-run tungsten lamps are rapidly switched on and off, and it is claimed that, owing to the periods of rest, the life of the lamps is not diminished as much as the high efficiency would lead one to expect. (Page 262.)

THE Metropolitan Electric Tramways, Ltd., have received powers to link up their tramway system with the Walthamstow tramway system by means of trolley 'buses. The annual Congress of the Tramways & Light Railways Association will be held at Blackpool on June 12th and 13th. (Page 263.)

SIEMENS BROS. & Co. are seeking leave to amend an important patent specification (No. 20,277/04) relating

to the manufacture of drawn metallic filaments. A specification for some improvements in the Stone system of train lighting expires during the current week after a full life. The specifications published last Thursday include one by C. H. Fischer for the production of tungsten suitable for drawing into filaments, and one by C. R. Belling for an electric geyser. (Page 264.)

THE technical advisory committee appointed in connection with the Marconi inquiry has done far more useful work than the main committee. It reports that the generation of continuous oscillations is not yet sufficiently powerful for the long-distance transmissions that are required, and recommends the use of the Marconi methods at the outset, in view of the excellent results which are already obtained with the Marconi stations. The Marconi Co. and also the Telefunken Co. are already experimenting with continuous oscillation generators, as well as the Poulsen and Goldschmidt companies. The Committee recommends that the Post Office should be free to use for the stations of the Imperial wireless chain any improvements, and should not be confined permanently to the use of any particular system, or be tied by patent rights, and they recommend that two of the stations should be allotted for experimental investigations by an engineer of standing and a competent staff appointed for this special purpose.—Negotiations are proceeding between the Hull Corporation and the Postmaster-General with regard to the purchase of the Post Office telephone undertaking there by the Corporation. (Page 265.)

THE hitch in the sale of the Dudley electricity undertaking is with regard to the repayment of the outstanding loans by the Company which proposed to purchase the works.—Arrangements for wiring small houses are being entered into at Kilmarnock.—A tariff has been fixed at Bexley to develop electric cooking. (Page 267.)

OUR Tenders Invited column gives particulars of a considerable number of prospective orders for electrical machinery. Among the sums contemplated to be spent may be mentioned, £35,900 at Salford; £13,500 at Derby; £500,000 at Birmingham; £7,000 at Keighley; £5,700 at Shipley; £3,000 at Bridlington; whilst new generating plant is also required at Plymouth and Brighton. A number of Councils who have just received electric lighting provisional orders also propose to proceed with them immediately. (Page 267.)

THE Derbyshire & Notts Electric Power Co. has now been placed upon a sound financial footing, and orders for a considerable amount of plant have been given.—The Westinghouse Co. is able to carry forward a credit of £66,889. (Page 268.)

**Indirect Lighting in a Fruit Warehouse.**—The British Thomson-Houston Co., Ltd. (Mazda House, Upper Thames Street, E.C.), have sent us some particulars of yet another example of a lighting installation on their "eye-rest" indirect lighting system. This time it is a fruit warehouse that has taken advantage of the well-diffused and comfortable illumination that can be obtained by this system. Messrs. Elders & Fyffes, the large fruit importers, of 31 Bow Street, W.C., have had the eye-rest system installed throughout their offices and warehouse for several months, and it has given satisfaction both as regards illumination and current consumption. Plain brass bowl Eye-Rest fittings are employed, each containing four 80-watt Mazda lamps. The illumination in the offices and warehouse is uniform and glareless, and of high intensity. Eye-rest lighting has considerable advantages in a warehouse. The store-rooms are generally filled with stacks of baskets and crates, which with direct lighting would cast long, dark shadows. Eye-rest illumination is practically unaffected by such conditions, and men can walk between the crates and examine the markings on them without having to strike matches or put themselves into uncomfortable postures.

## LONDON COUNTY COUNCIL TRAMWAYS Various Turbo-Generators Temporary Arrangements for Bulk Supply

SIXTEEN tenders have been received by the L.C.C. for the two 8,000-kw. turbo-generators and auxiliaries required for the Greenwich Power-house. We gave some particulars of the contents of the specification in our issue for February 27th, p. 117. The tenders received were as follows:—Escher, Wyss-Siemens, £48,012; Westinghouse-Westinghouse, £50,532; Willans-Siemens, £50,560; Richardsons, Westgarth—Brown, Boveri, £51,610; Fraser & Chalmers—Brown, Boveri, £52,939; Willans—G.E.C., £53,710; Willans—Dick, Kerr, £53,720; Fraser & Chalmers—Siemens, £54,839; Richardsons, Westgarth—Siemens, £54,861; Howden—Siemens, £55,342 10s.; Richardsons, Westgarth—G.E.C., £58,259; Fraser & Chalmers—G.E.C., £58,889; Brush-Brush, £60,500; Parsons-Parsons, £64,339; B.T.H.—B.T.H., £70,224; Bellis & Morcom—Siemens, £70,770. The estimate of the Chief Officer of Tramways was £62,500.

The above prices are subject to a bonus or penalty on steam consumption, at the rate of £500 per tenth of a pound of steam less or more than 12.75 lb. per kw.-hour at full load. Having regard to the very great importance of obtaining the best possible type of plant for the generating station, Sir Alexander Kennedy was asked to advise on the tender, and as the result has advised that the second lowest tender, that of the British Westinghouse Co., amounting to £50,532, should be accepted. This Company's guaranteed steam consumption is 12.44 lb. of steam per kw.-hour at full load. The corresponding figure offered by Messrs. Escher, Wyss & Co. is 12.82 lb. per kw.-hour, subject to an allowance of 3 per cent. either more or less. On the assumption that both sets of figures were obtained in actual operation, the extra steam required by the two Escher-Wyss turbines would represent an additional expenditure for coal of about £1,500 a year at present prices. An additional provisional sum of £4,000 for transformers will be included in the contract. The Westinghouse Co. stipulates that certain modifications shall be made in the clause usually inserted in the Council's contracts as regards the submission to arbitration of any disputes arising thereunder. This clause, however, is substantially in agreement with the standard clause in the Council's usual form of contract.

Before any alteration can take place at the station, one of the reciprocating engine sets will have to be removed. As the load at the night and morning peaks, however, makes it necessary for the existing four turbines and three reciprocating engines to be constantly working in parallel, leaving one reciprocating engine as spare, there will, until one of the new turbines is available, be no spare plant. In these circumstances, the Highways Committee recommend that an arrangement should be entered into with the London Electric Supply Corporation for a temporary supply of power up to 2,000 kw. at the rate of £3 per kw. per annum, plus 0.3d. per unit for a period of not less than nine months. The supply would be taken at the New Cross sub-station. The Company will provide the necessary measuring instruments and meters, and a cable-duct between their power-house and the Council's line of ducts. The Council, on the other hand, will provide the trunk main between the switchgear at the New Cross sub-station and the Company's generating station at Deptford, at an estimated cost of about £2,060.

The Committees' recommendations were adopted at the meeting on Tuesday.

**Paris Meeting of the Institution of Electrical Engineers.**—The following is a full list of the Papers that will be discussed at the joint meeting of the Institution of Electrical Engineers and the Société Internationale des Electriciens in Paris from May 21st to 24th:—"High-tension Continuous-current Traction," by Gratzmuller; "Single-phase Traction," by M. Latour; "The Electrification Schemes of the Chemin-de-Fer du Midi," by M. Julian; "The Electrification of the Paris Suburban Lines of the State Railway," by A. N. Mazen; "Railway Electrification Problems in the United States," by H. Parodi; "Petrol-Electric Motor-trains," by J. B. Damoiseau; "Long-distance Transmission of Electric Energy (Continuous-current)," by J. S. Highfield; "Long-distance Transmission of Electric Energy (Three-phase Current)," by M. Leblanc; and "Automatic Telephony: Application of Mechanical Devices to the Assistance of Manual Operating in Telephone Exchanges," by W. Slingo.

whether a municipal electricity undertaking could establish a public restaurant adjoining its showrooms without obtaining special parliamentary powers, but it is conceivable that this might be arranged by contract with a firm of caterers. In the case of an electricity supply company the business of restaurant keeping may in the same way not be within the “objects” set forth in the memorandum of association, but an affiliated company can be formed for this purpose, as in the present case.

To return from this digression to the restaurant itself and the equipment of the kitchen, &c., we may first mention that electricity is employed not only for cooking, but also for baking the bread, for all the heating, ventilating, lighting, cleaning, for working the refrigerating plant, and even for running the clocks and for the table bells.

The electrical equipment has been supplied by various manufacturers to the design and specification of the accessories company. The experience gained by the company at the “Queen’s Head” Electric Restaurant, Earl’s Court Exhibition, last summer, and the results obtained on their own and consumers’ premises during the past three years, has enabled them to produce apparatus which is suitable for the purpose in view and able to stand up to its work under everyday conditions.

A general view of the main room of the restaurant is seen in Fig. 1: there are also several tables on the gallery, and there is another room used as a tea-room. The total seating capacity is 90 to 95. The main kitchen is on the first floor, but there is in addition a large double griller at the back end of the main room (seen in Fig. 1), together with a carving table and hot cupboard, and in the servery behind this are electrically-heated urns for supplying tea and coffee. Hot plates are fitted throughout the establishment, and at each table is a pair of 5-ampere plugs controlled by a “twinob” switch to enable the visitors to make their own toast or to experiment themselves with chafing dishes or other small pieces of apparatus if they desire. These plugs, as well as the one for lighting a candle-lamp on the table and the bell-push, are neatly and conveniently arranged. A lamp indicator board in connection with the bell system is placed in the servery.

The equipment in the main kitchen comprises one large cooking suite, having a loading of 70 kw. controlled by fifty-eight switches. As seen from Fig. 2, there are nine ovens in the lower part; these are of various sizes and loadings for different cooking operations. At the right there are two steamers for vegetables, fish, puddings, &c., and, immediately adjoining, ovens for baking all varieties of bread and rolls required in the restaurant. At the left-hand side there is a large fish fryer, adjoining which is a grill and toaster. On the main hob are fitted twelve boiling plates of various sizes and loadings. Running along the top of the suite are switch indicator lamps, and immediately underneath are hot cupboards for silver. Plugs for immersion heaters are provided on the ranges.

The other equipment in the main kitchen comprises a coffee roaster, a meat chopper, a coffee grinder, a bain Marie, a fish kettle, a stock pot, an egg boiler, &c., all electrically heated or driven. The switches are in all cases immediately by the apparatus they control.

The hot water supply in the kitchen and scullery on this floor is supplied by a “Cooper” water heater.

There is also on the first floor a small model kitchen fitted with the usual pattern of domestic stove, and in the basement is a mess-room, with another electric range, where the restaurant staff, numbering about eighteen, will have their meals served and cooked. Both these installations will be shown under ordinary working conditions to visitors.

The basement also contains the refrigerating plant for supplying the cold chamber and for making ice, and a 100-gallon Cooper immersion heater supplying hot water for general purposes. This is controlled by a thermostat, which switches on when the temperature drops to 120° F. and off at 130° F. The ventilating arrangements comprise duct-work, by means of which the air is drawn in from outside, cooled in summer and warmed in winter and delivered to the restaurant through gratings, being afterwards exhausted by means of motors situated on the roof of the building.

The loading of the total electrical equipment is approximately 140 kw. There are two sub-stations in the basement, each containing two 50-kw. transformers. These sub-stations also feed into the network. The pressure is 100 volts

alternating. Arrangements for metering all the circuits through the building are very complete and will enable accurate data to be obtained.

The lighting has been as well thought out as the cooking arrangements. In front of the restaurant and offices there are two lamp-posts of the pattern introduced by the B.T.-H. Company for their "white way" system. Each has four 100-watt and one 200-watt lamps. The main restaurant, in addition to the table lights, has three fine semi-indirect "Alba" fittings, each containing a 200-watt lamp. There is a dimming choking-coil in series with these. The other rooms are chiefly lighted with ceiling lamps and holophane shades; in one of the passages concealed cornice lighting is most effectively employed, and a glass-shelf cupboard for cakes, &c., in the tea-room is prettily lighted up by concealed "tubolite" lamps.

## ELECTROSTATIC POWER MEASUREMENT

**T**HE Use of the Electrostatic System for the Measurement of Power" was the title of a Paper read on Thursday last before the Institution of Electrical Engineers by Messrs. C. C. Paterson, E. H. Rayner, and A. Kinnes. After a brief historical survey, the authors state that they have used the electrostatic system for all their A.-C. measurements at the National Physical Laboratory for over six years. The instruments consist of voltmeters and a wattmeter, together with the supplementary apparatus for testing and checking commercial instruments. The accuracy obtained is considerably better than five parts in 10,000, and the instruments are adaptable for use over a wide range—currents up to 3,000 amperes are now measured, and larger currents could be dealt with. Other advantages are: the fact that the voltmeter and wattmeter require only a minute capacity current, so that they can be changed over from one circuit to another without causing any disturbance; eddy currents do not arise; the instruments are independent of frequency or wave-form changes, however a correction for the inductive effects of the shunts, about 0.8 per cent. for 3,000 amperes, is necessary, and the instruments are of the direct deflection type. The disadvantages are the small controlling force, and therefore slow movement of the moving system, and in order to keep down the time of swing of the wattmeter moving system (undamped) to about 8 seconds, and yet leave the instrument robust enough to stand ordinary everyday use, it is desirable to work with a pressure of about 2 volts on the quadrants for full deflection over the scale. This means that a pressure drop of 1 or 2 volts is wanted whatever be the current through the series resistance. The dissipation of 4 kw. in the resistance is readily managed with water cooling, but this must be regarded as a disadvantage. Considerable benefit, however, accrues, as they form a good non-inductive load for the transformer and generator supplying the current, and thus help to prevent wave distortion of the generator and to keep three-phase circuits balanced. Their relatively high resistance also helps to produce a low time-constant. The instruments are not portable.

The actual apparatus consists of a 160-volt standard horizontal Kelvin and White multicellular voltmeter, with oil damping. A 20-mm. diameter concave mirror with a radius of curvature of 3 metres reflects a beam of light from a Nernst lamp on a scale 4 metres away and 8 metres long. Pressures can be read to an accuracy of 1 part in 10,000. The wattmeter consists of a brass ring 23 cm. diameter and 9 mm. thick. On this ring is centred a platform carrying the whole of the instruments, and free to be rotated bodily by a tangent screw. The moving system is suspended from an upper platform and can be moved laterally to facilitate centring the needle in the quadrants. The needle and quadrants are made of a special copper-aluminium alloy. The diameter of a set of quadrants, of which there are four, is 12 cm., and the slots are 0.5 mm. wide. Amberite insulation is used, and adjustments in height can be effected to 0.001 mm. The moving system consists of a phosphor-bronze strip 20 cm. long annealed in a reducing atmosphere under slight tension. An iris diaphragm is fixed so that when unshipping the instrument to change the needle or make some other adjustment, it is only necessary to take the weight of the needle by means of a screw, disengage the hooks, and close the iris diaphragm on to the spindle. This enables the whole of the top of the instrument to be lifted off without straining the suspension in any way. The upper quadrant system can then be raised, and the needle with its short spindle is ready to be removed. The concave mirror has a radius of curvature of 3 metres, and is 20 mm. high and 8 mm.

wide. The making of the needle requires great care, since any lack of symmetry will cause an uneven scale calibration. The accuracy desired in the measurement of power necessitates an angular deflection through 45 degrees. The needles are 50 mm. across, and are of double fan shape. They are now made from an annealed copper-aluminium alloy 0.015 mm. thick, and are fluted so as to give sufficient rigidity and to increase the damping. The moving system comes to rest after  $1\frac{1}{2}$  complete oscillations.

For the measurement of current above 500 amperes a step-up transformer with a ratio of 1 to 100 or 1 to 200 is connected across a standard resistance carrying the current to be measured, and an electrostatic voltmeter is connected across the secondary. The authors have found that, instead of tending towards a constant value as the frequency increases or the wave-form varies, the transformation ratio continues to rise. It was found that for the particular transformer used and for frequencies between 25 and 100 cycles, a resistance of 143,000 ohms, with a positive temperature coefficient, across the secondary checked this tendency, except for the small variation due to the variation of the magnetising current with frequency, and this only affects the reading 0.08 per cent. The core of the transformer is a split laminated ring of 16 sq. cm. cross-section and 16 cm. diameter. The secondary winding is made in twenty wedge-shaped sections of 2,000 turns each, so wound that they fit closely round the core when in position. The primary is in four sections of 100 turns each. Series, parallel or series-parallel connections may be used.

Appendices to the Paper deal with the troubles due to use of ebonite for electrostatic measurements, the design of instrument scales, and a bibliography.

## DISCUSSION.

Professor E. WILSON (King's College), in opening the discussion, asked what had been the experience of the authors with measurements at very low power-factors—say, below 0.1. About two volts were lost in the shunts, and, to get a deflection not too small, the volts on the instrument had to be increased, so that more energy had to be dissipated. If his instrument was used, one could get down to very low power factors.—The instrument referred to was invented by Professor Wilson and Mr. J. S. Highfield, and instead of shunts being used, the currents circulate in two air-cone coils, thus producing a vertical field, in which is revolved an armature at a known fixed speed by another motor, and the pressure produced by this charges the needle of a high-pressure electrostatic instrument whose quadrants are charged by the pressure of the circuit. This instrument has a large distance between the fixed and moving parts, a very wide range, and is very robust.

Mr. J. S. HIGHFIELD (Chief Engineer and Manager, Metropolitan Electric Supply Co.) referred to the importance of having instruments in power stations capable of measuring large amounts of power with considerable accuracy. The Wilson-Highfield instrument was very suitable for this work, as transformers were dispensed with.

Mr. G. L. ADDENBROOKE thought that the reason electrostatic instruments had so far not been much developed was because people generally had regarded the Kelvin electrometer as the last word in this kind of apparatus, and also because electrostatics was not now taught so thoroughly as formerly. By regarding many phenomena from the electrostatic side instead of from the current side, a much better idea of the distribution of potentials was kept in mind. He found that if large air-condensers were used, the electrostatic wattmeter could be used for very low power-factors. Though he started by using a two-volt drop, he now preferred only a 1.5-volt drop, as water cooling could be dispensed with if an oil bath was used. An accuracy of 1 part in 500 was quite sufficient for most purposes.

Mr. A. P. TROTTER doubted whether it was sound practice to use a single instrument for so many purposes. He did not think it advisable to calibrate the middle of the scale, as with a uniform curve the zero error could be assessed at any part of the scale. Mr. Addenbrooke's instruments were used, he knew, in a number of large works for testing purposes.

Mr. A. CAMPBELL (Principal Assistant, National Physical Laboratory) said that people did not generally appreciate the difficulties in the design of direct deflection instruments. He was pleased to see that the step-up transformer had been brought to such a high state of perfection. The inherent difficulty was that the primary self-induction must be as high as possible so that the number of secondary turns becomes excessive, and it is ready to resonate with a very small capacity across the terminals, the capacity of a few yards of flux often giving an error as much as 5 per cent. It was also impossible to avoid the effects of distributed capacity, and so errors due to resonance with harmonics came in. It was quite an easy matter to construct such transformers, but the authors' design gave an improved space-factor over his designs. He would like to know how much was the zero creep and how much the new standard wattmeter was better than the Kelvin voltmeters.

And at MANCHESTER, GLASGOW,  
and NEWCASTLE.

Mr. R. W. PAUL asked whether the cylindrical system had been considered by the authors, what was the capacity between needle and quadrants, and how much larger was it than with the cylindrical system of Ayerton and Mather. He thought that the period of the instrument was so long that it might be a disadvantage.

Mr. J. T. IRWIN (City and Guilds, Engineering, College) remarked that it was a big step to calibrate the wattmeter on unity power-factor and then use it for low power-factors, as the electrostatic wattmeter only read correct at zero and unity power-factor, since in addition to the spring control there was a certain control due to the voltage of the needle. He suggested a test turning the torsion head and calibrating at different voltages. He also showed how, by two tests, using an air condenser and a quadrature transformer, the effects of frequency and wave shape, if any, could be detected.

Mr. S. W. MELSOM (National Physical Laboratory) spoke of the insulating qualities of ebonite as affected by light, and the necessity for having a perfectly smooth surface to obtain constancy.

Professor J. T. MORRIS (East London College) asked what precautions were taken to get an alternating current with an accuracy of 1 part in 10,000.

In addition Mr. F. H. Nalder, in conjunction with the other speakers, expressed appreciation of the accurate work which had been accomplished by the authors, which, he said, was so perfectly done there was nothing to criticise. Mr. C. C. Paterson, in reply, said that it was doubtful whether it would be safe to raise the volts much above 10, as, above this, tilting of the needle was likely. It was not good to use 10,000 volts direct on an instrument, as these pressures were not often met with, and calibration was difficult. They used two volts because sufficiently robust control was obtained, but in Berlin 0.1 volt on the needle was used. They reckoned to have all their apparatus correct to 1 part in 10,000. The constancy of the current was obtained by driving the alternator, provided with heavy flywheels, by batteries. The field current was led into the motor through discs revolving in mercury. The zero creep due to the phosphor bronze suspension was fairly constant at about 3 mm. or less per full-scale deflection after 15 minutes. They had not considered the cylindrical system very carefully, as the temperature coefficient did not only depend on the length of the suspension. He did not think that Mr. Irwin's suggestions were correct. They had found that the change in constant was only 0.2 per cent. for a 10 per cent. voltage change.

## AN ELECTRICALLY DRIVEN ICE PLANT

THE Port of Blyth Steam Fishing and Ice Co., Ltd., are the owners of a large number of steam trawlers, and have their headquarters at Blyth, Northumberland. The preservation of the fish calls for a considerable amount of ice, and the Company have their own ice plant at Blyth Harbour, which is entirely electrically driven. Three-phase current is taken from the mains of the Northern Counties Electric Supply Co. at a pressure of 11,000 volts 40 cycles, and transformed down on the premises to 440 volts. The compressor room contains a five-panel distribution switchboard and four ammonia compressors by The Linde British Refrigerating Co., Ltd., each pair of which is belt-driven by a 30-h.p. slip-ring Westinghouse induction motor, running at 575 r.p.m., controlled by a liquid starter. Pipes from these machines are taken to the condenser coils on the roof of the buildings, over which sea water from the harbour is pumped by centrifugal pumps, belt driven by 11-h.p. squirrel-cage motors, running at 760 r.p.m. Upon leaving the cooling coils, the ammonia, now in a liquid form, is passed through an expansion valve, so that it is again gasified and lowered in temperature. It is then led to coils which are disposed in the brine tanks. Having abstracted heat units from the brine, the gas is again taken to the inlet side of the compressors. The brine—chloride of calcium in this case—is kept in circulation around the ice moulds in the freezing tanks by means of impellers operated through countershafting by 8-h.p. motors, one for each tank. Each row of ice moulds in the icemaking tanks is held together by means of a light steel framework, which is mounted on wheels running along rails in the tanks. When each row of frozen moulds is removed at one end of the tank, the remaining rows are pushed forward to allow this row to be replaced after the ice has been tipped and the row of moulds refilled. The rams which push the moulds forward are driven by the 8-h.p. brine impeller motors, through belts and gearing, the rams being advanced, returned and thrown out of action by the movement of a single lever. Each icemaking tank is served by a 4½-ton overhead travelling crane, by Messrs. Babcock and Wilcox, driven by a 4-h.p. slip-ring motor. After each row of moulds is lifted from the brine tanks it is dipped for a few seconds into a tank containing hot water, in order to loosen the ice in the moulds. Upon its removal from the hot-water bath the row of moulds is dropped into a hinged trough, when the crane is lowered and the contents of the moulds tipped. The hoists for handling the ice on the floor of the freezing room are driven through gearing by 1½ B.H.P. 750 r.p.m. squirrel-cage motors. Two ice crushers, together with creepers delivering ice at the quay side, are together driven by 15-h.p. 750-r.p.m. motors.

The machinery repair shop, woodworking shops and forge are located in a building close by the ice plant, and are driven by two 15-h.p. motors. The Company carries out most of its own repair work, in addition to making and mending ropes, nets, and other adjuncts of the fishing industry.

The power wiring consists of three-core paper lead-covered and braided cable supported on insulators. This system was chosen on account of the amount of moisture which is always present. It has also the advantage of reducing the "drop" along the cables, and makes a much neater arrangement of the wiring than is possible with single-core conductors, which are apt to become unsightly when a large number of individual motors are supplied from a common distribution box. The motors are sectionalised into two sections at the main switchboard, and the motors for each pair of compressors are controlled from a special type of distribution box. An ammeter and plugging arrangement is provided so that the current taken by each motor can be observed. Each box is of the three-phase type, and the outgoing terminals of the fuses are connected to special terminals at the front of the slate, so that connections can be made without any difficulty.

Altogether the plant is a most interesting one, and reflects great credit on the Linde British Refrigerating Co., its owners, the consulting electrical engineers—Messrs. Tennant and Barrs, of Newcastle, and the British Westinghouse Co., to whom we are indebted for the above particulars.

**Electrical Trades' Benevolent Institution.**—It will be remembered that at the Festival dinner, Mr. E. Byng offered to contribute £100 to the funds of the Institution if nine other persons or firms would do the same. Mr. G. Sutton and Mr. Hugo Hirst's donations of this amount have already been announced, and Mr. Emile Garcke has now also promised £100, making in all £400 out of £1,000. We hope that the remaining six donations of £100 will be speedily promised, as Mr. Byng's offer only holds for three months after the announcement was made.

## STREET LIGHTING SPECIFICATIONS

THERE was another long discussion upon the proposed standard clauses for inclusion in the specification of street lighting at the adjourned joint meeting of the Illuminating Engineering Society, Institution of Electrical Engineers, Institution of Gas Engineers, and Institution of Municipal and County Engineers, on Tuesday, April 29th. The previous discussion was reported in *ELECTRICAL ENGINEERING*, April 17th, page 218.

The adjourned discussion was opened by Mr. F. W. GOODENOUGH (Gas Light & Coke Co.), who laid down the requirements for a specification on which to invite tenders for street lighting as follows:—A basis easily comprehensible by members of local authorities, a standard with which "the man in the street" is familiar and can understand, and general, not limited, application. Such a specification should, he said, be so framed that it was not open to being interpreted in such a way that the lighting of a street was reduced to an absurdity whilst the specification was strictly complied with, and it should leave nothing to the discretion of the contractor. There should be no qualifying or descriptive clauses which leave to the lighting authority the decision of which scheme would prove most satisfactory for the lighting of the streets in question. Otherwise the whole object of adopting a "Standard Specification" would be defeated. Again, the provisions for making the tests, upon which penalties for deficiency are to be based, should be such as to secure as far as possible precision of result. In his opinion the draft specification failed to comply with any one of these requirements. He doubted whether one Councillor in a thousand could be made to understand what was meant by saying that the streets in his district would be lighted with a minimum illumination of 0.025 foot candles on a horizontal plane at a height of 3 ft. 3 in. above the ground level. There was no good reason why limits of specific candle-power should not be adopted as the basis of the street-lighting specification, and on this method streets could be graded into classes in which lamps of a specific candle-power would be placed on columns at a specific height and at a specific distance apart, according to the class. The argument of the advocates of the draft specification, that local authorities were out to buy illumination, was only using words to confuse ideas. The local authority wanted illumination as an effect, and to secure that effect lamps of certain candle-power at certain heights and distances apart were needed. If they did not work upon this basis there was the possibility of very small units of light being placed on very high columns wide apart, which would give the same minimum horizontal illumination as lamps of greater candle-power on lower columns at the same distance apart, or as lamps of the same candle-power on lower columns nearer together. Dr. L. Bloch, of Berlin, had expressed the opinion that the prescription of a certain minimum illumination alone was not sufficient to ensure a well-lighted street, and in further support of his own objection to the proposed specification, Mr. Goodenough also quoted Dr. Louis Bell. If the joint committee would abandon the proposed "unit of measurement clause," he said, and substitute one providing for rated candle-power of lamps determined by direct readings at specified angles, in a specified term, with a specified relationship between rating at the widest and narrowest angles, and would provide a schedule showing by what principle the arrangement, height, spacing, and placing of lamps of specified candle-power, the illumination of streets in different classes would be obtained, then a specification of real practical value with a true scientific basis would be provided. The draft specification, he concluded, was suffering from science run mad; it had the atmosphere of the laboratory and not of the street, and he asked the joint committee to come down to practical conditions and considerations.

Prof. J. T. MORRIS, referring to opinions of well-known men on the Continent and in America, suggested it might be possible to arrange for minimum horizontal illumination, plus either the average or the mean hemispherical candle-power given by the lamps.
